

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

ALFRED RUSSEL WALLACE, LL.D., D.C.L., F.R.S.

AN
ILLUSTRATED WEEKLY JOURNAL
OF
Horticulture in all its Branches.

Founded by W. Robinson in 1871.

EDITED BY MR. E. T. COOK.

VOL. LXIV. CHRISTMAS, 1903.

LONDON.

Office: 20, TAVISTOCK STREET, COVENT GARDEN, W.C.

Published by HUDSON & KEARNS, 20, Tavistock Street, Covent Garden, W.C., and by
Messrs. GEO. NEWNES, Ltd., 7-12, Southampton Street, Strand.

— TO —

ALFRED RUSSEL WALLACE,

LL.D., D.C.L., F.R.S.

THE SIXTY-FOURTH VOLUME OF "THE GARDEN"

Is dedicated.

THE exalted place in Natural Science occupied by Mr. Alfred Russel Wallace is well known, and it will be remembered that in the middle years of the last century he was independently considering the natural forces that were the causes of the evolution of Species, on much the same lines as those that were at the same time being studied by Darwin.

His conclusions on this subject, the results of his arduous journeys, and his researches in the many branches of Natural History are recorded in his books "Travels on the Amazon" (1853), "Palm Trees of the Amazon" (1853), "The Malay Archipelago" (1869), "Natural Selection" (1876), "Tropical Nature" (1878), "Darwinism" (1889), and others.

Born in 1823 at Usk, in Monmouthshire, and educated at the Hertford Grammar School—in his mother's native town, where the family came to live about 1828—Mr. Wallace set forth at the age of twenty-five on the first of his tropical journeys.

His lifelong delight in the beauty of flowers has led him to their care and culture as his most sympathetic recreation. Mr. Wallace is an ardent and accomplished gardener, and it is in this capacity mainly that he has given his portrait and accepted the dedication of the present volume of THE GARDEN.

INDEX.

A.

Abelia rupestris, 328
Abies concolor argentea, the new, 95
Acanthus latifolius, 15
Acer Pseudo-platanus albo-variegatum, 24
Achimenes, 170; *tubiflora*, 39
Aconitum, the, 339
Adiantum cydoniifolia at Edinburgh, 439
Aethionemas, the, 394
Agapanthus insignis, 67; minor *mooreanus*, 163; notes on the, 76
Agaricus, the, 186
 Agricultural College, South-Eastern, 246
 Agriculture, new Director of, Bombay, 90
Allanthus glandulosa in the flower garden, 196
Akalia lobata, 370; in fruit at Newstead Abbey, 311
Allamanda violacea, 230
Alleys, green, and groves, 152
Allium maritimum, 316
Aloe, the, 47
Alonsoa Warscewiczii, 247
 Alpine flowers at Comely Bank, Edinburgh, 240; in August, 206; house in autumn, the, 193; house plunging materials, 160; rock garden, seedlings for the, 110
 Alpines in a wet July, 111; notes on some later-flowering, 182
Amaryllis Belladonna, 328
Ameryllides, 64
America, jottings from, 206
Anemone, 303
Anemone capensis, 54
Andromeda arbores, 181
Androsace lanuginosa, 378
Anemone alpina, 222; in the Alps, 397; polyanthes, 43; sulphurea, 222
Anemones, 243; and *Ranunculus*, 118; from seed, 190, 207; raising, from seed, 116; St. Brigid, 350
Anemone *macrophylla*, 89
Angelonia grandiflora alba, 295, 351
 Annual, a rare sweet-scented, 162; and biennial, 298
Antirrhinum, striped, 292
 Appeal from Baron Sir Henry Schröder, Bart., 407
 Apple and Pear, the summer pruning of, 138
 Apple Beauty of Kent, 239, 272; blossom, 181; Cellini Pippin, 227; Crab, a new—The Langley, 231; crop, a good, 178; Lane's Prince Albert in 1903, 372; Lord Grosvenor for amateurs, 139; new, Middle Green, 292; new, Norfolk Beauty, 373; plague, a common, 172; trees, choosing, 318, 341
 Apples for small gardens, 314; new, and their keeping qualities, 310; too many varieties of, 414
Aquilegia coerulea, 284; *glandulosa*, 27, 284; *longissima*, 284
Aquilegia, 31; notes on the, 284
Araucaria imbricata fruiting, 289, 322, 391
Areca Catechu, 282
Argemone grandiflora, 182, 230
Aronia floribunda for its foliage, 312
Artemisia arborescens, 331; *lactifolia*, 203
 Artichokes, Globe, 64, 344; Jerusalem, 382
Asparagus, 272; beds, 64, 417; forcing, 323
Aspidistra lurida, 29
 Aster Elsie Peiry, 213; mongolica, 332; Perry's White, 213; *salicifolia* Treaserve, 330; *sinensis*, 194; *Tridacanti* in pots, 390; Winnie Weaver, 230
 Asters in the west, 179
Aubrietia, 3
Auchincula, Ayr, 247
Auricula, Polyanthus, and Primrose, the autumn bloom of, 423
Auriculas, border, 398
 Autumn garden, the, 255; gardening, 220
Azalea, seedling, 206
Azara microphylla, 2

B.

Babiana, 215
 Baden-Baden, notes from, 90, 232
 Bamboo, the, 74, 254
 Bamboos flowering, 37, 38, 74, 76, 127
 Banana culture, 122
Banksia suaveolens, 351
 Battersea Park, 235, 326
 Beale, William, 308
 Bean, a new Runner—Hackwood Success, 173, 189; Runner, Smith's Oriental, 247, 289; the Broad, 289
 Beans, 188; Broad, 189, 332; in pots, 304; Runner, 87, 197, 242
 Bedding plants, propagating, 170
 Beeches, Weeping, 167
 Beetroot, 226
 Beets, Turnip-rooted, 139
Begonia carinata, 197; for baskets, a new, 97; Gloire de Lorraine, 324; and vars., 188; Gloire de Sceaux, 188; Lafayette, 128, 146; Marie Bouchette, 103; *sociotrana*, 80; tuberous, 37; t., as an autumn flower, 196

Begonias for winter flowering, 16; the hybrid, 418; tuberous, 361; t., Messrs. Ware's, 324; tuberous-rooted, 361; uncommon bedding, 123
Benthamia fragifera, 135
 Berkhamsted, notes from, 322
Besera elegans, 216
 Biennial, 137; and annuals, 208
 Birria, British, slaughter of, 294
 Birmingham Botanic Gardens, the new Curator of the, 74
 Blackberries and allied fruits, 25
 Blackberry season, the, 162
 Black Currant bud mite, the spread of, 372; new, Bookoop Giant, 147
 Bickling Hall, Norfolk, the gardens at, 267
 Blooms, big, 331
Bönningshausenia albiflora, 295
 Boletii, the, 186
 Books, 4, 121, 204, 363, 402, 414
 Border, flower, a well-coloured, 406
 Borders, grass path, 375; inside, 417; mixed colour schemes in, 416; outside, 417
 Bothies, modern, 266
Bougainvillea glabra, 353
 Bouvardia King of Scarlots, 197
 Bouvardia, 30, 242; planted out, 439
Bravoa geminiflora, 249
 Bread Fruit, the, 71; Nut, the, 254
 Briars, hedge, 382
 British plants, uses of, 97, 135, 153, 248, 267
 Broccoli, 323; Michaelmas White in autumn, 402
 Brockwell Park, 326
 Brooms, the larger, 251
Browallia speciosa major, 385
 Brown, Mr. T. W., 279
 Bryophyllum calycinum, 181
 Bückthorn, the Sea, as a tree, 295
 Buddleia Colvillei in Norfolk, 21; *variabilis*, 90, 152, 163, 234
 Bulb farms, English and Dutch, 371; planter, a, 262
 Bulb-growing competition in Dundee, children's, 422
 Bulbous plants, early-flowering, 337; from seed, 232; to grow beneath trees, 356
 Bulbs, 187; and plants, spring-flowering, naturalising, 220, 243; dormant, 270; for forcing, 216; in grass, mistakes in planting, 390; remaining dormant, 231; some greenhouse, 215; spring, again in flower, 278
 Butterflies, flowers for, 55, 76, 96, 109, 114, 140, 179, 207

C.

Cabbage, 170, 272; for spring, 40; Long-foot, 55; Red, 87
 Cabbages, 72; Defiance, 75; of recent introduction, some, 15; sowing, for early spring cutting, 88
 Cactus, the Turk's-cap or Pope's-head, 337; *viviparus*, 108, 266
 Calabash, the, 72
 Caladium, 253
 Calanthes, the, 321
Calceolaria amplexicaulis, 147
Calceolaria, 16, 102, 170, 258; bedding, 226; *herbacea*, 204; h. from Scotland, 21
 California in 1903, 408
 Calochorti, group of, in bloom, 113
Calla elliptica and varieties, 156
Callistemon salignus, 281
 Calochortus, culture of, the, 397
Calyx pubescens flore-pleno, 233
 Cambridge Botanic Garden Syndicate, 22
 Camellia as an open-air shrub, the, 440
 Camellias, 343
Campanula alpina, 114; Hendersonii, 196; *peregrina*, 62; *pyramidalis*, 156, 258; p. from self-sown seed, 96; *rhomboidalis* in the rock garden, 249; *Vidalii*, 105
 Candle Trees, 56
 Candytuft, 156
 Candytufts, the carmine, 2
 Cannas, 301
 Canterbury Bells, 137; and Thyme, 119
Cantua dependens, 234; from the Isle of Wight, 163
 Capicum a herried plant? Is the, 371
 Carbolic acid as an insecticide, 276
Cardamine rotundifolia, 23
 Cardoons, 156
 Carnation and Picotee, the florist, 416
 Carnation, a new, Mrs. Lora Armstrong, 231; a new, Sunset, 181; a purple-flowered, 181; as a market flower, the, 24; border, Countess of Paris, 39; Grenadin, 62; *Malmison*, a new, 82, 339; *Marquette*, 62; *Miss Aubrey Campbell*, 291; Mrs. L. Armstrong, 194; new apricot-coloured, 43; seedling, a beautiful yellow—Ceres, 328; *Souvenir de la Malmison*, 112; the old *Coulee*, 62
 Carnations, 64, 170, 288; at Far Forest Vicarage, 147; border, 31, 151, 155; from seed, 180

Carnations in July, seedling, 91; *Malmison*, 15, 155, 206, 254; *Malmison*, the u. *cleane* of, 154, 189, 224; old beds of, for cut flower, 199; perpetual flowering, 324; seedling, 54; some beautiful, 89; Tree, 64, 112, 118, 228, 282; T., autumn propagation, 374; winter-blooming, 273; winter-flowering, 418
 Carrot, a new, Veitch's Intermediate, 313
 Carrots, 80, 238; young, in autumn and winter, 352
 Carter and Co.'s, Messrs. James, Mortlake trial grounds, 154
 Caryopteris *Mistacanthus*, 328
 Cashew, the, 47
Cassia corymbosa, 195; in Ireland, 311
 Castle, Mrs. Lewis, 159
Cattleya amethystiglossa, 273; *bowringiana* *lilacina*, 321; *citrina*, 273; *gigas*, 273; houses, 171; *krameriana*, 99; *labiata* *autumnalis*, 370; Lucy Emery, 99; x *Mme. Bernard*, 99; x Philip Measures, 99; *stylanus*, 408; Warneri *alba*, 47
 Cattleyas, a note on, 273; four new (natural hybrids), 99; new, at The Woodlands, 168
 Cauliflower, a fine, 2; plants, 382
 Cauliflowers, 86, 118, 238; and autumn Broccoli, 257; in pots and frames, 48
Ceanothus divaricatus, 3; Indigo, 234
 Cedar, the, 255
 Celeriac, 238, 353
 Celery, 16, 86, 170, 272, 304; fly, the ravages of the, 372; Standard Bearer, 273
 Celmsia *Monroii*, 414
 Celsia *Arctura*, 64
Cerastium tomentosum, 185
 Chamelirium *carolinianum*, 60
 Chedington Court, Dorset, 120, 242
 Cheiranthus *Allioni*, 332
 Cherry, growing, 26, 42; Late Duke, a valuable late, 157; the, 286, 314; the Winter, 398
 Cherries, 46, 288, 381; early pot, 46; for orchards, 297; garden, 314; in pots, 42; in the orchard, 26
 Chicory, 273, 382
 Chionodoxa, 243
 Chiswick fruit and vegetable show, 12
 Christmas Roses, 382
 Chrysanthemum Belle of Weybridge, 407; Bronze Soleil d'Octobre, 332, 372; decorative, Kitty Crewe, 332; Kitty Bourne, 397; Lady Cranston, 372; Pompon, Anastasio, 230; P., Mme. Ed. Lefort, 230
 Chrysanthemums, 31, 86, 118, 157, 160, 170, 187, 225, 226, 258, 324, 382; as border plants, 395; at Aruncel House, Dumfries, 352; at Exmouth, 384; at Finsbury Park, 372; at Highgate, 391; at Merstham, 325; at Swanley, 342; at The Monkhams, Woodford, 392; at The Warren House, Stanmore, 392; at Waterlow Park, 325; dwarf-trained specimen plants, 86; early, 133, 181; and the weather, 279; at Tamworth, 120; some of the newer, 299; in the Glasgow parks, 408; new varieties, 418; Pompon, 259; Pompon Anemone, and single varieties, 86; preparing for exhibiting, 288; single, 312; some Continental novelties, 371; summer, 137
 Cimicifuga *japonica*, 170
 Cineraria, a yellow, 3; stellata, 344; a. in the flower garden, 322
 Cinerarias, 16, 64, 137
Cistus laurifolius at Kew, 234

THE GARDEN

No. 1650.—VOL. LXIV.]

[JULY 4, 1903.]

THE NATIONAL ROSE SOCIETY'S SHOW.

THE unexpected has happened, and the metropolitan show of this society proved a success. We have no financial considerations in mind, but a few days ago, when the wintry, sunless, and rainy weather upset all calculations, the honorary secretary, Mr. Mawley, thought the outlook dismal, as well he might, but the past few days of brilliant sunshine helped matters to such an extent that absolute failure has been avoided.

It would be idle to describe the show as faultless; but it was an excellent one, taking all things into account, and all we hope is that the society will have earned sufficient to make good the losses of last year, when the weather also proved unkind and the illness of His Majesty the King cast a shadow over every form of entertainment. After all, the Rose shows of this society are forms of entertainment, and without a good "gate" its resources are quickly exhausted.

Those who visited the exhibition in the Holland Park Gardens and advocate a two days' Rose show will surely now be convinced that such a display would be a fiasco. It would be unfair to the general public and intensely uninteresting to the keen rosarian to attempt to continue after the first day an exhibition of a flower whose great charm is beauty of colouring and freshness. We left the tents in the early afternoon, and then even the prize flowers of great substance were collapsing through the heat. We hope, therefore, we have heard the last of this wild scheme.

The sudden collapse of the flowers may be in part attributed to faulty ventilation of the tents. A pleasant breeze stirred the trees outside, but gave no relief to the sweltering flowers and public under the heated canvas. If the society is to continue even a one-day show and earn the praises of the visitors there must be an atmosphere to live in. We are not thinking of this society in particular, but of all societies. It is the same everywhere.

The flowers throughout were small, and in several classes there was no competition whatever, but the exhibition was thoroughly well worth visiting simply to discover how beautiful many varieties were, in spite of the deplorable weather vicissitudes of the past few weeks. It was interesting to see that the old favourite Hybrid Perpetual (Mrs. John Laing) won the first prize for the premier bloom in both the

amateurs' and nurserymen's divisions, in the first case by Mr. E. B. Lindsell, who won the champion challenge trophy; and in the latter by Messrs. Prior and Son of Colchester. Another superb flower was Beattie Brown, which was the premier bloom in the nurserymen's classes, and also shown by Messrs. Prior.

The competition in the great class for seventy-two flowers, distinct, was hotly contested, Messrs. Harkness and Co., Hitchin, Herts, beating Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, by one or two points only. The flowers in both instances were superb for finish, colour, and freshness.

Mr. Orpen's exhibits were of much interest throughout. His bunches of five distinct varieties comprised Lady Curzon, raised, we believe, by Mr. Charles Turner of Slough, it is a Damask Rose, and very soft blush in colour; the Himalayan Briar, wickuriana Gardenia, Leuchstern, and Purity.

The arches of Roses would have been more attractive if wood had been substituted for galvanised wire, but this is a small matter. The baskets, vases, table decorations, and miscellaneous exhibits much relieved the monotony of green painted boxes.

Of new Roses those staged for awards were the pretty Blush Rambler, which we have described before, and a gloriously showy single Hybrid Perpetual pillar Rose, a seedling named The Maharajah, both from Messrs. B. R. Cant and Sons. The flower is over 6 inches across, intense velvety crimson, and reminds one of Bardou Job. Mr. Orpen showed a pretty rose-pink single pillar Rose named Mrs. Orpen, which we shall hear more of.

The Hybrid Tea class once again showed its strength under exceptional circumstances. The flowers of many of the best known varieties were in some instances of superb texture and colour.

We congratulate Mr. Mawley and all his co-workers upon the success of the show under most trying conditions, and we hope the funds of the society will be placed upon a satisfactory footing this year. The weather was glorious, and the tents at times uncomfortably crowded. It is only fair to mention that the officials of the Royal Horticultural Society, Mr. Wright and others assisted the honorary secretary in his arduous labours.

With regard to the often-discussed question of the improvement of Rose shows, Mr. Mawley and the committee have gradually made many alterations for the better. There were Roses in vases, in baskets, bowls, and on

arches. The National Rose Society deserves the support of all Rose lovers and growers in the kingdom. Thanks are due to the Benchers of the Inner Temple for their kindness in placing their pleasant gardens at the disposal of the society.

If the present exhibition proves to be a financial failure, we say again, as we said last year, that two exhibitions in the Temple Gardens within a few weeks of each other, and a Rose show at Holland Park six days before that of the National Rose Society form rather too liberal a diet for even our British flower-loving public.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

At least once a year we have occasion to bring the claims of this institution before those who are interested in the gardening charities. This occasion is the annual dinner, which took place at the Hotel Metropole on Wednesday in last week. We briefly alluded to it in our last issue at the moment of going to press, when we mentioned that the sum collected was £1,750. The chair was taken by the Earl of Warwick, who was supported by Lord Redesdale, Lord Brooke, Sir Walter Smythe, Bart., Baron Schroder, and Messrs. H. J. Veitch, M. H. Sutton, A. Sutton, G. A. Dickson, Arnold Moss, H. S. Rivers, Owen Thomas, W. Crump, J. Douglas, W. J. Nutting, E. T. Cook, G. Monro, Peter Kay, J. Asbee, E. Rochford, G. Sherwood, C. Czarnikow, R. McVitie, G. H. Maycock, W. Mortimer, Herbert Cutbush, Harry Williams, W. Baker, J. Baker, W. Icton, R. Whitpaine Nutting, A. Mackellar, G. Norman, N. F. Barnes, W. P. Barr, Peter Barr, Alderman Piper, J. Laing, and many others.

In proposing the usual loyal toasts, the chairman mentioned that the Prince of Wales, president of the institution, would probably take the chair in the near future, and in well-chosen remarks alluded to the sympathy always shown towards this institution by the Royal Family.

Speaking of the claims of the institution upon the charitable, the Earl mentioned that 204 men and 38 widows were in receipt of pensions; each of the former receive £20 and the latter £16 a year.

Mr. H. J. Veitch, the treasurer, in responding to this toast, urged upon those present to do their utmost for the institution, and referred to the work of the committee, which was thoroughly and economically carried out. Between £4,000 and £5,000 were needful annually to maintain the work which they had in hand. Mr. Veitch also alluded to the kindness of the Earl of Ilchester in allowing his gardens to be opened on the occasion of the Holland Park show on payment of 1s., the

proceeds to go to this institution and the Royal Gardeners' Orphan Fund.

Lord Redesdale in a happy speech gave the toast of "Success to Horticulture," responded to by Alderman R. Piper of Worthing.

After a few other toasts, one to the secretary, Mr. Ingram, the proceedings closed.

The tables were beautifully decorated, thanks to several nurserymen, and in many ways we could see how much the nurserymen and some of the leading gardeners of these isles have the welfare of this charity at heart. We wish it still greater success in the future. It is not an institution in which a large share of the subscriptions are devoted to office or working expenses, but is worked upon thoroughly economical lines. It is the means of bringing comfort to many homes, and we hope that next year even a larger sum will be collected. The following were some of the principal donations: H.R.H. the Prince of Wales, £20; the Earl of Warwick, £25; Lord Redesdale, £5; Baron Schroder, £100; Messrs. Rothschild and Sons, £105; Mr. A. W. Sutton, V.M.H., £50, and £20 to the Good Samaritan Fund; Mr. Martin H. Foquet Sutton, £50; Messrs. Veitch and Son, Limited (annual), £52 10s.; Mr. N. N. Sherwood, £50; Mr. W. Mackay, Exeter, £25; Mr. Leopold Salomons, £21; Mr. R. Dean, V.M.H., £31 10s.; Messrs. Dickson of Chester, £20; Mr. H. J. Veitch, £10 10s.; Mrs. H. J. Veitch, £5 5s.; Proprietors of *Country Life*, £10 10s.; of *THE GARDEN*, £5 5s.; Thames Bank Iron Company, £10 10s.; Mrs. J. Baker, £10 10s.; Mr. George Norman, V.M.H., £21; Mr. A. MacKellar, £17 17s.; Mr. D. Fleming, £20; Mr. George Profit, £23 10s.; Mr. R. Milligan Hogg, £20; Mr. W. H. Massie of Edinburgh, £12 12s.; Messrs. Barr and Sons, Messrs. W. Paul and Sons, Mr. W. Thompson Stone, Mr. James Hudson, and Mr. C. Czarnikow, 10 guineas each; Mr. George Monro and Covent Garden friends, £85; Mr. H. Williams, £8 18s.; Messrs. J. Douglas and J. Jaques, £8 8s.; Mr. E. T. Cook, £7 7s.; Mr. Owen Thomas, £6; and the following subscribed five guineas each: Messrs. R. J. Cuthbert, W. J. Nutting, W. L. Cory, A. B. Wadda, Robert Sydenham, N. F. Barnes, H. G. Cove, Bunyard and Co., G. H. Maycock, Edward Sherwood, William Sherwood, Cutbush and Son, H. J. Adams, George J. Braithridge, R. McVitie, and James Lee.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

JULY 7.—Wolverhampton Floral Fête. This is held in the West Park, and will continue for three days.

July 7.—Royal Horticultural Society's meeting; Southampton Horticultural Show; Harrow Show.

July 8.—East Anglian Horticultural Club meeting; Farningham and Croydon Shows.

July 9.—Woodbridge Show.

Royal Horticultural Society.—The next fruit and flower show of the above society will be held on Tuesday next in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. Lectures on "Hardy Irises" will be given by Miss Armitage and Mr. Caparne at three o'clock. At a general meeting of the society held on Tuesday, the 9th ult., 132 new Fellows were elected, amongst them being the Earl of Munster, the Countess of Lucan, Sir Algernon West, K.C.B., Sir William Eden, Bart., Lady Liddell, Lady Meyrick, and Lady Young, making a total of 900 elected since the beginning of the present year.

Hybrid Richardia.—In your issue for June 20, page 419, we note mention being made of

a new hybrid Richardia, raised by Mr. Latham, Botanic Gardens, Birmingham, by crossing Richardia albo-maculata with R. eliottiana, the result being sulphur-yellow spathe with crimson blotch on the base inside, the leaves also being spotted with white. It will no doubt interest you to hear that some few years ago we crossed R. eliottiana with an old type now rarely seen, viz., R. aurata. This resulted in a hybrid that would apparently be a counterpart of the one produced by Mr. Latham, as our hybrid also possesses the rich sulphur-yellow spathe and the crimson blotch at the base of the inside. The leaves also have those transparent blotches that are characteristic of R. eliottiana. We have also a recollection of a similar one of Continental origin receiving an award at the recent Temple show. We would mention that we put our hybrid into commerce some few years ago under the name of Richardia Taylori.—CLIBRAN AND SON, *Altrincham*.

Pigmy trees and hardy flowers at the Botanic Gardens.—Messrs. Barr and Sons, King Street, Covent Garden, are holding an exhibition of hardy flowers and Japanese pigmy trees in the above gardens, Regent's Park. The exhibition will remain open until July 11. Entering the corridor from the large conservatory one first sees the hardy flowers, which extend about halfway down. English, Japanese, Spanish, and Flag Irises, Poppies, Peonies, Delphiniums, Water Lilies, Gladioli, Calochorti, Lilliums, Pyrethrums, and Sweet Peas are all well represented, and combine to make a brilliant display of colour. Among the English Irises are some lovely varieties—for instance, Rebecca, blush, splashed with crimson; Blue Celeste, rich blue; Clara Butt, French grey; Blanche Fleur, white, except for a few yellow markings; Bacchus, rich purple; Triumph, China blue; and Lord Roberts, deep blue. Gladiolus Peach Blossom is a beautiful flower of the richest pink; Iris aurea has large, rich yellow blooms.

Hardy flowers at the York show. In the exhibit from Mr. J. Wood, Kirkstall, Leeds, at the York Gala the following plants were worthy of particular mention: Allium oestrowskyanum, Adiantum pedatum, Androsace lanuginosa, A. l. oculata, Arisema triphylla, Astragalus hypoglottis albus, Campanula divergens, C. oensis, Dianthus Atkinsonii, D. neglectus, D. Sternbergii, and Edraianthus serpyllifolius.

Delphinium Belladonna from seed.—Is not "M. L. W." in error in writing of "seedlings" of this fine old plant? I grew it largely for many years, but never saw a seed, and am under the impression it is sterile. The other difficulty, Lithospermum prostratum, flourished at Chilwell on a thin loam over gravel without any manure or other addition, in the full sun, but on the level. The plants filled a small bed, forming a matted carpet, which was a beautiful sight each spring for many years.—CHARLES E. PEARSON, *Loudham*.

Sir Daniel Morris, K.C.M.G.—His Majesty the King's Birthday Honours List contains the name of Daniel Morris, Esq., C.M.G., D.Sc., M.A., upon whom has been conferred the dignity of a Knight Commandership of the Order of St. Michael and St. George. Sir Daniel Morris, who was formerly assistant director of the Royal Botanic Gardens, Kew, left there in 1898 upon his appointment as Commissioner, Imperial Department of Agriculture, Barbadoes, West Indies. He was at one time treasurer of the Royal Horticultural Society.

Oehna multiflora not a stove shrub. Mention has been made several times lately of the pretty greenhouse shrub, Oehna multiflora, and as I see it is described as a stove shrub, I do not wonder at its being little known or grown, as it will dwindle and die in such a temperature. Coming from rather high altitudes, it needs a winter temperature of 50°, with plenty of air, and will then thrive and make a healthy plant. Its bright yellow flowers in February are quickly over, but the fleshy calyx soon swells and becomes bright red, while the seeds turn gradually from green to black, when it is most attractive. It is best raised from seed from time to time, as it is apt to seed itself to death. I have, however,

sometimes kept a good plant for ten years, but the finest specimens are made by preventing it bearing seed till it has attained a fair size. Like the Heaths, it requires a peaty soil and plenty of air at all times, and should be in the coolest house all summer if a healthy plant is desired.—EDWARD H. WOODALL.

An imperishable horticultural paint.—Mr. Chas. T. Druery as manager of the Lubroce Paint Company, Moorgate Station Chambers, E.C., calls our attention to a paint recently introduced into this country, which is admirably adapted for the protection of wood and ironwork in conservatories or greenhouses. It is entirely distinct from oil paints, having an imperishable rubber-like body as a basis, so that the paints form an elastic and strongly adherent skin which cannot crack, blister, or flake off, and stands both heat and damp indefinitely. As no priming is required, and two coats equal in covering capacity four of oil paints, they are very economical in application, apart from greater permanence, while their appearance is equal to the best expensive enamel paints. An enormous Continental consumption and an experience of five years demonstrates their value beyond a doubt.

Azara microphylla.—This is a graceful evergreen shrub, highly ornamental, producing Palm-like branches, the leaves disposed in pairs on the branches. It produces greenish yellow flowers in clusters in summer, followed by numerous small orange-coloured berries. It is hardy enough to stand out in the open without injury if a little elevated in a sheltered position. It makes an excellent wall shrub, in which position it is probably seen to the best advantage.

The carmine Candytuft.—The dawn of this group of Candytufts was, no doubt, when MM. Vilmorin and Co. of Paris introduced their large flesh-coloured annual variety, which they distributed many years ago, and which proved a most valuable addition to our annual Candytufts. By means of successive selections what is known as the cardinal was developed, and this has proved such an advance in colour as to justify being described as carmine. I found the deep-coloured form true last year, but it is always wise for garden as for commercial purposes to select as seed-bearers the deepest coloured and finest formed flowers. The carmine Candytuft now needs to be led on in the same way until a variety is produced from it as large as the carmine. We have a very fine giant white in Dobbie's Giant Spiral. This produces long spiral spikes of large white blossoms. In its true form it is of compact growth, as well as highly floriferous, and it is entitled to take a place among the very finest and most useful of our hardy annuals.

A fine Cauliflower.—This is a Boston selection, and is known as Johnson's Market Garden Autumn Cauliflower. It illustrates the value of careful selection. A plant was seen to show greater precocity than its fellows; seeds were carefully saved and sown; the large majority of the plants were found to show the same precocity; the most perfect of these were selected as seed-producers; and in this way the precocious character was fixed. This process illustrates the care taken by our seed growers to have stocks with the greatest fidelity to type, combined with the highest quality.—R. D.

Hampstead Heath view.—The council for the Hampstead Heath extension scheme have resolved to make an effort to raise £48,000 for the acquisition of eighty acres of land, offered by the trustees at £600 per acre, on the north-west boundary of the heath. It is sought to save Wyld's farm and the neighbouring meadows from the builder, thereby retaining the view from the Spaniards Road and the north-west heath, providing new playing fields for Londoners, and avoiding the congestion which might arise from the increased traffic by the "tube" railway. Mr. G. J. Shaw-Lefevre is president and the Earl of Meath vice-president of the council. The provisional committee has raised £3,000 in two weeks.

Devizes Chrysanthemum show.—The date of the above show is altered from November 11 to November 3.

Feltham, Bedfont, and Hanworth show takes place on the 22nd inst. at Feltham.

A yellow Cineraria.—The *Cineraria* referred to on page 403 as *Cineraria auriculata* is a native of British Central Africa, from where it was introduced about half a dozen years ago. The specific name is derived, not, as suggested, from the colour of the blossoms, for the term *auriculata* signifies having ear-like appendages. Considering that the genus *Cineraria* is now entirely swept away by botanists, being completely swallowed up by *Senecio*, it would appear that though the garden varieties do not include any yellow forms they have more relatives of that colour than any other. Like *Azaleas*, *Gloxinias*, *Cerasus*, *Amaryllis*, and many other classes, it is more than probable that the botanists dictum will never be generally followed in gardens, at least in our days.

Rubus moluccanus.—This member of the Bramble family, so well illustrated in THE GARDEN, page 408, is the plant which, under the name of *Rubus reflexus*, attracted much attention at the recent exhibition at Ghent, being unknown to at least most of the English visitors. In good examples the leaves reminded one much of some of the *Begonias*. As it is readily struck from cuttings, we shall doubtless soon see this *Rubus* plentifully distributed in gardens. This Bramble furnishes one among many instances of an old plant bounding all at once into a popularity it has never before attained, for *R. moluccanus* was introduced as long ago as 1817, yet it has been one of the most talked of subjects during the last few weeks.—H. P.

Ceanothus divaricatus.—This *Ceanothus*, mentioned in THE GARDEN among the shrubs in flower at Kew, struck me during a recent visit as one of the most notable features there, and one that as a shrub in the open ground (apart from the protection of a wall) is rarely seen in such grand condition. It attains the dimensions of a large bush some 10 feet to 12 feet high, and is of a dense, freely-branching habit of growth. The oblong ovate leaves, an inch or so in length, are dark green, while the flowers, which are borne in dense clusters, are of a very distinct shade of pale slate blue. So numerous are they that when at their best the entire plant appears to be a mass of that tint. This *Ceanothus* is, like most members of the genus, a native of California, and was first introduced by seeds sent to the Royal Horticultural Society in 1841, a period when through its agency many new plants were introduced. Judging by its behaviour at Kew, this must be regarded as one of the hardier forms of *Ceanothus*, though in many districts the protection of a wall would no doubt be best.—T.

Rhododendrons in Hyde Park.—Year by year Mr. Anthony Waterer, of the Knap Hill Nurseries, Woking, makes a great display of these beautiful flowering shrubs in Hyde Park. The best sorts noted on a recent visit were:—White and other shades: *Sapho*, white, distinctly blotched with maroon; *Helen Waterer*, centre white, edged with crimson; *Duchess of Connaught*, white, yellow spots, very showy; *album elegans*, blush, changing to white, fine shape; *The Queen*, the description of the previous variety exactly applies to this sort; *Princess Mary of Cambridge*, light blush, deeper edging; *Lady Grey Egerton*, silvery blush, splendid truss and foliage. Purple: *Purpureum elegans*, a very fine flower in this particular shade of colour. Crimson and scarlet: *Michael Waterer*, crimson, spotted, fine; *John Waterer*, free-blooming, dark crimson; *H. W. Sargent*, crimson, enormous truss; *barclayanum*, deep rosy crimson; *J. Marshall Brooks*, rich scarlet, with a bronze spot, a striking flower; *Martin Hope Sutton*, scarlet, richly marked, distinct and very fine. Pink and rose, &c.: *Mrs. Mendel*, pink, each petal rayed white, yellow centre; *Concessum*, clear pink, light centre, beautiful; *Kate Waterer*, rose, yellow centre, very

showy; *Mrs. R. S. Holford*, rich salmon truss, large and beautiful; *Lady Eleanor Cathcart*, pale rose, spotted chocolate; *Stella*, pale rose, with an intense chocolate blotch; *Mrs. W. Agnew*, pale rose, yellow centre; *roseum elegans*, an old and general favourite; *Marchioness of Lansdowne*, pale rose, with an intense black spot, one of the most distinct varieties; *Mrs. John Penn*, salmon-pink; *W. E. Gladstone*, pink, fine truss; *Mrs. Arthur Hunnewell*, pink, primrose centre, very pleasing. Lilac: *Everestianum*, rosy lilac, spotted and fringed, an excellent free-blooming sort; *Mrs. Harry Ingersoll*, deep rosy lilac, greenish centre. Mauve: *Pastucum flore-pleno*, a flower of this colour bearing immense trusses of double flowers.—Qvo.

Aubrietias.—I have seen a Fire King growing at Long Ditton Nursery in previous years, and thought it the most richly coloured of all the Aubrietias. The habit then was excellent with respect to seedlings. Not all varieties produce seed freely. The very best for that purpose was a

lasting Pea for decorative purposes. Not only are the flowers much larger than those of the ordinary type, but a spray can be cut with a dozen and more expanded blossoms on a stem. It is possible to grow this Pea in pots under glass for early blooming, and in the open for a later supply, thus securing two successive cuttings. Fine as this Pea is in the open, it is magnificent under glass.

Osmanthus ilicifolius purpureus. Some bushes of this evergreen shrub are just now objects of interest and beauty in the Chiswick Gardens of the Royal Horticultural Society, and they mingle their coppery red tints with the vernal green of other evergreen shrubs in a most attractive manner. It is scarcely to be wondered at that it is sometimes mistaken for a Holly.—R. D.

Messrs. Dobbie and Co. write: "We have just purchased 60 acres of fine freehold land in the Essex seed-growing district. It lies alongside the main Great Eastern line, and is close to

TUFTED PANSIES IN A ROCK GARDEN.

(Note the dwarf tufted growth of the plants and the profusion of flowers.)

rich reddish violet-coloured variety I found in a batch of seedlings from Henderson, which was put into commerce as *A. violacea*, and none other ever equalled it in seed production. When seedlings were raised the majority would be of the hue of colour of the parent; some would be lighter, but hardly ever was one better. Still, as to colour and form, as well as in floriferousness, the effect of masses was very striking. I had to grow it largely for seed production on level and rather retentive soil, and the winter frosts would often nearly kill the shoots, but soon it would break up and then become literal masses of bloom 15 inches to 18 inches across. Dr. Mules very much resembles what *A. violacea* was fifteen years ago, and for all I know may be now. To do Aubrietias justice they should be planted to run over stone or rock work, as they rejoice in such positions, and in time become cascades of growth and colour.—A. D.

Lathyrus latifolius grandiflorus albus.—What a fine grower this Everlasting Pea is, and what a superb plant for cutting from! A white Everlasting Pea such as the above, which was recently distributed by Hobbies and Co. (John Green), Norfolk Nurseries, Dereham, comes as a great boon to those who use the white Ever-

Marks Tey Station. We intend removing our seed-growing operations from Orpington to this new place next season."

TUFTED PANSIES (VIOLAS) AS ROCK PLANTS.

THE Tufted Pansies as plants for the rock garden are not so well known as they deserve to be. Among the many plants that are freely used in the rock garden, the Tufted Pansy is one of the best. They make a long-continued display, often flowering from March till October, and even later in some seasons. Modern raisers have fortunately given us a race of plants of better growth in every way than the older sorts for the rock garden; it is more compact. Tufted accurately describes the habit of the more modern sorts, and as the tufts are studded with charming blossoms, in most instances free from the rays, which are always associated with the older types, a keener appreciation of the rayless flowers naturally follows.

The rayless Tufted Pansies are more refined than the rayed forms. The colour, too, is much better represented, many pleasing intermediate shades now being obtainable.

It is with plants of this description that so many charming effects can be created, the work being simplified by the wealth of sorts now within the reach of all. No grower has done so much within recent years to popularise the Tufted Pansies as Mr. William Sydenham, Tamworth, Staffordshire. His Pansy gardens are always an interesting sight when they are in flower. The illustration shows the free flowering character of the plants when grown in the rock garden. As may be seen ample space is given for the full development of each plant, the pieces of rock being arranged in such a way that a cool root run is afforded, and plenty of soil also. These are two points which the grower must always recognise if his efforts in planting a rock garden are to end successfully.

Mr. Sydenham has raised many new Tufted Pansies, and he is always on the look out in his beds of seedlings for those adapted for special purposes. The Violettas, or miniature-flowered varieties, are specially adapted for the rock garden, and in addition to those raised by the late Dr. Stuart and others, Mr. Sydenham has a small and interesting collection of his own. A variety named Pigmy is a pretty little blue flower with a yellow eye and rayless, possessing a beautiful habit, and flowering profusely for many months. Robin is a rather small flower of a blush colour, each plant being literally covered with a mass of blossoms, in this instance with short flower-stems. Walter B. Child is a very dainty flower with a white rayless centre broadly margined with a lavender colour. The plant has a good habit, and is also very free flowering. Quail is a slight improvement on the last named, and there is room for both sorts. Minnie Warren is a charming blush-lilac miniature of beautiful form, and on long flower-stalks. The plants in this instance are very small, and rather later in flowering than the others, but it is extremely pretty. Forget-me-not and Diadem are two new sorts, somewhat in the way of W. B. Child, but worthy of inclusion in this selection. Violetta, the original of the type, is invaluable; it is a rayless white, suffused with yellow in the centre and very sweet scented.

The foregoing are a few of the miniature flowered sorts suitable for the rock garden, but many of the larger-flowered Pansies are suitable for this purpose.

D. B. CRANE.

BOOKS.

Hand List of Coniferae.*—The first edition of the "Hand List of Coniferae" grown in the Kew Arboretum has been exhausted for some time. It is now republished after having been carefully revised and enlarged by the addition of names of numerous species and varieties which have been added to the collection since the first edition was prepared. For the revision Sir W. T. Thiselton-Dyer is indebted to Dr. Masters, F.R.S. The coniferous plants now enumerated include 246 species and 451 varieties, or some 700 "sorts" in all. In the first edition it was stated (page 16) that *Ginkgo biloba* is apparently nowhere known in the wild state. Several fine specimens have since been found by Mrs. Bishop in the magnificent forests which surround the sources of the Great Gold River and the smaller Min, in Western China, and also in the forests of Central Yesso, Japan. Measurements of several exceptional specimen trees made by Mr. Bean in the Royal Gardens are given, and no less than ten exceed the dimensions recorded in the report of the Royal Horticultural Society's Conifer Conference in 1892.

Sweet Violets and Pansies and Violets from Mountain and Plain.† This is the latest addition to the *Country Life* Library, and after a careful perusal of its contents must be acknowledged a distinct acquisition to horticultural literature. The book should meet

the doubts and difficulties as well as the needs of those who have an interest in these charming flowers, and as the subjects treated have never been so well considered before, this new volume deserves to be widely read.

As the title of the book denotes, the genus *Viola* is dealt with in a most comprehensive manner. The editor in the preface is careful to explain that "it is not the work of an individual, but is the outcome of information willingly given by those mentioned . . . and of the many articles that have appeared in *THE GARDEN* during the past few years." Kindly reference in the preface to those who have accomplished praiseworthy work in the past with the show and fancy Pansies is made, several of the early workers being mentioned by name. The great work of Dr. Charles Stuart, of Chirnside, is recalled, and a well-earned tribute paid to his unceasing labours to gain new and beautiful forms of the Tufted Pansy. Much of the present popularity of the latter type of the flower the editor rightly attributes to the encouragement given to its culture by Mr. William Robinson. Other enthusiastic raisers and cultivators are also mentioned. Violets of mountain and plain are very fully dealt with, each of the species being described in detail. A most welcome feature is the chapter devoted to Sweet Violets, this contributing much useful information, of which too little hitherto has been heard.

The garden Pansy is the opening chapter, and in it is traced the evolution of the flower. The reader is taken back by Mr. R. Dean to 1813-14 when Lord Gambier and his gardener, Thompson, began experiments with *Viola tricolor* of the fields. The results of their numerous experiments are given in considerable detail, and show how much time was spent in the early days in trying to improve these flowers. Subsequently, about forty years ago, Mr. John Fleming created a sensation at Cliveden, Maidenhead, by his huge beds of Pansies. He will be remembered as the raiser of the Cliveden set. We can fully endorse the remark that the "show Pansy was regarded as one of the most interesting of 'florists' flowers from the forties until the early eighties," but take exception to the expression that they "are seen also at the present day." The show Pansy is never seen out of Scotland, except, perhaps, in those counties immediately south of the Border. The characteristics and properties of the show Pansies are clearly defined and a selection of the best sorts given. Methods of culture and the question of insect pests and their eradication receive due attention.

The fancy Pansy receives a larger share of attention, as its more showy and interesting character well merits. In speaking of the fancy Pansies of English production, the contributor says: "They are so refined and so distinct from the fancy type; they are generally of vigorous growth and remarkably free blooming, so that it is not to be wondered at that they should be rising in popular favour, though the large, gorgeously blotched fancy varieties still dominate the gardens. As they are not restricted as to character by a schedule of arbitrary properties which govern the English show varieties, anything which can lay claim to form, size, stoutness of texture, and brilliancy of marking can be comprehended in the fancy section." Those who prize the Pansies for their value in the garden have every reason, therefore, to be pleased that the fancy Pansies "are not restricted by a schedule of arbitrary properties." A brief history of this type of the flower with a useful selection of varieties is given, as also are the properties of the fancy Pansy by Mr. Alexander Lister. Notes on raising seedling Pansies, and propagation by cuttings and also by division, give useful and practical cultural information.

"Pansies at shows in paper collars" has a short chapter to itself. We are quite in sympathy with the opening remarks, which read as follows: "Pansy shows are not the terrifying spectacles of a former age, although there is something to be said for the old school florist, who loved regularity of form and flower marking, but the petals in their paper collars were grotesque. Such exhibitions conveyed one lesson—'how not to show Pansies.'"

Chapter IV. deals exclusively with the tufted Pansy, which the heading explains is commonly called *Viola*. No less than thirty pages are needed to treat fully so beautiful a plant for our gardens. The proper definition of Tufted Pansy is clearly laid down, and this should assist materially in securing for this type of the flower a proper English name. Their propagation is carefully explained, several excellent illustrations of good, bad, and indifferent cuttings, &c., being given. Propagation for both spring and autumn planting, methods of making cuttings and cutting-beds, and many other details, each of value in its season, shows how thoroughly practical the advice is. We are glad to see that "coddling" the plants is not advocated, and can heartily support the fact that "Pansies, however, it must ever be remembered, are quite hardy, and therefore need no protection." Raising seedlings, as the writer remarks, is a "fascinating pursuit," and one never knows what a batch of seedlings may produce. This aspect of culture is worthy of more attention, and if the best results are to be obtained and one has no seed of one's own saving it is "of first importance to purchase seed collected from the finest varieties," which only a specialist can supply.

"An appreciation of the Tufted Pansy" is pleasant reading, and gives a good idea of what can be done with these plants. Pansies as cut flowers in summer, in rock and wall, in town and suburban gardens, and treatment of Pansies received by post, show the scope of this book. Selections of rayless and rayed varieties, the charming miniature flowered sorts, and a list of some of the best margined and fancy Tufted Pansies add considerably to its value.

Chapter V. is somewhat unique in that it deals with "Violets from Mountain and Plain," an aspect from which little is said and much less is known of the genus *Viola*. Most interesting information is forthcoming under this heading, and might well be taken to heart by enthusiastic gardeners who desire to achieve improvement. On page 58 we read: "It must be admitted that the Violets in general are either unknown or unheeded, and the hybridist seems to ignore the great possibilities of creating a new race, by crossing one or more of the species from the mountains of Europe. . . The material is here for some zealous worker to take in hand and give to the gardens of generations to come floral joy and comfort, more so even than from those who have worked diligently in the past." This chapter must be considered a valuable contribution.

The chapter on "Sweet Violets" is a most welcome feature in this interesting book. The subject is well treated, and cannot fail to impress readers with its practical value. "Violets in the Garden," "Soil," "Position of Beds," "Raising Young Plants," "Varieties for the Open," "Double Violets in Frames," "The Start," "Summer Management," "Violets during Winter," and "Selections of Double and Single Violets," are some of the sub-headings.

A useful little index is given at the end of the book, and the illustrations are plentiful for a work of this kind. The book is well got up, and the type is good and clear.—C. A. H.

ROSE EXHIBITING FOR BEGINNERS.

In this article I shall endeavour to give the beginner a few hints on exhibiting Roses. One of the first things he should study is the form of a good flower. Should he belong to the National Rose Society he will find that in their catalogue three excellent examples are given of what a good Rose should be. If he visits a Rose show and makes a close survey of the premier boxes he will find that it is not always the biggest Roses that have obtained honours, form and freshness of colour coming first; size afterwards. On receipt of the schedule of the exhibition he proposes to enter for, he will, as a rule, find classes in it to suit both the big and little man.

* "Hand List of Coniferae" grown in the Royal Botanic Gardens, Kew. Sold at the gardens. Price 3d.

† "Sweet Violets and Pansies and Violets from Mountain and Plain." Written by several authorities, and edited by E. T. Cook. Published by George Newnes, Southampton Street, Strand, and at the office of *Country Life*.

The thing for him to do is to go in for the lowest class and gradually work upwards as success comes. We are all apt to think our Roses are prize ones at home, but when put against others we have sometimes to alter our opinion. There is quite as much honour in a little man winning in a class for six as the big man in a class for twenty-four. When

CUTTING THE BLOOMS

it is best to do so the evening before between six and eight o'clock. They last longer than when cut on the morning of the exhibition. Do not carry them about on a tray, but have some tins of water in a box and put them in immediately, transferring them to a cool room. Put them in the show box temporarily and leave the lid open a little and defer the final fixing up until the exhibition is reached. Cut with as long a stem as possible, and gently tie the centre of the blooms with double Berlin wool, as this prevents too quick expansion and enables them to travel better. In arranging, always put the largest flowers in the back, the best at the corners, the medium ones in the middle, and the smallest in the bottom rows. If the weather is hot I find a piece or two of ice placed on the moss very beneficial, it helps to preserve the flowers. Take as many spare blooms with you as possible. Arrive at the exhibition early, get the card from the secretary, and place the box in position, leaving the lid about 2 inches open. Then wander round the tent and watch some of the old hands setting up. It is very interesting, and one will learn more from seeing others than from any written directions.

On no account keep opening the box and looking at the flowers. You will probably see a brother exhibitor keep arranging and rearranging his flowers—let him—leave yours alone until about three-quarters of an hour before the time arrives for clearing the tent, then put the box in order, see there are no duplicates, and that the labels are neatly written. With a camel-hair brush gently brush the outer row of petals outward, and loosen the ties a little, but do not remove them until just before the tent is cleared, as some of the thin varieties like Captain Hayward have a very bad habit of bursting at the last moment. Have the spare blooms quite ready to replace if necessary. You will now have to retire to await the judge's decision. You may have the pleasure of seeing your box marked "First Prize," perhaps that honour may be deferred for another occasion. Never mind; make up your mind to try and go one better the following year. It sometimes happens when one has entered for an exhibition that there are very few blooms to draw from owing to the season, and one doubts the wisdom of exhibiting. If it is possible to make up the box, by all means exhibit. Your brother exhibitor's flowers will probably be like your own, and the chances will be the same. One, too, often hears the remark, "What is the good of my exhibiting when I have to compete against the professional gardener." To a very great extent that is a mistake; the gardener has too many other things to think of. He cannot give the attention to his Roses as the man who grows his own, who coddles, feeds, and nurses them himself, who loves them, and gives them the whole of his attention.

Enfield.

CLOTH OF GOLD ROSE.

THIS is not a Rose for outdoors in all parts of the kingdom, but Rose growers, we think, will be interested in the accompanying illustration,

CLOTH OF GOLD ROSE IN BASUTOLAND.

which depicts it growing in Basutoland. The flowers are large and soft yellow in colour. Mr. Crook, writing in *THE GARDEN* of May 6, 1899, says:—

"The bright, shining, smooth foliage and large, soft yellow flowers with deeper centre and sweet scent, place this Rose amongst the best yellow forms. There used to be a fine specimen of it growing on a warm south wall, the roots running under a gravel walk, in the gardens at Farleigh Castle, near Bath, forty years ago. In this position it bloomed abundantly. I am aware it does not bloom satisfactorily in the open except in a few favourable situations, and is not to be recommended for general planting in the open; but for growing in a cool house and trained close to the glass nothing could be more beautiful. It is growing in this way at Cricket St. Thomas, near Chard, in a Camellia house. The plant is an old one, having a stem as thick as a man's arm, the roots in a hard soil. In this position the wood ripens well and flowers very freely every year during March and April. It deserves to be more grown under glass, and is quite as satisfactory as *Maréchal Niel*, all points considered."

ROSES IN ALDENHAM HOUSE GARDENS.

GROUPING ROSES.

THOUGH not a new method, the arranging of suitable Roses in groups in various parts of the ornamental grounds has much to commend it, as when once the sites have been decided upon and the ground well prepared these give very little trouble compared to the effect produced and the wealth of blooms, which may be cut all through the season. The ends of shrubberies or banks form admirable positions to grow them in, choosing, of course, the most sheltered places. Time will be well spent in giving the plants a good start by taking out the old soil to the depth of about 18 inches and adding good turfy loam, road scrapings, and plenty of good farmyard manure, and at the same time see that the beds are properly drained.

Early autumn is the best time for planting. The growths should be well pegged down and they will require little pruning. At the same time give a good mulching of horse manure. The young shoots will also require to be pegged down once or twice during summer, and after the ground is well covered allow them to grow away as naturally as possible. One or two applications of insecticide should be applied to keep them free from insect pests, and during long spells of dry weather give good drenchings of liquid farmyard manure. During winter the more tender Roses can be easily protected, first by heaping some light porous soil over the crown of the plants, and a little light long litter or Bracken placed over the growths will render them safe till spring.

Pruning.—A judicious thinning of the weakest shoots should be done annually, but not too severely. Apply a good dressing of loam and half-decayed farmyard manure, thoroughly peg down, and the work is finished till the young shoots require attention as before mentioned. Choose as much as possible varieties which do well on their own roots, as when worked on other stocks the suckers often give much trouble, and unless carefully watched for and removed do much damage to the plants. I append a list of some of the varieties which do best here, and are particularly well suited for this purpose:—

Bengale Hermosa.—One of the most delightful Roses I know for this purpose. It is so cheap that it is within the reach of all, perfectly hardy, does well in any position, and continues to flower in great profusion from early spring till quite late in autumn. I have in mild seasons seen good blooms on our beds at Christmas, and it is also sweetly scented. This variety is suitable either for the trimmer parts of the garden or for the semi-wild portion, such as the wilderness or woodland walks, where ground game does not abound.

R. Cramoisie Supérieure.—An old favourite of much merit, and only seen at its best when planted in good-sized groups. It is among the brightest of anything I know, and can be seen from a great distance, the foliage being

particularly attractive. It is not a very strong grower, and therefore should be planted rather thickly. It is very free, continues to bloom through the season, and makes an admirable group in a shrubby bed.

R. alpina pyrenaica.—This is very little known or grown, though a fairly good grower with us. The flowers are small and not of much value, but the foliage assumes lovely tints in autumn unsurpassed by those of any other variety I know, and the bright red spines and wood during winter are very telling. Should be in every collection.

R. rubrifolia.—Much grown on the Continent for forming hedges, for which it is admirably suited. It is very robust, and the beautiful plum-coloured foliage and wood are highly attractive, especially the points of the young shoots in summer, and during winter the wood retains the same distinct colour. We have grouped it in several places and kept the growths pegged down, but not too formally. When treated in this way it makes a distinct and pleasing object; the flowers are insignificant, but the fruit is large and showy. Well suited for any position in the pleasure grounds. The small

Polyantha Rose Perle d'Or is another favourite here, and when well established forms charming groups and produces thousands of its perfect little blooms all through the summer and autumn.

R. Mme. E. Resel.—This Hybrid Tea, though none too hardy, is also admirable for the purpose. The several varieties of

Rosa rugosa are also well adapted for grouping in bold masses. These should not be pegged, but allowed to assume a natural habit, severely pruning them during spring. They should be planted in as large masses as possible in separate colours. The best for this purpose is the semi-double white *Blanche Double de Coubert*. The perfume of the flowers is most refreshing, and the large fruits are also beautiful during autumn. There are many other Roses which lend themselves for such planting equally well, but those enumerated are among the best.

PILLAR ROSES.

Good pillars of Roses are so useful for both small and large gardens that it is not surprising their culture is increasing. Even in quite small gardens, where ground space is of the greatest consideration, they may be grown to perfection without taking up much room, and larger quantities of Roses may be had in this way as compared with other methods of culture. In large places these Roses, when boldly planted, make pictures of colour about the shrubberies not easily forgotten.

But they must be liberally grown. Something more than driving in a long stake and training them to it is required. Stout Larch poles 6 inches to 9 inches in diameter and from 10 feet to 15 feet out of the ground should be fixed in, being well supported by three stout struts to not only strengthen them, but for appearance sake, as these form a kind of base. When well clothed they are very pleasing, and will last many years. The ground should be well prepared by introducing good loam and manure, and the plants well mulched each season. An annual thinning of the growths in early spring will be required, and the growths should be securely nailed to the poles. Free-growing varieties will clothe these in two seasons.

There are now a large number of varieties for making pillars, but the following can be most thoroughly recommended:—*Leuchstern*, rose-pink; *Carmine Pillar*, single, carmine; *The Dawson*, rosy pink; *Setigera*, deep rose

and late; *Paul's Single White*, Pink Roamer, very free, rose-pink; *Sinica Anemone*, single, silvery pink; *Thalia*, white; *Euphrosyne*, pink; *Aglaia*, canary yellow; *Vivid*, crimson; *Una*, creamy white; *The Lyon*, rich crimson; *Felicite Perpetue*, creamy white; *Myrianthes Renoncule*, blush edged rose; *Alister Stella Gray*, yellow; *Multiflora*, white; *Moschata alba*, white tinged pink; *François Foucard*, lemon yellow; *Claire Jacquier*, nankeen yellow; and *Celine Forestier*, sulphur yellow.

THE FLOWER GARDEN.

LILY FAILURES IN 1903.

LAST year was not at all a favourable one for Lilies, and the many lovers of this beautiful class congratulated themselves on the fact that the Lily conference was held in the previous year, when Lilies on the whole did well. The present year is likely to be even more disappointing, for in many districts the early Lilies at least have been comparative failures, and many of the later ones are already showing signs of disease. The sharp spring frosts left their mark on many, particularly on the Japanese *L. Hansonii*, which is one of the easiest of Lilies from that region to establish here; but, unfortunately, it starts into growth so early that the frosts often destroy the flower-buds. Out of a number of this Lily recently noted, which even last year flowered well, and early this spring gave promise of a beautiful display, there was not one single expanded blossom, the buds having all perished. Many other Lilies suffered also, but to a much smaller extent than *L. Hansonii*, though in moist districts *L. Henryi* has a most unhappy look. *Lilium auratum* is a most tantalising species, and failures in its culture far more than outweigh the successes. All attempts to grow this Lily as a remunerative crop, either in this country or in Holland, have failed completely, hence we are still compelled to obtain bulbs from Japan, where disease is certainly far more prevalent than it was a few years ago. The result of this is to be seen in the increased mortality during the voyage, and in the number that never make their appearance above ground after planting. At the Chiswick conference Mr. George Massee read a paper on the different Lily diseases, but he did not touch upon an ailment, fungoid or otherwise, which often plays such havoc with *L. auratum*. This frequently attacks the most vigorous examples, and is first shown by the plant suddenly ceasing to grow, then the top bends over, the buds drop, and soon afterwards the leaves follow. A brown stripe frequently appears on one side of the stem, and from this the leaves are the first to drop. It is generally referred to as sunstroke, but whether this is the direct cause is a matter of opinion. It is certainly, as a rule, most prevalent during showery weather, when hot suns are alternated with heavy rains; but this year the rains without the sunshine seem to have been sufficient. Probably the low temperature of the soil combined with the wet has much to do with the matter. A strange feature of this disease is that the bulbs are not affected, as if dug up directly the stems die down not only the bulb itself, but the roots will, as a rule, be found in good condition. To fight this ailment various devices have been tried, the most effectual being to plant the bulbs among low growing shrubs, so that the basal portion of the stem

from whence the roots are produced is shaded from direct sunshine; but even this is not always successful, though it is undoubtedly helpful.

EVILS OF LATE PLANTING.

Another matter which has a great deal to do with Lily ailments has formed the subject of many notes, yet it is ignored as much as ever. This is the late season at which the bulbs are planted, for if they are kept out of the ground too long not only does the substance of the bulb suffer, but the basal roots, which are the first to form, are few and weak compared with those on bulbs planted earlier, and consequently when the greatest strain comes many of them succumb. At all events, the experience of several years is that the mortality among late-planted bulbs is far greater than among those planted at the proper season. That the climatic conditions of this country do not supply all the requirements of the different Japanese Lilies is shown by *L. odorum*, *L. Krameri*, and *L. rubellum*. None of these ever become thoroughly established, so that it is necessary to keep up the supply by annual importation. True, a few may be sometimes coaxed to flower the second season, but very rarely afterwards. However treated, the bulbs seem to suffer from an excess of moisture, which lodges at the base of the scales and forms the seat of decay. Very frequently a bulb will be to all appearance quite sound, and on being touched will fall to pieces, the scales being all clean and fresh, except just at the extreme base. The best antidote for this is to plant them between low-growing shrubs, as they serve not only as a protection from harsh winds when young, but the roots tend to absorb any excessive amount of moisture. Even with these precautions the Lilies just named are decidedly short-lived. *Lilium Brownii* of gardens needs the same treatment, but it is more robust, so that it will often succeed where the others fail. A few years ago a change in planting these delicate Lilies was advocated, viz., instead of placing the bulb upright and surrounding it with sand it was to be laid on its side to prevent the accumulation of moisture at the base. After being well tried, however, this has not turned out a success.

Lilium longiflorum, well as it does in some of the southern counties, is a comparative failure in many of the northern ones, the wet and cold winter being too much for it. True, bulbs imported from Japan will flower well the first season, after which many of the bulbs split up into several small ones, and they seldom gain sufficient vigour to flower, particularly if the situation is at all cold and damp. *Lilium speciosum* even this season looks well in many places, though a few have gone off here and there, in the way that *L. auratum* does.

THE WHITE LILY.

No notice of failures in Lily culture would be complete without mention of that charming species, the white or Madonna Lily, which has in many places fallen such a prey to disease. According to Mr. Massee this is caused by a fungus (*Botrytis cinerea*), a near ally of which has proved very destructive to the plantations of *Lilium Harrisii* in Bermuda. Various measures have been tried to prevent it, the most effectual being to spray the plants with potassium sulphide dissolved in water. This authority just mentioned recommends 2oz. of the potassium to be dissolved in 3 gallons of water. In some country districts where allowed to remain untouched this Lily may be seen in all its vigour, while in others it is

quite a failure. Large numbers of bulbs are sent to this country every year from the south of France, and in many cases this fungus has been introduced in places where it was before unknown, for these French bulbs are as a rule badly infested with the spores. Wet and cold weather greatly assists the spread of this fungus, so that it may be understood that it has this year asserted itself strongly in many places.

By some cultivators several members of the Martagon group are regarded as comparative failures, as they give poor results the first season after planting. Two of the most pronounced in this respect are *L. chalcedonicum* and *L. szovitzianum*, which will often scarcely appear above ground the first season, but continues to improve afterwards. Both these Lilies have very stout, deep descending roots from the base of the bulb, but no stem roots, hence until they are well established the results are likely to be disappointing.

Lastly, in the list of Lily failures may be mentioned several species whose non-success is owing, not to any particular disease, but to the climatic conditions being in some way or other unsuitable to them. For instance, where do we find established plants of *Lilium avenaceum*, *columbianum*, *Leichtlini*, *maritimum*, *parvum*, *philadelphicum*, *pulchellum*, *rubescens*, *tenuifolium*, and *washingtonianum*?
H. P.

AMONG THE SWEET BRIARS AND WICHURAIANA ROSES.

How strange that it was reserved for a judge of the Law Courts to give us the delightful June Roses known as Penzance Briars. How we should miss their delicious fragrance and their great vigour. What delightful variations one may make in one's garden by the help of these beautiful Roses. Arches and lofty pillars may be wreathed with them, and hedges as impenetrable as Holly may be formed, while in isolated groups they are perhaps seen in their most charming phase. What picturesque features are possible by the aid of a little wirework.

I have known standards to be formed of these Roses by making a wirework contrivance with spreading head, the Briars between entwined around the stem, and when they reached the top the shoots were spread outwards, thus making a flowering stem and head. I enjoy Penzance Briar Roses with outspreading branches bent down by the weight of blossom or flinging the long sprays over some bank or water edge.

Has anyone sown the seed of these Roses? If not, I would advise them to do so. I believe the hybrid nature will manifest itself in the offspring for some time to come. And, again, how easy for someone with leisure to carry on the good work of adding greater and more distinct variety by crossing some of the best of existing Roses. Even in the uncrossed seed one will obtain some useful variations. Then there are the

WICHURAIANA HYBRIDS,

even more remarkable than the last-named. I am very optimistic as regards the future of this group, especially as we are obtaining some that are autumn blooming. It is remarkable that the type blooms much later than the hybrid offspring. Now if we can alter this we should gain some late-flowering climbers, which would be very welcome, and apparently this is possible, as it is manifest in the variety *François Foucard*, a hybrid between the type and *Noisette L'Idéal*. But as it is these June bloomers lend themselves to most artistic arrangements, such as trailers for festoons or as weepers, and the only point that I am doubtful about is that too much will be attempted, with the result that the variety will be unappreciated through its indifferent flowers. I consider they should be cut in pretty hard now and then, say every second year, so that a quantity of new growth is promoted.

I do not see why many of these free-growing Roses should not find a home in the herbaceous border. We all know how well *Crimson Rambler* can be so utilised, and why not *Jersey Beauty*, *Dorothy Perkins*, and *wichuraiana rubra*, so deliciously fragrant, or *Reine André*, also sweetly fragrant.

A year or two ago I saw at Kew some charming hybrids of *wichuraiana*. There were some crossed with *Rugosas*, others with *Mme. Plantier*, and others with *General Jacqueminot*, and very pretty they were. One is always reluctant to add to the

already overburdened collection of Roses, but I think if we can obtain rambling Roses, hardy and free in growth, that they would be warmly welcomed.
PHILOMEL.

A GREAT MARKET ROSE NURSERY.

THE Rose in these days is grown on an immense scale on commercial lines for the supply of the ever-increasing demand for Roses in this country during winter and spring when the out of door supply is exhausted. Those unacquainted with the suburbs of London and other large cities cannot have the faintest idea of the magnitude of many of these glass establishments devoted mainly to the growth of the queen of flowers. When we consider the popularity of the Rose in England, that it is the flower most loved of all, a flower that is always welcome, and one whose fragrance and beauty can be enjoyed every day in the year, it is scarcely to be wondered that so much enterprise has been launched in favour of its growth under glass. I have on several occasions in years past visited some of the gardens of this description, and always derived pleasure and instruction from my visits, and I would like to bear testimony to the intelligent, courteous, and straightforward way I have always been received by the owners and managers of those establishments, and the frank and unhesitating way in which they communicate their technical knowledge in the growth of the subjects in which they so greatly excel.

It was only a few days ago that I had the pleasure of visiting one of these large establishments for the first time, the property of Mr. Lowe and his partner Mr. Shawyer. It is situated about halfway between the pretty village of Hillingdon and the old and interesting town of Uxbridge in Middlesex, distant from the latter place about a mile. On approaching the garden the subject first to arrest the visitor's attention is what appears to be a forest of timber erections—posts and rails without apparent ending. On closer approach the ground on which these erections were fixed was seen to be planted with hundreds of thousands of *Chrysanthemums* in batches of early, mid-season, and late varieties, and the utility of these erections then became apparent. They are erected for the purpose of supporting portable lights, which are placed over the plants when frost approaches. With this temporary glass roof and the outside of the quarters protected by tiffany, these quarters are transformed in an astonishing short space of time into houses quite impregnable to ordinary frosts, and as an adjunct to the practical value of these erections in the cultivation of the Rose and many other flowers out of doors.

I was much interested in the use made of the principle of heating erections with

PORTABLE BOILERS AND PIPES.

On the approach of exceptionally severe frosts or occasions of much rain to prevent damping, and also to hasten the maturity of crops, the application of heat by this principle to any desired plants is only the work of a few minutes. The visitor who may call at one of these establishments expecting to see the many beautiful associations surrounding a private garden will receive a very painful shock. He will see rather a

A HOUSEFUL OF MRS. JOHN LAIN ROSE IN MR. LOWE'S NURSERY AT UXBRIDGE.

manufactory, where the production of Roses or other flowers is reduced to a system as complete as that of the brickmaker turning out bricks from his yard. All sentiment is eliminated.

PACKING THE ROSES.
The first structure we entered was the packing shed. This was practically full of cut flowers, mostly Roses, all being bunched, packed, and prepared for market by an army of men, young women, and boys, a very pretty and delightful sight. I asked the manager if the flowers were chiefly intended for Covent Garden, and also if there was any difficulty in disposing of such vast quantities daily. He replied that no difficulty was found, and that markets all over Britain were supplied, and incidentally he remarked how useful a service the costermonger and the flower girl rendered the flower grower and the public by disposing of the third-rate produce at a cheap price in the streets. All the glass houses in this establishment are built of timber and glass, which are not so costly or permanent, of course, as when bricks are used for a base. Many of those I saw had been erected for upwards of ten years, and with ordinary attention to repair looked like lasting another ten years. They are open roofed, and run from 140 feet to 150 feet in length by 12 feet or 14 feet in width.

There are scores of these, covering on an aggregate from six acres to seven acres. The soil here is a strong loam, partaking very much of the character of the land in the neighbourhood of Slough and Langley, near to which is brick earth verging on stiff marl, and from which the famous bricks of this district are made. The Roses are planted in the natural soil, well enriched with manure and deeply and well cultivated. The system on which

THE ROSE IS CULTIVATED
at these gardens is simplicity itself. The varieties are few, and confined to those colours popular in the market and that are good growers, and carry bold, large, upstanding flowers. Every Rose planted is propagated on the place, and it will surprise many to know that good strong plants filling 5-inch pots with healthy roots and ample foliage fit to plant out in the permanent beds can be manufactured in thousands in the short space of three months.

They are grafted on the Briar stock in heat in the propagating house in March, and by the middle of June or earlier the best of them are ready for planting out. Here none are grown permanently in pots, but all are planted out in the centre of the house, leaving a path running round on either side, with borders planted at the side as well. A great number of these houses are well heated for the production of early Roses, others partially heated, others without heat at all, and some planted in the open, in the temporary timber erections for portable glass lights only, thus securing a long continued succession of splendid flowers without a break, and this

all the year round with the help of the many acres grown out of doors for summer and autumn supply. The Roses under glass during their growing season are liberally supplied with water, and frequently helped with artificial manure stimulants. I am not aware of there being any special Rose manure on the market, but Clay's is much favoured.

CUTTING THE ROSES.
Much importance is attached to this, and only by practice can the right time be chosen for the flower to be cut so as to reach the market in the most perfect state. Importance is now also attached to the practice of cutting a long stem with the flowers, often 2½ feet long, preserving its natural grace and beauty when artificially arranged, instead of dumping it down on squat stems as used to be generally the custom. The Rose is placed in water immediately it is cut, and it was a new practice to me in some of these gardens I visited to see the flowers gathered, men taking with them a flower-pot partly filled with water to place the flower shoots in, instead of the usual basket in universal use. By taking this precaution the chance of the foliage or flower flagging is reduced to the greatest possible minimum, and must greatly help to prolong their bright and fresh appearance.

VARIETIES.
In pinks Mrs. John Laing still retains its well-earned popularity as being one of the very best. Its large flowers are borne on bold, erect stems, and the foliage is perfect. Mrs. Sharman Crawford, a darker shade of pink, inclined to rose, is also highly thought of and grown by the thousand; Mme. Gabriel Luizet, still one of the best all-round pinks; and La France, considered indispensable. Flesh colour: Baroness Rothschild is the most highly thought of, and is grown in large

numbers. Scarlet Roses are confined almost entirely to General Jacqueminot, and for very dark to Duke of Edinburgh. In whites Niphetos, The Bride, and Boule de Nieve, the latter grown in great quantities for wreath making. The above are the varieties grown in great bulk at this establishment. In scarlets Liberty, a new Rose of recent introduction, in the opinion of many good judges, will supplant the General for market purposes. It is a more compact and better formed flower, travels well, and the centre never opens. Other varieties favoured are Mme. Testout, Mrs. Grant, Catherine Mermet, and Abel Chatenay, Bridesmaid, and William Allen Richardson. Maréchal Niel is only sparingly grown.
Other flowers grown in large quantities are the following: Chrysanthemums, Lilies, Iris, Gladiolus, Poppies, and of bulbs, mostly Tulips, 30 tons are annually bought for forcing into flower under glass. Upwards of 100 hands are employed all the year round.
OWEN THOMAS.

NOTES ON NEW EXHIBITION ROSES.

New, as applied to Roses, is a somewhat elastic term, but I will confine my notes to the Roses introduced during 1901, 1902, and 1903, unless there should happen to be some Rose introduced before 1901 that seems to me to call for special notice. I ought to mention that I have seen growing the great majority of the Roses I attempt to describe, either in the nurseries of the trade specialists or in the gardens of our keenest amateurs. There are, however, some which it is impossible to omit if these remarks are to have any pretence of being up-to-date, but which, owing to their too recent introduction, I have not been able to see. As to these I have relied on the

ROSE LA FRANCE IN A MARKET NURSERY.

opinions of those growing them (often, it is true, for the first time), and to whom I am much indebted for the information which I now hand on to your readers.

New Roses are necessarily of most interest to the exhibitor; he it is who must continually be adding to his collection if he is to keep in the front rank, so I will deal in this article with exhibition Roses only. I am writing these notes before any Rose exhibition for 1903 has taken place, but, as I hold strongly that it is quite useless to write of a Rose as exhibited—one must see it growing not only as a maiden but as a cut-back before one can speak or form an opinion as to its merits—the fact is of not much importance.

Alice Lindsell.—A gold medal Rose, introduced in 1902 by Messrs. Dickson and Sons, and well shown by them last year. A Hybrid Tea, distinct; colour creamy white, with a pink centre; a good grower of robust habit; will doubtless become very popular. The plants I have seen look well, despite the trying winter.

Alice Grahame.—Another of Messrs. Dickson's famous Hybrid Teas sent out this year. This is one of the Roses I have not seen growing, but the raisers speak very highly of it, although it is of a colour that we have too much of among our exhibition Roses—ivory white, tinted salmony pink.

Ards Pillar.—A fine-coloured Rose; has been exhibited, but will require a cool summer; a good grower, but one that will be more in demand for garden decoration than the show-bench; undoubtedly a first-rate pillar Rose, with excellent foliage; also one of Messrs. Dickson's productions.

Ben Cant.—Some wonderful flowers of this have been exhibited by the raisers, Messrs. B. R. Cant and Sons. Its colour alone will induce everyone to try it. It is undoubtedly one of the finest H.P.'s of its colour ever raised. A good grower, with scent of the Victor Hugo type, but bolder in form. A fine bloom of it obtained the silver medal for the best Rose in the show at Brentwood, and it has also been awarded the National Rose Society's gold medal. One of the best of the new Roses.

Duchess of Portland.—A gold medal Rose of 1901 from the Irish firm, pale sulphur yellow Hybrid Tea; will, I think, be very popular amongst exhibitors. Robust rather than vigorous in growth; but one cannot have everything. Several of our leading amateurs have spoken very highly to me of this Rose. It is free flowering.

Dr. Felix Guyon.—A Tea of excellent colour. I have only seen one flower of it; colour deep orange shaded apricot. This Rose is spoken very highly of on the Continent, and was raised by A. Mari. It obtained two first prizes when first exhibited at the Paris Exhibition of 1900 for the best flower in its class, and also for the best flower of its colour; but I am afraid its shape is against it as an exhibition Rose, though no doubt it will occasionally come good enough.

Edith Dombrain.—Another hybrid Tea from Messrs. Dickson's, of last year's introduction, a fine flower as exhibited by the raisers, but the plants I have seen did not promise to grow quite as well as one would wish. Good shape, colour ivory white, with a suggestion of a flesh

ROSE MRS. SHARMAN CRAWFORD GROWN FOR MARKET.

tint. It was awarded a gold medal, and I hope for the sake of the name it bears it will be found a good grower.

Florence Pemberton.—This, I am inclined to think, will be found the best of Messrs. Dickson's new Roses of the last three years. It is being distributed this year, and no doubt there will be a great demand for it. It was awarded the gold medal at the Northern show of the National Rose Society at Manchester last year, when Messrs. Dickson staged over 100 blooms. Its form is excellent, full high-pointed centre, with fine large petals. It is a good grower, colour creamy white with a suspicion of pink. We shall undoubtedly hear more of this Rose.

Frau Karl Druschki.—This grand Rose of 1901 comes from the well-known firm of Peter Lambert, and of the many good Roses we have had from them I doubt if any one beats this variety. It is universally admitted to be the best white H.P. in cultivation. Some grand flowers have been exhibited by the leading amateurs and the trade, and it will be indispensable to all exhibitors.

Frau Peter Lambert.—A new Rose of 1902, raised not by the owner of the name it bears, but by Welter. It is described as a pink Kaiserin A. Victoria. I have heard it spoken well of (Mr. Frank Cant, that excellent judge, thinks highly of it). It is undoubtedly the best of the three sports or seedlings of K. A. Victoria sent out by this firm.

Gertrude.—Another of the Dickson 1903 Roses. I have seen it exhibited by the raisers. It is best described as a pale blush Countess of Caledon. A Hybrid Tea.

John Ruskin.—Originally known under the name of Janet Scott. A Hybrid Tea that has been exhibited for some years by Messrs. Dickson, a good flower with scent, colour rosy carmine. A good grower; last year's plants are very strong and looking well.

Lady Moyra Beauclerc.—A Rose that was exhibited by the raisers (Messrs. Dickson) some time before being placed in commerce. Its

colour is slightly against it, as it does not stand well, madder-rose, at its best on cut-backs. Still will be found useful, fine shape, very massive, but not very vigorous in growth.

Lady Roberts.—Too well known now to need description. Raised by Messrs. Frank Cant and Co., it has been in great demand. It will require a cool season for exhibition purposes, but it is a Rose that everyone will buy for its distinct colour. It was awarded two gold medals last year, which is, I believe, a unique distinction, which was, nevertheless, deserved.

Mamie.—A very pretty Rose this, bright rosy pink deepening to carmine; sent out in 1901 by Messrs. Dickson. The petals are of a good substance with a distinct yellow base. I think it will become popular when better known. It is a good grower, and can be recommended.

Mildred Grant.—The giant among exhibition Roses; a wonderful flower, and one which every exhibitor must have. Splendidly shown by the raisers, Messrs. Dickson. A very fine bloom of it was exhibited at the last Temple show (1902) by Messrs. Frank Cant and Co., where it was awarded the silver medal for the best H.T. in the show. The same growers secured a similar medal for it at Manchester. If it had only been a different colour what a sensation this Rose would have caused, but it is creamy white with a suggestion of pink, one might almost say "as before." Needless to say this Rose secured the coveted gold medal.

Muriel.—A good H.P. raised by Messrs. Frank Cant and Co., deep salmon pink; should be good this year, as cool seasons suit it. It is a good grower, and can be well recommended.

M. Paul Liede.—A bright pink Hybrid Tea with fine large deep petals, forming a beautiful outline with a high-pointed centre. A good grower and a free bloomer. I have not seen this Rose, but the above description reaches me from a well-known grower.

Milton.—One of Messrs. Wm. Paul and Son's introductions. Growing as a maiden I did not think much of it, but I am told that

it is a fine exhibition flower on cut-backs. In colour a bright carmine, reflexed silver, and good shape. It has been exhibited in fine form, and is a good grower.

Perle von Godesberg.—Another sport from K. A. Victoria, golden-yellow in colour, that I have received excellent reports of. One of Lambert's raising, and sent out in 1902. I have not grown it.

Prince de Bulgarie.—Sent out last year by Pernet-Ducher. It is a good Rose, colour rosy flesh, shaded salmon, flowers of good size and substance. It attracted considerable attention in the early part of the year when exhibited at the Royal Horticultural Society's meetings in the Drill Hall by Messrs. Frank Cant and Co., who speak very highly of it. In shape it is similar to that fine Rose *Souvenir de President Carnot*.

Souvenir de Pierre Notting.—This Rose gained a gold medal for Messrs. Prince when exhibited by them at the Rose show in the Temple Gardens last year. It was raised by Messrs. Soupert and Notting, and is best described, perhaps, as a yellow *Maman Cochet*. It is distinct and a very beautiful variety, with a fine long bud developing into an excellent flower. Its colour will make it a welcome addition to the exhibitor's box, and it is sure to be largely ordered in the autumn.

This concludes the list of those exhibition Roses that can be described as new that I have met with in some way or another. I hope to deal with the garden and decorative Roses at some future time.

HERBERT E. MOLYNEUX.

Brantwood, Balham, S.W.

ROSE NOTES.

ROSE AMY ROBSART (A PENZANCE SWEET BRIAR).

THE accompanying illustration depicts the hybrid Sweet Briar Amy Robsart upon a wall. It was planted in March of this year, and now covers a space of 10 feet by 8 feet. I think it is one of the most satisfactory of single Roses for covering a large space in a very short time.

ROSABIAN.

ROSES AND DEAD TREES.

In many an old garden there are aged fruit trees, and one hears the remark that such and such trees are dying, yet they are kept for old acquaintance sake so to speak. I have at the present time under my charge an old orchard, and my employer is very fond of the trees, and two years ago we thought we would try and turn them into masses of flowers by planting climbing Roses. I know of no better way of showing the beauty of such Roses as *Carmine Pillar*, *Crimson Rambler*, the *Dawson Rose*, *Paul's White*, *Dundee Rambler*, *Bennett's*

PENZANCE BRIAR AMY ROBSART AGAINST A WALL.

Seedling, and *Alfred Carrière*. I think one of the very best is *Electra*. Another lovely class is that comprising the beautiful *Penzance Briars*, *Anne of Gierstein* and *Amy Robsart*. We have all these doing well. I find the best way to start them is to take a hole out on the best side of the tree about 3 feet square and 2 feet deep, and fill it in with good loam, road sand, and some well-decayed manure. Leave the part where the Rose is planted a little lower than the other, so that the water does not run away from the Rose. A very good way of training is to nail some of the strongest shoots to the trunk of the tree, and as soon as they reach the branches train some of the weaker ones over these, and in a very short time the old dead tree will be a mass of bloom. J.

ROSE FORTUNE'S YELLOW AT LOCKINGE.

THIS delightful old Rose seems to have particular tastes of its own. Perhaps nowhere in the country does it flower better than at Lockinge. There it grows like a common Briar under several conditions both inside and out, and yet Roses generally do anything but well there, the natural soil being too much charged with lime. Mr. Fyfe grows this variety on its own roots. Many stout shoots upwards of 10 feet are made in a season, and all through the spring thousands of blooms are cut for decorative purposes, and whether used in the daytime or under artificial light the delicate tints

never lose their softness and beauty. Immediately the flowering season is over Mr. Fyfe prunes early so that a good, well ripened growth is made before winter. E. B.

[This Rose was illustrated in THE GARDEN of May 30, and the accompanying note should interest those who know *Fortune's Yellow* only as an indoor variety.—ED.]

ROSE PEACE.

If this proves as good a Rose as the variety from which it sported, namely, *G. Nabonnand*, we shall have a pale citron-coloured bedding Rose of rare beauty. Of the many lovely Roses Messrs. Nabonnand have enriched our gardens with there is nothing more useful or beautiful than *G. Nabonnand*.

PERLE VON GODESBERG (H.T.).

This is supposed to be a yellow sport of *Kaiserin Augusta Victoria*, but whilst granting that there is more yellow in the centre of the flower than in the parent variety, it is rather a mistake to call the Rose a yellow *Kaiserin*. I quite expect that we shall obtain a decided yellow from this valuable Rose before long, for it has decidedly sportive inclinations, which are manifest in the grand climbing form, which is one of the best climbers one could plant in a conservatory or south wall out-doors.

NOELLA NABONNAND.

This splendid new climber partakes largely of the growth of *Reine Marie Henriette*, from which it emanated, Messrs. Nabonnand having crossed this Rose with *Bardou Job*. The distinctive characteristics of the variety are its enormous petals. If they were just a little brighter I should have liked the Rose better. The purplish hue is rather a detraction, although I must admit I have only seen flowers upon young plants. I can imagine what a gorgeous sight a wall would be covered with this variety. Its fine long buds will be most useful. It is a semi-double flower, perpetual, very vigorous in growth, and cannot fail to be one of the best high-coloured wall or pillar Roses. P.

COLOURED PLATE.

PLATE 1262.

PRIMULA KEWENSIS.

PRIMULA KEWENSIS is a hybrid between the Arabian *P. verticillata* and the Indian *P. floribunda*. It originated at Kew five years ago, where the two parents are grown together in a greenhouse, the cross being due probably to the agency of insects. Seeds ripened on the plants of *P. floribunda* were sown, and amongst the seedlings was one with distinct foliage. This was grown on, and when it flowered it bore conclusive evidence of its hybrid origin. Precisely the same thing occurred two years later, the second cross being slightly different from the first. The

Supplement to
"The Garden," July 4th, 1903.

PRIMULA

whole of the stock of the first cross was secured by Messrs. James Veitch and Sons, who have been most successful with it, and the beautiful batches of it exhibited by them this year were examples of skilful cultivation, and at the same time a proof of the exceptional merits of the plant. There are so many beautiful Primulas that it is not easy to say which are the best, but certainly I should place *P. kewensis* in the first half dozen. It is easily grown, of sturdy constitution, forms a shapely plant, and when at its best makes an elegant display of bright green foliage and graceful racemes of clear sulphur yellow flowers, lasting for about two months. When the flowering season is over the plants may be repotted and grown in a cool frame during the summer and autumn. In winter an airy greenhouse such as suits *P. sinensis* is the best place for them. So far no seeds have been produced by *P. kewensis*, but a stock of plants can easily be obtained by division.

The occurrence of a genuine new hybrid Primula is an event of some interest. So far as is known no one has yet raised a hybrid Primula by artificial means, although the most skilful of plant breeders, naturally, have tried.

That the species will cross is proved by the occurrence of wild hybrids and by the origin of *P. kewensis*. Nature, although she seldom puts it in practice, knows the secret of hybridising Primulas, and we come very near discovering it when we find her at work in a greenhouse at Kew. This year we have had a collection of various species of Primula in flower standing close together in a suitable house, where the conditions were, we thought, such as would lead to crosses being effected, and although this method is far less certain than that of camel-hair brush, &c., is in other cases, we may hope from what happened when *P. kewensis* was started that the same thing may happen when such species as *P. sinensis*, *P. obconica*, *P. japonica*, *P. megaseæfolia*, and of course *P. verticillata* and *P. floribunda* are placed side by side with their flowers all mingled together.

I have just measured a leaf on one of the Kew plants of *P. kewensis* and find it 13 inches long by 4 inches wide. There are a few odd flowers on the plants now. W. W.

[The drawing was made from a plant in Messrs. Veitch's nursery at Chelsea by H. G. Moon.—Ed.]

THE GARLAND ROSE.

This fine old favourite is by no means eclipsed, even by the many beautiful free-growing cluster Roses of the Rambler class that of late years have added such good things to our gardens. Its dainty warm white clusters, specially beautiful in the early morning when the buds are opening and showing their young tinting of shell-pink and flesh colour, have a charm of their own that is scarcely equalled by any other, and the blooms are yielded in the most lavish profusion.

G. J.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

ACRIDOCARPUS NATALITIUS, *Alberta magna*, *Berlandiera tomentosa*, *Callistemon salignus* var. *alba*, *Gardenia rothmannia*, *Grevillea Banksii*, *Isoplexis canariensis*, *Mimulus glutinosus*, *Mitraria coccinea*, *Oxyanthus natalensis*, *Primula imperialis*, *Talauma Hodgsoni*, and *Vincetoxicum purpurascens*.

Palm House.

Aristolochia brasiliensis, *Odontadenia speciosa*, *Passiflora cornuta*, *Pavetta caffra*, and *Theophrasta Jussieni*.

Water Lily House.

Eranthemum hypocrateriforme and *Ipomoea Hardingii*.

THE GARLAND ROSE IN A BERKSHIRE GARDEN (PLANTED TWO YEARS AGO LAST MARCH).

Orchid Houses.

Aerides crassifolium, *A. odoratum*, *Bulbophyllum barbigerrum*, *Calanthe japonica*, *Catasetum planiceps*, *Cattleya Aelandiae*, *Cirrhopetalum robustum*, *Cymbidium rhodochilum*, *Cypripedium Curtisii*, *C. Ledouxæ*, *Dendrobium infundibulum*, *Diplocentrum congestum*, *Dista tripetaloides*, *Epidendrum elongatum*, *E. raniferum*, *Hemaria dawsoniana*, *Lælia digbyana*, *L. purpurata*, *Lycaeste Deppel*, *Maedevallia bella*, *M. macrura*, *M. muscosa*, *M. reichenbachiana*, *Mystacidium augustum*, *Oncidium candidum*, *O. exasperatum*, *O. luridum*, *Ornithocephalus grandiflorus*, *Polytrichya Zambesiae*, *Stanhopea saccata*, *Theodora gomezoides*, and *Thunia veitchiana*.

T Range.

Æchmea dealbata, *Eschynanthus lobbiana*, *Arisæma* in variety, *Goniocyptha eucomioides*, *Isoloma* in variety, *Pitcairnia undulata*, *Tillandsia tessellata*, and *Tradescantia crassifolia*.

Succulent House.

Cereus Macdonaldii, *Opuntia monacantha*, and *Senecio subscandens*.

Greenhouse.

Similar plants to those mentioned last time.

Rock Garden.

Allium narcoissiflorum, *Asperula suberosa*, *Bulbifera Hookeri*, *Calamintha grandiflora*, *Calceolaria polyrhiza*, *Campanula spicata*, *Dianthus neglectus*, *Erinus alpinus*, *E. glaberrimus*, *Hypericum polyphyllum*, *Linaria alpina*, *Meconopsis paniculata*, *Polygonum bistorta*, *Primula sikkimensis*, and *Wahlenbergia dalmatica*.

Herbaceous Borders.

Allium acuminatum, *A. albo-pilosum*, *A. urceolatum*, *Astragalus chinensis*, *A. ponticus*, *Gillenia trifoliata*, *Kniphofia kewensis*, *K. rufa*, *K. Tuckii*, *Lathyrus grandiflorus*, *Lychnis chalcedonica*, *L. Githago*, *Poterium officinale*, *Scabiosa caucasica*, *S. leucophylla*, and *S. longifolia*.

Owing to the heavy rains and lack of sun very few outdoor plants are in flower.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

PYRETHRUMS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Mr. J. Cornhill (see page 348 of THE GARDEN) has done well to direct attention at this time to these showy and beautiful flowers. It would appear, however, that the notes in question are the experience of one place, and it is not unnatural that the advice tendered does not agree with that for other localities. Indeed, in localities so widely apart as Hampton, Middlesex, Birmingham, Cheshire, and Tooting, to go no farther, and in all of which I have had experience of growing these things in large numbers, it does not quite fall in line. How and when Pyrethrums may be divided and replanted depends not altogether on the season but in a far greater degree on how the work is done, the class of soil to be dealt with in the replanting, and so forth. For example, there is no comparison—when it comes to replanting out of season—between the freshly-established pot plant of two months potted and the roughly, crudely divided clump of the moment. The pot plant may possess two or even three crowns, and the sectional part of a large clump thirty or ten times the number. Yet I would stake my reputation as a hardy plantman that the pot plant of my growth, if to go in a light, well-drained soil, may be planted within six weeks of Christmas, and, by its continued growth of root and leaf all the winter long, be the larger of the two examples named, capable of giving the best results at flowering time the following June. The reason is obvious. The pot-established plant just noted may have been taken in hand in the early part of September, pulled into quite small examples, potted and framed, and

therefore quickly re-established. In November such plants are not only teeming with young root fibres, but these fibres in light soils continue, and the top growth also in open weather all the winter through. I have planted freshly-established pot plants from both the spring and autumn division by the thousand over many years, with perhaps hardly the loss of a single plant per thousand. On the other hand, I have seen the work of others who, believing their stock of plants large enough to permit of dealing with in a more rough and ready way, divide the clumps with a spade or other tool, and after replanting and watering for some time lose more than two-thirds of the plants so treated.

Some years ago a well-known man in the nursery trade called upon me in this district. Noting that I had a large lot of Pyrethrums, he enquired the price, and said he would take 100 plants. I told him my rule was to first select my own and give the trade buyers their pick after, but as I had so many—and I had some thousands at the time—I told him he was welcome to select his own. He did so and departed, as he had good reason to, well satisfied. This was in September or October. Some weeks later—in fact, from the middle to end of November—I planted about an acre from this same stock, reserving still a large supply of good plants for orders. At planting time these young pot plants were teeming with fresh-growing roots, and in my light soil I had not the least thought of any loss. To the best of my knowledge and recollection there was none, or next to none. This large area was full of growth all the winter, so to speak. Judge of my surprise, therefore, when in early spring the gentleman referred to above called on me to say that "all those Pyrethrums died that I had of you last season." "Indeed," I said, "what did you do to them?" "Oh! I took every care of them," he remarked, "and framed them for the winter." "Which," I said, "is just what I would not have done," inviting him at the same time to come and see my beds planted in the open, where you see them weeks after you had had your pick. He could not understand it, he subsequently remarked, but I assisted him in this matter by suggesting that his frame and the many slugs it encouraged were the chief causes of his loss. Hence, I repeat, there is a difference in the ways and means, and the plants would have been infinitely safer plunged in ashes in the open. Such perfectly hardy things require no frame coddling except as a means of propagation. When large plants are pulled to pieces the frame is a valuable aid. But it must always be unheated.

Heated frames are frequently the cause of many failings. I am certain that no method is more simple than the pot one, not merely for increase, but for ensuring success also. Many require clumps from the open ground, and such may be a success when properly planted in the right season. In early spring such clumps plant quite well. Again, in early September, the June-flowered examples may be divided and replanted with a fair measure of success in light soils if well cared for. In cold and wet soils it is by no means wise to delay the planting; indeed, I know instances where the plants entirely disappear in winter on heavy soils over the liss formation. In all such spring planting freshly-established pot plants are the best. As I have seen the Pyrethrum buried fully 6 inches below the level of the crowns in high-class gardens, a word of warning may be necessary to avoid repetition. The crown stock should be on a level with the surface in every case. As Mr. Cornhill rightly observes, these plants delight in moisture during growth and flowering, and, in short, in all seasons of drought.

As to varieties Carl Vogt and Aphrodite, among white kinds, are great advances over Mont Blanc and its allies of nearly thirty years ago. The two first-named are very pure and large. Melton is very fine, but Imbricatum is no longer worth a place among doubles. Alfred is a fine crimson and so is Meteor. Of other good doubles let me name Florentine, bluish; Celia, pink; Ormonde, rosy red; Pericles, gold, with creamy gold petals, a most fascinating kind; Wega, buff, very fine; Empress Queen, bluish; Duchess of Teck, pink;

and Cleopatra, yellow and white. These have all been for years in cultivation, and represent the finest types of the double Pyrethrum in cultivation to-day. The list of varieties is a long one, and this is a greater reason for eliminating those of secondary value.

Hampton Hill.

E. JENKINS.

HOUSE GROWN FRUIT.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—On reading the paragraph on "House Grown Fruit," on page 410 of THE GARDEN, one is led to ask, is Mr. A. Dean quoting Mr. Hudson correctly when he makes him say "Cherries will not do in the same house as other stone fruits, Peaches, Nectarines, and Plums?" That it is a great convenience to have separate houses for each kind of fruit every gardener will admit, but ripe Cherries may be had by the end of May or earlier in Orchard houses provided with one row of hot-water pipes round them to warm or dry the air of the house as circumstances may require during the early period of growth. The cool buoyant atmosphere required by the Cherry will in no way interfere with the successful fruiting of Peaches, Nectarines, or Plums; it will only retard their ripening. To the amateur who seeks change and recreation in his garden what can there be more enjoyable than a house where the Peach, Nectarine, Plum, and Cherry can grow together, and give a feast to the eye during the period of blooming, and to the palate during the season of ripe fruit. I have a pleasing recollection of such a house, a large one I admit, where the fruits named, and also the Pear and the Apricot, found a place and gave a fair return for the labour expended. There *Maréchal Niel* and *Devoniensis* Roses covered the pillars and were trained near the roof, and *Rhododendrons* in pots, *Lilacs*, and other flowering shrubs added variety.

GARDENER.

THE DODDER.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Your note on this curious parasite reminds me of one which was introduced some years ago as an ornamental plant, and called the Golden Dodder. I am not sure if it is *Cuscuta reflexa*, for which Mr. William Bull received a first-class certificate from the Royal Horticultural Society in November, 1865, but it was a little after that date that I grew it. It was sown with Sweet Basil (*Ocimum basilicum*), and the tiny thread-like plants soon attached themselves to the Basil, and after it once got a start grew rapidly, completely covering the Basil with long, slender golden-yellow thread-like shoots, branching out in all directions; although an interesting and rather pretty curiosity, I do not think it became generally known. A few years ago I found one of the Dodders (I think it was *Cuscuta epithymum*) very troublesome among Heaths; it came with the peat used for potting, and among bushy plants of *Erica gracilis* and *E. hyemalis* proved very destructive. It required a good deal of patience to properly rid the plants of it, for if the smallest piece was left it would soon spread and cripple, if not entirely kill, the plant.

A. HEMSLEY.

THE CHISWICK FRUIT AND VEGETABLE SHOW.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It has been said by several gardeners that it was exceedingly fortunate that the council of the Royal Horticultural Society had arranged to hold an exhibition of vegetables at Chiswick in September next in conjunction with the annual fruit show, as fruit being very scarce generally this year that element in the exhibition must of necessity be limited. It is greatly to be hoped that if fruit be scarce generally, yet all the same some growers here and there may be fortunate enough to have fair crops, and will exhibit their produce, whilst, however, there is ample time for vegetables to develop all their customary points of excellence and thus make up a very fine display. The season

so far has hardly been helpful to that end; growth is very slow, and hence very late. The best recent crop has been Cabbage, which generally has been good. Peas barely fill at all, because soil is so cold and there is such a deficiency of sunshine. Potatoes grow slowly, and in many breadths the lower leaves have browned, evidently having been chilled. These, it is feared, may early fall a prey to the disease, which invariably begins its destructive operations close to the ground. Moulding up has been greatly hindered by such persistent rainfall, and now many breadths will have to be left unmoulded, as the operation is hardly practicable after the tops have become of appreciable height. Where breadths are planted on stiff retentive soil any surface working has been impossible. Weeds, too, have given much trouble, and as the hoe could not be used with advantage, pulling has had to be resorted to. Tender plants, such as Kidney Beans, Tomatoes, and Vegetable Marrows, seem scarcely to move. With a return of warmth no doubt they will directly, but these cold checks do materially retard crop production. The season so far has been a very trying one for gardeners, who are so commonly expected to supply everything asked for, irrespective of seasons. A. D.

THOUGHTS ON GARDEN ROSES.

WHAT IS A "GARDEN" ROSE?

I MUST confess ignorance as to the exact meaning of the term "garden" Rose, and no doubt many rosarians are in the same difficulty. If we refer to the catalogue of the National Rose Society we find no definition of the term, but simply a hard-and-fast line to separate the exhibition from the garden Roses. This division at first sight appears an absolute necessity, but, at the same time, it must be borne in mind that it is open to no small amount of criticism. That such Roses as La France, Marie Van Houtte, Hon. Edith Gifford, Maman Cochet, and its white variety should be excluded from an exhibit of garden Roses, simply because they are classed as exhibition varieties, is unfortunate, because it is apt to mislead those who are more or less unacquainted with Roses generally. Many visit Rose shows in order to find out for themselves what varieties are likely to prove most suitable and attractive for ordinary garden use. They are sure to have been warned beforehand not to plant exhibition Roses, and the result is that they make their choice from amongst the exhibits of garden Roses, and by so doing often omit some of the most valuable varieties from their selection. The question will be asked: But how can this be avoided? And it is by no means easy to give a reply. I can only throw out as a suggestion that Roses of proved garden value which are now classed as exhibition varieties should be allowed to be exhibited in either section.

If we turn to the official catalogue of the National Rose Society we find a number of varieties which are included and described in

the lists of exhibition Roses recommended as good garden Roses. To give but one instance, we find that Maman Cochet is described as "a grand exhibition and garden Rose." At the same time we find that to exhibit it as a garden Rose would mean instant disqualification. It can scarcely be wondered that the outside public are both puzzled and misled by the use of such ambiguous expressions. What is meant by the term "garden" Rose? would certainly be a knotty question for a horticultural examination paper, and might perhaps be productive of a useful definition. Perhaps, however, some of my brother rosarians may have some suggestions to make on the subject;

their wants as regards protection are attended to. But what I am most anxious to point out is that raisers are not striving to produce hardy varieties, simply because the public has now ceased to demand them. This statement is certain to be called in question, but if we refer to the catalogues of any of the leading growers we find many good Roses of proved hardiness dropping out in favour of varieties most of which have not yet experienced a severe winter. Even when new varieties (such as single Teas, for example) are being distributed, in many cases great stress is laid on the fact that they are perpetual flowering, and no mention as to their hardiness is made.

Provided that they are tolerably fair growers and floriferous and fragrant it would appear to suffice. It is quite time, however, to sound a note of warning. One of our highest authorities gives it as his opinion that a marked improvement has taken place in Tea Roses, partly owing to "their greater hardiness and vigour." This is all very well as far as it goes, but let us for the sake of comparison take the following twelve dwarf-growing varieties, all introduced prior to 1894.

	Date of Introduction.
Marie Van Houtte ...	1871
Hon. Edith Gifford ...	1882
Marie d'Orleans ...	1884
Maman Cochet ...	1893
G. Nabonnand ...	1889
Anna Olivier ...	1872
Francisca Kruger ...	1879
Mme. Lambert ...	1877
Mme. Hoste ...	1887
Souvenir d'un Ami ...	1846
Souvenir de S. A. Prince ...	1889
Homère ...	1859

These are all capital free-growing Roses for the garden, of proved hardiness (for Teas), possessing good constitutions; in fact, just the varieties I should plant in quantity in cold localities. To bring the list more up to date I should include White Maman Cochet in place of Homère. Of course, I am fully aware that it has taken a great many years to produce the twelve grand varieties named in the above list, but, on the other hand, we must bear in mind that where one Tea Rose was grown ten years ago, probably twenty-five at least are now used. This demand has greatly stimulated raisers in their efforts to produce good garden Teas, and many lovely varieties have been put into commerce. But how

many of these new varieties are as hardy as those to which I have referred? Not many, I am afraid, will emerge from the test of a severe winter as successfully as these older ones. I have formed this opinion after testing many of them myself in a cold midland valley only 150 feet above the level of the sea, where such shrubs as Darwin's Berberis and Laurustinus do not by any means prove hardy. And this I find is the general experience of rosarians in this part of the country.

Now let us refer again to the National Rose Society's catalogue, and look through the list of garden Teas. Here are a few of the varie-

TEA ROSE PRINCESS MARIE OF ORLEANS (REDUCED).

at any rate, the matter appears worthy of further discussion. I shall always maintain that the most important point to consider in a garden Rose is

HARDINESS.

Owing probably to the fact that we have had no severe winters of late years, this point is being almost entirely overlooked. We are most careful to study the growth, habit, floriferousness, and colour of a variety, but there we stop. Numerous writers, among them many of our highest authorities, have told us over and over again that Tea Roses are hardy; and so many of them are in an ordinary winter, if

ties which we find recommended: Beryl, Ma Capucine, Mme. René Gerard, Meta, Souvenir de J. B. Guillot, and Sunset. An exquisite range of colouring is here represented, but how many of these are tender and of poor constitution! Are these really the varieties most suited to the climate of the majority of gardens, or are we on the wrong tack? In the Hybrid Tea section we find a better state of things prevailing, although even with these the importance of hardiness ought to be more insisted upon. Some of the older sorts, such as La France, Grace Darling, Gustave Regis, Caroline Testout, and Viscountess Folkestone, are very hardy, and just the ones we want more of. Perhaps the sooner we have a hard winter the better for the Rose. People will then think more of hardiness than is the case at present, and when they come to replant their Roses after the frost there will be such an enquiry for the hardier varieties, that raisers will be forced to concentrate their attention more on this point than they appear to have done of late.

In "The English Flower Garden" a list is given of the Tea-scented Roses that can be trusted in any season. One of these is *Princesse Marie d'Orleans*, a noble Rose sent out by MM. P. and C. Nabonnand in 1884. It is quite the hardiest dwarf Tea Rose I have ever grown, and one sees with regret that it has now dropped out of the majority of catalogues. In directing the attention of the many readers of *THE GARDEN* to this lovely Rose I feel that I am in good company, because its merits have long been recognised by Mr. W. Robinson and Mr. William Paul, the latter describing it as "a fine Tea Rose, hardy and free." The cool summer of last year suited it to perfection, and its shapely flowers were finer than I have ever previously known them. Their colour is bright rose, shaded with pale silvery rose, and at times flushed with a deeper shade. In cool weather the base of the petals is white. The habit of growth is very strong and erect, the pale green wood being set with large bright red thorns. The photograph from which the illustration was prepared represents a bloom cut in this garden during the middle of July after a spell of particularly rough and gloomy weather. If raisers will only take a Rose such as this as a type of what an English Tea Rose ought to be, we should not find as many gaps in our Rose beds.

Worcestershire. ARTHUR R. GOODWIN.

A NEW CABBAGE (WYTHES' EARLY GEM).

The Cabbage may be grouped into three distinct classes—early, midseason, and late, and doubtless the least important is the midseason, as at that time so many other good vegetables are available. The Cabbage is an important factor to the cottager and those who require large quantities of vegetables, and the summer Cabbage has other advantages owing to its rapid growth; it is very sweet and succulent if given good culture. We know that old plants left to chance when large or coarse are offensive; these our note does not apply to, as Cabbages can be grown so quickly that there is no need to have inferior heads, no matter what the season or variety. Our remarks on this occasion more concern the newer introductions, and our illustration is of a new variety (Wythes' Early Gem). Messrs. Cutbush, of Highgate, are sending it out next season. It is remarkable for its compact growth, its earliness (it was ready in March this year), and, what is most important, its excellent quality. It is valuable on account of its size and hardiness. These small-growing Cabbages have very little stem exposed above the soil, compact or folding leaves, and are often the hardest of all. The raiser of this new variety, who takes much interest in vegetable culture, also raised an autumn or winter Cabbage, the *St. Martin*. This was the result of crossing the *Christmas Drumhead* with the *Rosette Colewort*, with the intention of getting a hardier *Colewort* with less splitting in severe weather.

Few Cabbages since they were introduced have found more favour than *Ellam's Dwarf Early Spring*, and rightly so, for it was a great gain in every way to the private grower who thought more of quality than quantity, but now we find even this excellent variety varies, and we fear there are false stocks, as only recently a large grower told us it was impossible to keep any variety true, no matter how good it was, if the seeding was not done with the greatest care. The Cabbages of more recent date have been quite as valuable. Take such kinds as

Sutton's April.—This is one of the most valuable spring vegetables that can be grown. This variety sown for the spring supply—that is, sown in July or August—is most valuable. It has not been grown many years, but its earliness and size for a private garden will have proved its worth. Another equally good Cabbage is

Flower of Spring, larger, and perhaps a trifle

later, but invaluable in every way. The same remarks apply to

Sutton's Earliest.—This is new and a close rival to *Sutton's April*. It is valuable for sowing under glass in January to follow the autumn-sown. In the north few gardens are without

Mein's No. 1 for early supplies. It is excellent, and, though later than the varieties referred to above, the locality must be considered. A Cabbage recently introduced takes some time to find its level, but it should be grown by the side of other and given a good trial, a remark which applies to all the Brassicas and other vegetables.

We have referred to three distinct seasons, and this should be observed, as by some a spring Cabbage is supposed to be available for summer. This is not so. The autumn-sown Cabbages are grown mostly for their hardiness, and in summer these conditions are reversed. There are plenty of good summer varieties, such as *Veitch's Matchless* and *Main Crop*, *Sutton's Favourite* and *Tender and True*, and *Carter's Heartwell* and *Model*, all of recent introduction, or nearly so, and remarkable for their quality at a season when the Cabbage is not at its best.

In autumn there is a Cabbage of recent introduction that is not so well known as its merits deserve; that is

Veitch's Beaconsfield, a variety of dwarf habit, conical shape, and a valuable variety for early autumn supplies. Last season it was excellent at the date named. Many would prefer to sow it in the early part of the year, say February or March, for use at the season named, though it is also recommended for autumn sowing. It was grown at Chiswick as a spring Cabbage in 1898, whereas the more recently introduced *St. Martin* was given an award in November, 1899, at Chiswick.

Winter Cabbages are often overlooked, and this is not surprising, as the bulk of the hardy Brassicas are in season at that date. On the other hand, we would put in a plea for this useful vegetable at that season, as in severe weather they suffer less than Brussels Sprouts, Borecoles, or Broccoli. Such varieties as *Christmas Drumhead*, *St. John's Day*, and the newer *St. Martin's* are distinct winter Cabbages, and by growing them with a breadth of Coleworts a good supply is available all the year round. We are aware in small gardens that there is some difficulty in securing the proper planting material, but it can be overcome by sowing a pint

THE KITCHEN GARDEN.

SOME CABBAGES OF RECENT INTRODUCTION.

DURING the past few years the Cabbage has been much improved. These remarks apply also to such Brassicas as Kales, Cauliflowers, Broccolis, and Brussels Sprouts. It must be remembered that mere size is not considered an advantage by those who require quality. This year the Royal Horticultural Society are giving more attention to vegetables than usual by holding an exhibition in their gardens at Chiswick, and, from what we can see of the arrangements made, there are no classes for recently-introduced vegetables. There may be various opinions about this, but we think an excellent opportunity has been lost. Whilst on this subject we are sure that all vegetable growers—those who take a great interest in this work—most heartily thank those who have worked hard to bring this exhibition to a successful issue (notably Mr. Alex. Dean), and we trust it may be the forerunner of many others.

of seed at the right seasons. Of course, July and early in August are important as to next year's crops, but there is a great advantage with these recent introductions, as, should adverse weather delay sowing or other causes prevent a good plant being obtained, by sowing under glass in January good results are secured only a little later than from the autumn-sown plants. By getting a small, close growth there is a great gain in time. Quality also must be studied, so that on the whole we think there has been a great gain to the amateur and private grower, and the plants are more suitable for gardens of limited size.

GARDENING OF THE WEEK.

FRUIT GARDEN.

VINES.

WHEN all the Grapes have been cut from the early Vines examine the inside borders, add a little fresh mulching if they have suffered from the weight of the crop, and keep the roots moderately supplied with diluted liquid, but guard against feeding to an excess that will force a vigorous growth and so exhaust the Vines after the wood is ripe. Keep the strongest laterals pinched to balance the flow of sap, and preserve all the old foliage by good syringing every evening, or as often as the state of the weather may render atmospheric moisture necessary.

SUCCESSION HOUSES

in which the Grapes are ripening may have more air by night and by day, with just sufficient fire-heat to keep the minimum temperature at 60°, and, when the berries have attained their full size, the afternoon closing may be discontinued, particularly where the colouring process is not going on satisfactorily. If the house contains Madresfield Court Grapes see that the borders are moist, but not wet, mulch well with some loose non-conducting material, and allow all the laterals and leaders to grow until after the Grapes are cut.

LATE HOUSES.

Muscats, Lady Downe's, and other sorts which frequently scald during stoning must be closely watched until they are considered safe. A rapid change in the atmosphere may bring on the usual fermentation of the pulp, in which case it will be well to continue a high night temperature, with diminished atmospheric moisture to prevent the berries getting cold, and to maintain a steady heat of from 76° to 80° through the day by keeping the pipes warm and by increasing or decreasing the ventilation.

CUCUMBERS.

Where the bottom heat is obtained from hot-water pipes and fermenting material combined the latter should be renovated with fresh leaves when the plunging thermometer denotes a fall to 80°, and the night temperature of the house cannot be maintained without having recourse to sharp firing. This is at all times injurious to a moisture-loving plant like the Cucumber, but never more so than when the sun strikes suddenly upon the roofs before the pipes have become cool. If the pots or beds are well drained it is hardly possible to over-water or to give the foliage too much atmospheric moisture, provided the liquid for the one and the pure water for the other is applied at a few degrees above the mean temperature of the house. As the plants will now be producing fruit at every joint over-cropping must be carefully avoided—at least, if they are to be kept on bearing throughout the summer; but where they are to be shortly removed for Melons fruit may be taken before they are destroyed. Where manure is plentiful, and frames which have been used for forced vegetables are now at liberty, a few lights under good management will give an abundant supply of excellent fruit until the early autumn-sown plants come into bearing. Instead of pulling down and rebuilding the beds, dig out a trench 2 feet wide the whole length of the frame, a little nearer to

the front than to the back, fill in with a few barrowloads of the best fermenting material at hand, and plant on small mounds of loam. A new lining is placed to the front, cover early every night, and adopt the market grower's system of shutting up about 3 p.m. with sun-heat and plenty of moisture. If straight fruit is required glasses may be used.

Madresfield Court Gardens.

W. CRUMP.

THE FLOWER GARDEN.

THE comparative rest that many plants are now enjoying after their spring activity will, towards the end of the month, give place to renewed growth. When plants cease for a time to put forth fresh buds we say they are at rest, when in fact they are busy making preparation for a fresh display. A good shower of rain or a good soaking of water will invariably cause the sap in plants to rise. But there is nothing like a shower of rain; water as freely as you will the plants will only moderately respond. Delphiniums and plants of this character should be carefully gone over and all the old flower stems taken out, this will encourage them to make fresh growth and give a good display of bloom throughout the autumn.

HERBACEOUS PÆONIES.

These will now have done flowering, and in gardens where beds can be devoted to their culture tall-growing annuals should be ready for planting between the crowns; they will make a fine display towards the end of the summer, and to do away with the untidy appearance we so often see when the foliage of the Pæonies is dying off.

ACANTHUS LATIFOLIUS.

We often hear it said of some plants they make a grand display for a time, but when they are most needed neither flowers nor leaves are to be depended upon. Here is a plant that anybody can grow, and which is in all respects excellent. The leaves are bold and noble in outline, and the plant has a tendency, rare in some things with otherwise fine qualities, to retain its leaves till the end of the season without losing freshness. In fact the only thing we have to decide about this subject is, what is the best place for it. It is one of those plants that will not disgrace any position, and will prove equally at home in the centre of a mixed bed or border of a choice shrubbery. It will do well

in the flower garden, and has not that seedy look which many things have at the end of the summer. Give it a good deep soil to grow in, and do not begrudge it attention when first planted, for, unlike many other plants, it will not trouble you again for a long time.

GYNERIUM ARGENTEUM.

The Pampas Grass deserves quite as much attention as any plant in cultivation. What is there growing in the garden or in the wild more noble, distinct, and beautiful than the great silvery plumes of this plant waving in the autumnal gales, the burial plumes as it were of our summer too early dead. The soils of very many gardens are insufficient to give it the highest degree of strength and vigour, and no plant better repays for a thorough preparation, which ought to be the more freely given when it is considered that the one preparation suffices for many years. This plant should have a somewhat sheltered position in the flower garden, so as to prevent as much as possible that destruction of the foliage which occurs wherever the plant is much exposed to the breeze. In dry seasons this plant should have abundance of water and a good mulching of rotten manure.

T. B. FIELD.

Ashwellthorpe Hall Gardens, Norwich.

INDOOR GARDEN.

MAISON CARNATIONS.

As the early-flowering plants become denuded of their flowers carefully remove old and bad foliage, and cut out the old flower stems close to the wood. Place the plants thinly in a cool airy house where plenty of air can circulate freely amongst them to harden the young growth before layering. Unless the plants undergo this preparation the young wood is generally too brittle, and in the process of layering a good number of the strongest and best layers are spoiled. This preparatory treatment is especially necessary where the plants during their flowering have been arranged closely together for effect in the show house or conservatory. A week or ten days under the treatment first referred to is generally sufficiently long to bring the young shoots into suitable condition for layering. A cold frame standing on a firm surface of ashes where the water can pass freely away is suitable for this purpose. This may be filled to a depth of 10 inches

CABBAGE WYTHES' EARLY GEM (SHOWING THE HEART).

or a foot with rough siftings of soil or other material in which the balls of the old plants are to be plunged, proceeding one row at a time cross-ways of the frame. Surface this rough soil to a depth of 3 inches with prepared light fine sandy soil, which should be in a moderately moist condition to enable it to be made quite firm. As the layers are inserted peg them with wire pegs and give them a light sprinkling with water from a fine rosed water-pot. Ventilate the frame with a small piece of lath under the light at the back or upper end, and until the layers are rooted shade them from the sun with tiffany. Unless the weather is very dull sprinkle them lightly twice each day to counteract the loss by evaporation.

BEGONIAS FOR WINTER FLOWERING.

Of these the hybrid class introduced by Messrs. Veitch is invaluable. The best treatment for this section is to keep them growing steadily during early summer, and to repot them at this season of the year in loam, leaf-soil, and sand. Place them in a somewhat close pit and give a moderate amount of moisture with shade during bright weather; if these plants are allowed to become dry and quite dormant after the flowering season they do not start again very freely until late in the year.

CINERARIAS.

Make a final sowing if not already done. The young plants from the previous sowing should be pricked off 2 inches apart into shallow pans or boxes and placed in a cool shady place in a frame or pit. Give them a light dusting with Tobacco powder to keep aphids in check.

CALECEOLARIAS.

One sowing of these will be sufficient, and should be made at once in well drained shallow pans and filled with rough material or the sifting of leaf-soil to within 1 inch of the rim. Cover with about three-quarters of an inch of fine soil composed of loam, leaf-soil, and sand pressed firmly over the surface of the pans, and if watered half an hour before the seeds are sown it will be in good condition to receive them. As these are very fine they should be only covered by placing a sheet of glass to fit closely over each seed pan. A good position in which to germinate the seeds is a small temporary frame placed at the base of a north wall where it can be kept in a cool equable condition. When the weather is dry or windy cover the frame with tiffany until the seeds germinate, when a little subdued light is helpful.

Wendover.

J. JAKES.

THE KITCHEN GARDEN.

ONIONS.

THE main crop of the spring-sown Onions having been slightly thinned will now be growing rapidly, and but little attention will be required beyond hand weeding in the rows and running the hoe through the alleys on fine days. The plants raised under glass and afterwards planted out will need similar treatment, and as these require to be worked among more frequently the hoe must be plied often in order to maintain the surface soil in a pulverised condition.

If a mulch has been laid on there will be less need for hoeing, the necessary weeding being performed by hand. The advantages of a mulch of a decayed Mushroom bed for this crop cannot be over-estimated. Great care must be taken not to damage the points of the leaves when working among them; they are extremely brittle. Liquid manure from the farmyard may be given frequently, and when possible this should be applied before the soil has become too dry or it will run away too quickly. An occasional change in the way of an approved vegetable manure may be given with advantage. This should be placed round each bulb with the hand, taking care not to place it against the bulb. A fortnightly slight dusting of soot to all Onions is highly beneficial, for, apart from the manurial properties it contains, it will act as a deterrent to the dreaded Onion maggot.

CELERY.

Complete the planting in trenches as fast as the plants become large enough. To ensure good

heads both the main crop and the late plants should now be put out, and kept well supplied with water. The early batches of plants will be growing freely, and some assistance may be given by manurial waterings to maintain healthy growth. This crop is greatly benefited by frequent dustings of soot, and if this is followed up closely from the time the plants become well established until earthing up is done it will keep the Celery fly in check. The affected leaves should be picked off and burned.

SPINACH.

It is too early to sow the varieties usually grown for winter, but a good breadth of the summer

LILIAM KELLOGGII.

varieties may be sown provided a cool, moist position is at command. It is often difficult to obtain Spinach in the late summer, especially in gardens having a light porous soil. The New Zealand Spinach may be grown as a substitute if the ordinary varieties do not thrive. This species does not suffer so severely from drought as the others.

SEAKALE.

Keep the Dutch hoe working among the plants that are being grown for lifting to force in winter. Go over the plants and cut out any weakly growths that may have been overlooked. Where two strong growths occur on one plant they may be retained, but if one be weak then remove it.

Some stimulant should now be given; two slight dressings of salt may be applied at intervals of a month, and a fortnight after the first application the plants may be dressed with decomposed seaweed or farmyard manure. Guano is also very beneficial.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

NEW AND RARE PLANTS.

LILIES AT HOLLAND HOUSE.

THAT one Lily received a first-class certificate, and another an award of merit, at the recent exhibition at Holland House shows that the genus was well represented. The first to mention is that upon which a first-class certificate was bestowed, viz.,

LILIAM AURATUM PLATYPHYLLUM (SHIRLEY VAR.).

It is certainly a very fine form of the broad-leaved variety of *L. auratum*, the plants shown being about 6 feet high, while the flowers are very large, of a particularly waxlike substance, and the petals are white, save for a golden band down the centre of each. There is an entire absence of the spotting so pronounced in most forms of *L. auratum*. It appears to be a particularly well grown form of a Lily sent to this country from Japan in limited numbers under the name of *Lilium auratum platyphyllum virginale*. The form exhibited is said to have been planted as a single bulb many years ago at Shirley, and to have increased since then in a wonderful way. It certainly formed a feature in Messrs. Wallace's notable group.

LILIAM KELLOGGII.

This Lily, shown by Messrs. Barr, was perhaps the most interesting species there, and an award of merit was given it. In general appearance it suggests a hybrid between *L. pardalinum* and *L. rubescens* or *L. washingtonianum*, probably the first named of the two. Mr. Carl Purdy, who named this Lily, says that the bulb is small, like *L. columbianum*, while the leaves are in regular whorls much as in *L. rubescens*. The flower, however, is very intermediate in character, approaching more nearly to *L. pardalinum* in shape, while the colour is a warm rosy purple on the upper half of the petals, with the centre lighter and freely dotted with rich purple. A good illustration of this Lily and description by Mr. Purdy were given in THE GARDEN for May 11, 1901, the former of which we reproduce. It is a native of the Redwood region in Humboldt County, California, and like many other species from the same district will probably prove difficult to grow.

THE FRUIT GARDEN.

TRAFALGAR STRAWBERRY.

ALTHOUGH the flavour of an edible fruit should be its most important attribute, appearance must not be overlooked. In the case of Strawberries, size often carries with it a certain weight, while variety is sometimes appreciated and sought after. With the latter point in view we have this season given the Trafalgar Strawberry a trial for late forcing, and, not having noticed any remarks concerning its use for this purpose, our experience may not be altogether uninteresting. This, perhaps, may be best given by comparing it with that of Royal Sovereign, a variety that has deservedly become generally popular, and which I venture to say has no equal for forcing when all its qualities are taken into account, though in the

case of the Laxton this judgment may be premature, as a trial in a small way, which is all that we have given it, cannot be considered reliable. I hope this may prove to be true, for valuable as Royal Sovereign, especially for forcing, undoubtedly is, a still better would be welcomed. Trafalgar when grown and ripened in pots under identical conditions with those afforded Royal Sovereign carries more foliage than the latter, and pushes more flower spikes; in fact, its free bearing character amounts to a fault, which we rectify by freely pinching out the weakest spikes at an early stage of their development. The fruit is quite equal to Royal Sovereign in point of size, and in season of ripening it closely follows it, thus affording a good succession; but both in colour and flavour, though they are good, it cannot be said to equal Royal Sovereign. Its flesh is firm, and the fruit travels well. The plant is robust, and apparently capable of resisting attacks of mildew and red spider, which are attributes of much value. For outdoor culture Trafalgar is a prolific bearer, and yields very large fruits upon maiden plants. This is the only way we have grown it. In fact all our dessert fruit, with the exception of some produced by planting out forced plants, is grown in that way.

THE PEAR MIDGE.

THIS insect has of late years become very destructive in some districts, and nowhere more so than in the western counties, and those who have battled with it by doing their utmost by hand-picking the affected fruits and burning them have apparently derived little benefit therefrom, for the following season the attacks have proved to be as virulent as ever. In fact, the eradication of the insect in districts like this one, with very large Pear trees (where it is perfectly impracticable to hand-pick the midge-infested fruits), has become a perfectly hopeless task. It will be interesting, now that the Pear crop has been destroyed to a very great extent by the severe April frosts, to observe next season what effect it will have upon this insect. It is reasonable to suppose that its attacks will, to say the least, be diminished in a marked degree, and similar remarks apply to the codlin moth and some other pests. If this proves to be the case the destructive results of the elements, which many of us have serious reasons to bewail, will not be without good effect. Perhaps after all it is one of Nature's modes of remedying her own evils.

THOS. COOMBER.

The Hendre Gardens, Monmouth.

RENOVATING OLD VINES.

UNLESS root-pruning has been systematically practised the roots of Vines that have been planted some years will escape from the border they were meant to occupy. The Vine is naturally a deep-rooting plant, and unless in some way checked is sure, sooner or later, to thrust its roots down into the subsoil, where they are removed from the influence of warmth and air. Roots that bury themselves to a depth of 6 feet can never be so active as those that remain within a foot or two of the surface. As a fact, they cease then to make fibrous roots to any extent, simply travelling on without ramifying, and sooner or later coming into the wet cold subsoil. In the case of Vines that have been planted some twenty years it frequently happens that no traces of fibrous roots can be found within measurable distance of the surface. Some years ago I had some Hamburgs that had been over twenty years in place. I had to go down 2½ feet before I found any trace of roots, and the smallest of them were as large as a man's finger. Vines in this condition cannot bear good crops. It is impossible to get large bunches or well-finished berries from them, and in a damp cool summer they are sure to shank badly. There are, of course, exceptions to the rule; some old Vines, such as that at Hampton Court for instance, continue in a healthy, fruit-bearing condition, and their roots are far away from the surface. This can only happen, however, where the soil is exceptionally favourable and the drainage very free, and where there is a great depth of soil on a

sandy or gravelly bottom. The greater portion of vineries are, however, in low-lying situations, where there are not more than 3 feet or 4 feet of soil above the clay perhaps, or that can be relied on not to get water-logged when the Vines are at rest. Concreting the bottom to keep the roots from getting down was much practised some years ago, but I am rather doubtful as to whether the results were always good. The roots, of course, got down on the concrete, and in the course of time it was found that the soil became sour, the consequence being that the points of the roots decayed. As a fact, it does not take much to kill the younger roots of a Vine at rest; they are very sensitive to excess of moisture from the time active growth ceases. One of the best market growers I am acquainted with, and who has gained many prizes at our large exhibitions, makes a practice of annually going over his Colmans, Hamburgs, and Alicante, and stopping the roots in their downward progress. If this is done at an early stage in the life of the Vine the formation of fibrous roots will be encouraged near the surface, and the Vines later on will not come into the condition which necessitates drastic measures to restore them to health and vigour. Undoubtedly the best way is to lift the roots and replace them in fresh compost. It is surprising what may be done in this way in the course of a year or two. Some Vines in a private garden had been planted about forty years, and came into such a weak condition that they could scarcely produce any bunches, and were every season attacked by mildew. The roots had gone down so deep that they were difficult to find, scarcely any fibres being discovered. After the first year these Vines improved rapidly, and now bear good crops, mildew being little in evidence. Where Vines are so old and get into this condition, it is, I think, better to root them out and start with young ones, giving as much change of soil as possible; but on the part of many there is a natural reluctance to do away with Vines that in their time have borne good crops. As I have proved, it is possible to restore old Vines to a fair degree of vigour without lifting the whole of the roots. I have some Hamburgs on the back wall of a lean-to; they were planted about thirty years ago, and the greater portion of the roots have made their way across the path into a front border used for Tomatoes and Strawberries. It would be impossible to lift the roots without disturbing the wall that encloses the border, so I thought I would try another plan. I took the soil away from the old roots as far as I could get at them, both above and below, notched them here and there, and packed them round with peat. The old soil, to about a foot in depth, was replaced with nice free compost. In the course of the season roots were freely produced, the growth was much stronger, and the wood ripened well. In succeeding years there was much improvement in the yield and quality of the produce. I strongly recommend this method to those who may not be willing to lift the whole of the roots.

J. CORNHILL.

SOCIETIES.

HOLLAND HOUSE FLOWER SHOW.

HARDY TREES AND SHRUBS.

THIS aspect of the garden was well represented, several excellent groups being tastefully arranged, and contributing largely to the excellence of the general display.

Messrs. William Outbush and Son, Highgate and Barnet, made another of their unique exhibits of clipped trees, their group on this occasion containing some 200 specimens in green-painted tubs. Box and Yew were the chief shrubs used, though some splendid pyramids of Bay and Euonymus were also in evidence. As showing the comprehensive character of the shapes into which the shrubs were clipped it may be mentioned that swans and peacocks, tables, chairs, boats, dogs, jugs, churches, and birds on pyramids in various forms made a display for which this firm is now so famous.

From Mr. John Russell, Richmond, Surrey, came a superb group of tree Ivies, embracing no less than forty varieties, and representing some 500 plants of dwarf and standard forms. This group was a very novel one, and was also tastefully set up in crescent form. Conspicuous plants were *Hedera arborea flavescens*, *H. arborea canariensis aurea*, *H. palmata aurea*, *H. arborea Gold Cloud*, *H. arborea Glymii*, *H. digitata aurea*, *H. arborea Sheen Silver*, *H. Silver Queen*, and *H. elegantissima*. Trailing growths of other Ivies were worked in along the front and made a pleasing finish.

Messrs. John Waterer and Sons, Limited, Bagshot, had a handsome group of specimen shrubs in pots and tubs, also a pretty selection of *Acer*, *Rhododendrons*, and a grand lot of *Kalmias*, which made a very interesting display. Of the more noteworthy shrubs the following deserve mention: *Thuja Lobbi zebra*, *T. occidentalis aurea*, *Abies concolor* (very fine), *A. nordmanniana*, *Thujopsis borealis argentea variegata* (a beautiful plant), *Retinospora plumosa aurea*, *R. obtusa densa* (very pretty), *R. pisifera aurea*, *R. eriocoides*, *Taxus fastigiata aurea*, *T. baccata aurea*, *Cryptomeria japonica elegans*, and a pretty piece of *Silver Box*. *Kalmia latifolia* seedlings saw this fine flowering shrub represented in various tints of colour, and the plants were freely flowered. Although there were few *Rhododendrons*, they were very fresh and clean, the best plants being *Mrs. John Kelk*, *Sir Henry Mildmay*, *B. W. Elliott*, *Maggie Haywood*, and *Beauty of Bagshot*.

Messrs. W. Fromow and Sons, Sutton Court Nursery, Chislewick, W., arranged a very large semi-circular group of Japanese Maples and hardy shrubs. The arrangement of the group was pleasing, and included in it were many valuable plants. Among the Maples were *Acer palmatum dissectum atro-purpureum*, *A. p. roseum marginatum*, *A. p. dissectum variegatum*, *A. p. coralinum*, and others. *Retinospora leptocladia* and *R. squarrosa* were conspicuous. Bamboos and numerous delightful hardy trees and shrubs were much admired. A pretty lot of *Kalmia latifolia* were exhibited in baskets, and interspersed in the group pleasingly.

As usual, Messrs. J. Cheal and Son, Crawley, were well to the fore with a large and comprehensive group of ornamental trees and shrubs. The arrangement of the group left nothing to be desired. The different plants were quite artistically disposed, and charming contrasts thereby effected. Flowering plants were represented by *Kalmia latifolia*, *Veronica newryensis* (very fine), *Philadelphus*, *Hydrangea*, *Rhododendrons*, and other plants. Shrubs were seen in good condition as represented by *Thujopsis dolabrata*, *Cupressus lawsoniana* var., *Thuja japonica filiformis*, and *Retinospora plumosa aurea*. The foregoing are a mere tithe of the good things seen in this group.

By far the best group of ornamental trees and shrubs was displayed by Messrs. Thos. Cripps and Son, Tunbridge Wells, Kent. Exceptionally fine specimens of the better Japanese Maples were exhibited by this firm, and each one gave good evidence of the skill and ability of Messrs. Cripps as growers of these beautiful trees. The most striking specimen Maples were *Acer palmatum palmatifidum*, *A. p. dissectum*, *A. p. d. ornatum*, *A. p. septemlobum elegans purpureum*, *A. p. vitifolium* and the glorious *A. japonicum aureum*, *A. p. sanguinea*, *A. p. purpureum*, and numerous other lovely Maples which space prevents us from naming. *Vitis Coignetiae*, *V. heterophylla variegata*, *Cupressus macrocarpa Crippsii*, *Retinospora obtusa Crippsii*, and *Cupressus macrocarpa lutea* were noteworthy subjects, each of which had a charm of its own. In the centre of the group a magnificent specimen of *Retinospora obtusa Crippsii* was a prominent feature of this grand exhibit.

In association with a display of *Delphiniums* Messrs. James Veitch and Sons, Limited, Chelsea, S.W., arranged as a background a splendid lot of *Sciadopitys verticillata*. Each specimen was in a tub, and appeared to be in the pink of condition. We were much impressed with its value.

MISCELLANEOUS.

Messrs. William Wood and Son, Wood Green, N., exhibited garden statuary, both in iron and terra cotta. Messrs. Wood are exhibiting a new summer-house with revolving chamber at the top, whose advantages are obvious. Another summer-house is built on a raised platform, which is most useful on wet ground. Samples of artificial manure, insecticides, meteorological instruments, garden hose, lawn mowers, spraying instruments, syringes, &c., were also shown by Messrs. Wood and Son. One make of Messrs. Wood's, a hanging basket called "The King," has been supplied to His Majesty's yacht.

The Standard Manufacturing Company, Limited, Ye Olde Moot Hall, Derby, showed horticultural implements in variety, and particularly noticeable were the tree pruners in many different sizes and makes.

The Hull Chemical Works, Limited, showed Bitter Oil, a plant insecticide.

Messrs. Pulham and Son, 71, Newman Street, Oxford Street, W., exhibited garden vases, balustrades, &c., in "Pulhamite," the now well-known material for these purposes.

Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E., had an exhibit of Acme labels in various shapes and styles of lettering. These labels are practically imperishable, and to be highly recommended.

Messrs. D. Dowel and Son, Ravenscourt Avenue, Hammer-smith, W., exhibited an extensive display of Ohlendorff's Peruvian guano and manures, garden pottery, and sundries. "Junofloria," a preparation for preserving cut flowers in water, was exhibited by Junifloria Department, 95 and 96, High Holborn.

"Beetlecute," an infallible exterminator of beetles, cockroaches, ants, woodlice, &c., was shown by Messrs. Valls and Co., 16, Coleman Street, E.C.

Rural Table Decorations were shown by Mr. J. Williams, 4A, Oxford Road, Ealing, and Mr. Robert Sydenham, Tenby Street, Birmingham.

Some very attractive tubs for shrubs were sent by Messrs. Champion and Co., 115, City Road, E.C. They are in various forms and sizes, varnished, polished, and fitted with brass rims and handles.

Messrs. S. and E. Collier, Limited, exhibited garden vases and pottery.

The Pattison Patent Lawn Boots were shown by Mr. H. Pattison, 1, Farm Avenue, Streatham, S.W.

Mr. J. George, 14, Redgrave Road, Putney, S.W., had an exhibit of horticultural sundries, such as manures, insecticides, Mushroom spawn, peat, &c.

Munsted flower glasses from Messrs. James Green and Nephew, 107, Queen Victoria Street, E.C. (the manufacturers), made an interesting exhibit.

Messrs. Lee and Co., Knightbridge Street, Maidstone, exhibited fruit bottling appliances and outfits.

Messrs. William Poore and Co., American Stove Stores, 139, Cheapside, E.C., had a display of greenhouse and hall stoves, hot water apparatus, Beacon oil stove, paraffin oil stoves, &c.

Messrs. Eggett and Son, Thames Ditton, showed photographs of rockeries, alpineries, dripping wells, caves, &c., constructed by them.

Oak park fencing was shown by Mr. W. Bowen, timber merchant, Halesford, Sevenoaks, Kent.

The Economic Fencing Company, Limited, Billiter House, Billiter Street, E.C., showed the patent Feignon Unclimbable Chestnut Pale Fencing.

Mr. W. G. Parkin, 20, Oakdale Road, Sheffield, showed a patent pliable flower support, made of wire, and in the shape of a ball or an egg. This may be put in the neck of the vase or bowl.

Jadoo Limited, Palace Gate, Exeter, showed Jadoo fibre, Petersburg mats, new creeper wall clip, syringes, Jadoo liquid plant food, and other sundries.

Messrs. W. Herbert and Co., Hop Exchange, S.E., had a display of various garden requisites—for instance, leaf-mould, peat manures, Abol insecticide, &c.

Messrs. Osman and Co., 182 and 184, Commercial Street, E., exhibited a large collection of horticultural sundries. We noticed thermometers, prepared green raffia in various shades, flower vases, garden hose, garden cutlery, Osman's garden fertiliser, guano, weatherproof pencils for marking garden labels, punnets, Mushroom spawn, wood wool, &c.

NEW ORCHIDS.

First-class certificates were given to

Odontoglossum Rolfeae majesticum.—A large flower, with broad sepals and petals and fine oblong lip. The ground colour of this variety is white, and is heavily blotched with purple-red. From Messrs. Sander and Sons, St. Albans.

Mitonia vexillaria hindiana.—A beautiful flower, white, except for a faint tinge of purple on the sepals and in the centre of the flower. From Messrs. Sander and Sons.

Laelio-Cattleya Martinetti Plambeau.—The sepals and petals of this flower are deep rosy apricot, while the well-formed lip is rich purple. It is a flower of lovely and striking colouring. The parents are *Cattleya Mossiae* and *Laelia tenebrosa*. From Messrs. Sander and Sons.

Cattleya Mossiae Alexandra.—A large flower, with elegant pure white petals, sepals of the same colour, and a long lip of a beautiful pink-purple. The throat is rich yellow, this colouring extending towards the base of the lip. From Messrs. Sander and Sons.

Cattleya rochiana.—C. Mendell and C. hardyana are the parents of this hybrid *Cattleya*, which is of beautiful form. The white sepals and petals are tinged with purple, while the striking lip is of rich purple colour. From Messrs. Sander and Sons.

Cattleya Warneri alba.—A cultural commendation as well as an award of merit was given to a plant of this lovely *Cattleya*, which had one spike bearing five flowers. These are pure white except for the yellow throat. From M. A. A. Feeters, Bruxelles.

Awards of merit were given to

Odontoglossum ardensissimum Fascinator.—A pretty, symmetrical flower, with well-formed sepals and petals.

The ground colour of these is white, and both are blotched with red-purple. From Messrs. Sander and Sons.

Laelio-Cattleya Martinetti var. ochracea.—A large, spreading flower, with buff-yellow sepals and soft rosy buff petals. The long lip is rosy purple. *Laelia tenebrosa* and *Cattleya Mossiae* are the parents of this hybrid. From Messrs. Sander and Sons.

A cultural commendation was given to Mr. Denny, gardener to Sir William Marriott, Down House, Blandford, for *Disa* × *Clio* (*D. grandiflora* × *D. Veitchii*). The plants were very vigorous and blooming splendidly.

NEW PLANTS.

The following received a first-class certificate: *Lilium auratum platyphyllum Shirley* var.—This fine form was, without doubt, the most handsome hardy-flowering plant at this great show. The ordinary forms of *L. platyphyllum* are well known for their great stature and surpassing beauty, and this is the finest form we have seen. As adding to its greater value from the garden point of view we were informed that the whole of the stock had been raised at Shirley from a single bulb, a most encouraging fact. The plant is fully 6 feet high as shown, the giant white golden-banded flowers of great substance and beauty. From Messrs. Wallace and Co., Colchester.

The following received an award of merit: *Bremneria Mrs. Reuthe*.—This is the result of a cross between *E. turkestanica* and *E. Bungei*, with medium size flowers in a compact spike some 3 feet in length. The colour is a soft lemon-yellow, rather pale in tone. It is very charming. From Mr. G. Reuthe, Keaton, Kent.

Papaver nudicaule (for strain).—The award in this instance was given to a superior strain of these Iceland Poppies, a strain embracing many shades from cream into yellow and gold, and again to fiery orange-scarlet. Some very curious and interesting forms had flaked flowers, the petals distinctly barred with a shade of colour distinct from the body colour of the flower. From Messrs. Storrie and Storrie, Dundee.

Papaver orientale Lady Roope.—A splendid cupped form of an intense salmon-orange shade with a dark blotch of medium size on each petal. Very showy and pure in colour. From Mr. R. C. Notcutt.

Delphinium Monarch.—This variety has a good well-formed spike and dark purplish violet flowers with dark centre. A large and handsome flower. From Mr. R. C. Notcutt, Woodbridge, Suffolk.

Delphinium Rev. W. Wilks.—So far as the single blossoms are concerned, these are of great size and the spike of moderate proportions. The colour is intense purple. A splendid variety. Exhibited by Messrs. Kelway and Son, Langport.

Carnation Shiela.—A beautiful yellow ground fancy kind for the border, the petals freckled and bordered with dark crimson. From Messrs. Cutbush and Sons, Highgate.

Carnation Lady Walcott (Border).—A large and showy variety, salmon or deep rose-salmon in colour. The flowers are large, well formed, and sweetly scented. It is an excellent variety. Shown by Messrs. W. Cutbush and Sons, Highgate.

Peonia Dawn.—A very beautiful semi-double variety, with rich rosy red outer petals, the golden central tuft adding greatly to the attractiveness of this handsome variety. Exhibited by Messrs. Wallace and Co., Colchester.

Lilium Kelloggii.—A very beautiful species, with small, much reflexed flowers, the segments of which are of a rosy hue, freely covered with dark spots. The form of the flower with its size gives one an impression of *L. rubescens*. It is a pretty and dainty Lily. Shown by Messrs. Barr and Sons, Covent Garden.

Noctitana Sanderi.—This fine plant, described as a hybrid between *N. rubra* and *N. affinis*, may quite easily be taken at another season of the year for one of the *Calanthes* in respect to colour. Naturally in the present plant there is a much greater array of blossoms, but the rich rose-pink is a very beautiful and attractive shade in a plant so easily cultivated. If the plant comes true from seeds it will prove a most valuable addition to good garden plants. From Messrs. F. Sander and Sons, St. Albans.

Begonia The Queen.—A fine single variety, the flowers well formed, of a creamy white, touched with the palest salmon-pink. The centre is rich orange-yellow. Shown by Messrs. Laing and Sons, Forest Hill.

Begonia Countess of Warwick (Double).—In every respect a flower of high quality. The colour is rich yellow, heavily bordered with orange. From Messrs. Blackmore and Langdon, Twerton, Bath.

Begonia W. Sparshott.—A fine double-flowering variety, bright scarlet in colour, and remarkable for its substance of petal. From Messrs. B. R. Davis and Son, Yeovil.

Begonia Gipsy Girl.—A single and crested variety. The colour is white, with delicate pink shading. From Messrs. B. R. Davis and Son, Yeovil.

THE GLOUCESTERSHIRE AND CHELTENHAM SOCIETY.

AN excellent show was held by this society on the 24th ult. in the Montpelier Gardens, Cheltenham, which is a most desirable position for the purpose. The groups of plants were numerous and splendidly arranged, and cut flowers were in great perfection. Table decorations were also tastefully arranged, and altogether the show was a great success, reflecting much credit upon the officials.

PLANTS.

For ten greenhouse and stove-flowering plants three entered, of which Mr. Cypher, Exotic Nursery, Cheltenham, was a good first, and staged a collection of splendid plants, including *Stactea profusa*, *Allamanda nobilis*, *Bougainvillea Sanderi*, *Azalea Holfordii*, *Stephanotis floribunda*, *Ixora salicifolia*, and *I. Williamsii*; Mr. Vause of Leamington was second with smaller well-flowered plants.

For six plants, three flowering and three ornamental foliage, Mr. May, gardener to H. O. Lord, Esq., was first; Mr. Maddock, gardener to J. Horlick, Esq., Cowley Manor, second.

For twelve flowering plants in 6-inch pots, Mr. Mutlow, gardener to Major Percy Shewell, was first with small well-flowered plants, embracing some choice *Orobolids*, *Heaths*, and *Kalosanthes*; Mr. Maddock was second with an almost equal production; and Mr. May third. A class for six table-plants was well filled, the premier award being taken by Mr. Mutlow, who was closely followed by Mr. Maddock and Messrs. Pates and Sharp, The Nurseries, Cheltenham. Only two exhibitors staged in a class for six pots of *Lilium*, viz., Mr. May and Messrs. Pates and Sharp, who were placed in the order named.

GROUPS.

Miscellaneous plants arranged in 150 square feet. These always make a grand display at Cheltenham, and on this occasion there were four exhibitors, the chief of which was Mr. Cypher, who arranged a remarkably effective group; Mr. Vause was placed second.

In a corresponding class, confined to amateur exhibitors, Mr. Mutlow arranged the most effective collection of well-grown plants, while Mr. Maddock was placed second amongst four exhibitors. For

ORCHIDS

arranged in a space of 100 square feet, Mr. Cypher was far ahead of his rival, the Cheltenham group being the best feature in the show, and included many grand varieties of choice *Odontoglossums*, *Cattleyas*, *Laelias*, *Cypripediums*, *Oncidiums*, *Masdevallias*, &c., arranged upon a groundwork of Maidenhair Fern.

Tuberous *Begonias* were arranged in splendid condition, both by Messrs. Heath and Son, The Nurseries, Cheltenham, and Messrs. Pates and Sharp, each group being almost perfect.

PELARGONIUMS.

both show and zonal varieties, made effective features. With zonals Mr. Mutlow was the leading exhibitor, Mr. May second, and Messrs. Pates and Sharp third. The show varieties were best shown by Mr. May.

Gloxinias were also well shown in groups, Mr. May being placed first. With a group of Carnations Messrs. Heath and Son were a good first.

TABLE DECORATIONS.

There were four competitors in this class, Miss Watson taking the leading award, followed by Mr. Vause and Miss L. Nicholas, each arranging in a tasteful manner. Messrs. Pates and Sharp had the best bouquet.

ROSES.

For twenty-four blooms: Messrs. Townsend and Sons, Worcester, were the only exhibitors in this class, staging for the season an excellent lot of flowers. In the class for flowers arranged with their own foliage in a space 6 feet by 4 feet, there were two exhibitors, Messrs. Townsend and Son taking the lead with fifty-three varieties, splendidly staged and blended, Messrs. Pates and Sharp being second.

Messrs. Pates and Sharp were a good first with cut flowers and foliage arranged in a space of 6 feet by 4 feet. For a collection of cut flowers of herbaceous plants and hardy perennials, Messrs. Pates and Sharp were again first.

FRUIT.

Mr. Savory, gardener to the Rev. G. Coventry, was first with a fine collection of six dishes of fruit. Mr. Savory was also first for a dish of Strawberries with Royal Sovereign; Mr. Marsh with a dish of Peaches, and Mr. May for Nectarines.

VEGETABLES.

For a collection of eight varieties, Mr. F. Taylor, Ryefield Gardens, was placed first, while Messrs. Pates and Sharp were first with Tomatoes, and also with Cucumbers.

NON-COMPETITIVE EXHIBITS.

Mr. Cypher staged a large and effective group of Pelargoniums, and Mr. White, nurseryman, Worcester, brought an extensive and highly meritorious exhibit of herbaceous flowers.

ROYAL AGRICULTURAL SOCIETY'S EXHIBITION AT PARK ROYAL.

THE HORTICULTURAL DISPLAY.

EXCEPTIONAL interest attaches to the 1903 exhibition of this society, in so far that it is the first meeting held at its permanent home in London. Opinions are divided as to the wisdom of the policy of abandoning entirely the movable provincial exhibitions. Many practical agriculturists of wide experience and influence hold that if the society, instead of abandoning the provincial shows altogether, had reduced the number of places to be visited from seven to four of the most central and populous towns, success would have been assured, and the county agriculturists better pleased and more satisfied.

In the face of serious deficits in its funds, by which the society has been harassed and menaced of late years, the council had a most difficult and arduous task to perform, and we sincerely hope that complete success will yet crown their efforts.

Park Royal is situated on high commanding ground, between Ealing and Willesden, distant from each about two miles. New stations have been erected in close proximity, and a splendid service of trains established from all parts, the show being reached in about a quarter of an hour from Paddington, Euston, King's Cross, and

the District lines. The council are to be congratulated for having got together a show of such excellence and magnitude as to compare favourably with the best that have gone before. We were favourably impressed by the excellent way in which the positions of the different buildings and sheds for the accommodation of the exhibits had been arranged, a perfect modern town it seemed, with wide and long avenues between the buildings; avenues, however, without trees. These, we hope, will be forthcoming before another year comes round. Trees would add immensely to the attractiveness and beauty of the ground, besides affording pleasant shade from a broiling sun such as we are now experiencing. Not the least interesting parts of this great show are the annexes devoted to showing the produce of the earth in the way of cereals, roots, fruits, vegetables, and flowers. So enterprising and ambitious are our great seed merchants that these structures now assume at our agricultural shows quite a palatial appearance, and the attractive and beautiful way in which the contents are arranged reflect the greatest credit on the firms represented, and, judging by the crowds of people by which they were visited, this section of the exhibition was certainly one of the most popular and best patronised.

Messrs. Sutton and Sons' Establishment is immediately on our right as we enter, and, needless to say, by the quality and variety of the exhibits, and by the artistic and attractive way in which they were disposed, the stamp of excellence which characterises all this firm does was apparent here. The leading exhibits, of course, appertained to agriculture more than to horticulture, but the two had been so well blended together in the arrangement as to present one beautiful and harmonious whole. The collection of Peas in pots loaded with well filled pods, seemed most to take the fancy of the country folk, no doubt in their minds conjuring up visions of young ducks and green Peas. The Tomatoes in pots were very fine, and included all their well known popular sorts. Gloxinias and other florist and garden flowers, for which they are celebrated, were there in great profusion, a miniature of their Temple show exhibit in fact.

Messrs. Carter of Holborn, the Royal seed merchants, were well represented, having magnificent exhibits of roots, corn, fruit, and flowers, all interesting and beautifully arranged.

Messrs. Dickson of Chester.—This firm is always well to the fore at all our great agricultural shows, and for variety and quality of exhibit and in the manner of arrangement nothing could have been better than their stand at this show.

Messrs. Webb and Sons of Stourbridge were, as usual, strongly represented, having an immense stand, all replete with the best of everything in season, whether of seeds, fruit, vegetables, or flowers.

Messrs. Dickson, Brown, and Tait.—This Manchester firm by its exhibit did credit to its reputation and to the city and county from which it hails.

Messrs. Dickson and Robinson, also of Manchester, were well represented in all the departments of their immense business, showing produce of the highest quality.

Messrs. Harrison of Leicester.—This well-known Midland firm had a most attractive stand filled with the highest quality produce.

THE TEMPLE ROSE SHOW.

THE National Rose Society held its great exhibition in the Temple Gardens on Wednesday last. Considering the bad weather that has been experienced the display may be said to have been very satisfactory, but that is not saying that it was a really good one. There were numerous good Roses in the show, although many of them were small; the heat of the tents was felt no less by the Roses than by the visitors. The latter appeared not to be very numerous. Messrs. Harkness and Co.'s exhibit that won the first prize for seventy-two blooms contained many good flowers, and in the other first prize stands

there were some splendid blooms, but generally speaking the Temple Rose show was not so good as one could have wished, although, as we said before, this must be qualified by the remark that considering the bad season it was better than expected. No new Rose gained a gold medal.

NURSERYMEN.

Seventy-two blooms, distinct varieties: First, Messrs. R. Harkness and Co., Hitchin, with a very bright lot indeed, the coloured varieties were particularly good. Among these the best were Grand Mogul, Prince Arthur, Dupuy Jamain, E.Y. Teas, Gustave Piganeau, Suzanne Marie Rhodocanashi, and Mme. Housman. The best pale coloured blooms were Mrs. Edward Mawley, Bessie Brown, Cleopatra, White Maman Cochet, Boadicea, Clara Watson, Souvenir de Pierre Notting, Frau Karl Druschki, Lady Fitzwilliam, and Marchioness of Londonderry. Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, were second, with an exhibit that had many good blooms, Medea, Empress Alexandra, White Lady, Papa Lambert, Bessie Brown, and Marie Corelli were of the best; Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester, were third. Antoine Rivoire, Mildred Grant, and Souvenir de Pierre Notting were good blooms.

Forty distinct varieties, three blooms of each: First, Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, with some lovely flowers, particularly of Mildred Grant, Countess of Caledon, Mrs. W. J. Grant, Helen Keller, A. K. Williams, Bessie Brown, Empress Alexandra, Medea, and La France; second, Messrs. Alexander Dickson and Sons, Limited, Newtownards, County Down, with, on the whole, smaller blooms and hardly so fresh. Mildred Grant, Mrs. W. J. Grant, Bessie Brown, Marquise Litta, White Lady, and Ulster were of the best. Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester, were third, Mildred Grant, Souvenir de Pierre Notting, Caroline Testout, and Robert Scott were the best.

Forty-eight blooms, distinct: First, Messrs. G. and W. Burch, Peterborough, with a somewhat uneven stand that contained numerous good blooms. Among them were Luciole, La France, Comte Raimbaud, Lady Fitzwilliam, Mrs. Edward Mawley, Mr. John Laing, Her Majesty, Souvenir de President Carnot, and Mme. Gabrielle Luizet. Mr. Hugh Dickson, Belfast, was a very good second. His stand contained very good blooms of Gustave Piganeau, Frau Karl Druschki, La Fraicheur, Duchess of Abercorn (new), Ulster, Countess of Caledon, and La France. Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, were third. Mildred Grant and Mrs. Edward Mawley were excellent blooms.

Twenty-four blooms, distinct: First, Mr. George Mount, Canterbury, with good flowers, notably of Mrs. W. J. Grant, Prince Arthur, Caroline Testout, La France (splendid), Lady Fitzwilliam, and Mildred Grant. Second, Mr. Charles Turner, Royal Nurseries, Slough. Mrs. E. Mawley, Ulster, Mrs. J. Laing, and Killarney were all good. Third, Mr. Thomas Rigg, Caversham, Reading. La France and Mrs. W. J. Grant were the best blooms.

Twenty-four varieties, three blooms of each: First, Mr. Charles Turner, Slough, with flowers of good form and fair size. Ulster, Tom Wood, La France, and Mrs. John Laing were the best. Mr. George Mount, Canterbury, was second with less regular blooms, of which Lady Mary Fitzwilliam, White Lady, Margaret Dickson, and Liberty were the best. The third prize was won by Mr. Hugh Dickson, The Nurseries, Belfast. E.Y. Teas, Marquise Litta, and Mrs. J. Laing were very good.

TEAS AND NOISETTES.

Twenty-four blooms, distinct: First, Mr. George Prince, Longworth, Berks, with some beautiful blooms though some were small. Mrs. E. Mawley was a magnificent flower, and Comtesse de Nadaillac, Mme. Hoste, Muriel Graham, The Bride, and Empress of Russia were very good. Messrs. D. Prior and Son, Colchester, were a good second. Mrs. Edward Mawley, The Bride, Caroline Kuster, Cleopatra, and Innocente Pirola were all good. Third, Messrs. Frank Cant and Co., whose exhibit

contained a splendid bloom of Mrs. Edward Mawley.

Twelve blooms, distinct: First, Messrs. J. Burrell, Howe House Nurseries, Cambridge, with rather small flowers. The best were Mrs. Edward Mawley, Souv. de Pierre Notting, Lady Roberts, and Empress Alexandra; second, Mr. John Mattock, New Headington, Oxford. Mme. Hoste, Medea, and Cornelia Kock were very good blooms.

Fourteen distinct varieties, three blooms of each in vases: First, Messrs. D. Prior and Son, Colchester, with Marie van Houtte, Maman Cochet, Mrs. Edward Mawley, Anna Olivier, and Souv. de S. A. Prince as the best; second, Mr. George Prince, Longworth, Berks, Mrs. E. Mawley, Medea and Bridesmaid being splendid.

EXHIBITION ROSES IN VASES.

Twelve distinct varieties, seven blooms of each in vases: First, Mr. George Mount, Canterbury, with a very good exhibit. Mrs. Sharman Crawford, Mrs. W. J. Grant, Ulrich Brunner, Liberty, Mrs. J. Laing, and Caroline Testout were very fine; second, Mr. George Prince, Longworth, with rather smaller blooms, of which Mrs. S. Crawford, Bessie Brown, and Anna Olivier were best; third, Messrs. R. Harkness and Co., Hitchin, Herts, with some very good blooms.

Nine distinct varieties of Teas and Noisettes, seven blooms of each, in vases; Mr. Prince, who won first prize, was the only exhibitor, Mrs. E. Mawley was splendidly shown.

GARDEN ROSES.

Thirty-six distinct varieties, three trusses of each: First, Messrs. Paul and Son, the Old Nurseries, Cheshunt, with a beautiful lot, good blooms, well arranged in vases. Mme. Abel Chateau, Dawn (H.T.), W. A. Richardson, Macrantha, Leonie Lamesch, Una, Camens, and Mme. Pernet Ducher were of the best; second, Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester, who also showed some good bunches. Souv. de C. Guillot, Camens, Mme. Rene Gerard, Mme. Louise Poncet, Mme. d'Arblay, Rainbow, and Killarney were of the best. Messrs. George Cooling and Sons, Bath, were third. Soleil d'Or and Moschata Nivea were very attractive.

Eighteen bunches: First, Mr. George Prince, Longworth, Berks, with some lovely flowers. Belle-fleur (new H.P.), W. A. Richardson, Papillon, and Purity were among the best. Mr. Charles Turner was second. His best bunches were Mme. Charles, Flora McIvor, Mme. Falcot, Mme. A. Chateau, and Mme. P. Ducher.

Eighteen distinct varieties of summer-flowering Roses (H.P.'s, H.T.'s, Teas and Chinas excluded): First, Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester. Maiden's Blush, Myrianthes, Persian Yellow (lovely), The Lion (single), Red Provence, Rosa Mundi, Red Damask, and The Wallflower were included. Second, Messrs. Paul and Son, Cheshunt. Their best bunches were of Anne of Geierstein, Striped Provence, Moss Julie de Mersan, Reine Blanche (single), Cabbage, and Old Red Damask. Third, Messrs. George Cooling and Sons, Bath.

ROSES IN POTS.

Mr. Charles Turner was first for a group of Roses in pots (150 square feet). It included standards of S. de Pierre Notting, Reine André, Alberic Barbier, Paul Transon, bushes of Queen Alexandra, and dwarf plants in variety. There were no more exhibits in this class.

OPEN CLASSES.

Twelve Hybrid Teas: First, Messrs. D. Prior and Son, Colchester, with some lovely blooms. Bessie Brown, Lady Mary Fitzwilliam, and Mildred Grant were the best. Second, Messrs. Alex. Dickson and Sons, Limited, Newtownards, with beautiful Mildred Grant and Alice Lindsell. Third, Messrs. Frank Cant and Co.

Twelve blooms (any white or yellow) in vase: First, Messrs. Alex. Dickson and Sons, with a splendid vaseful of Bessie Brown. Second, Mr. John Mattock, New Headington, Oxford, with good Medea.

Twelve blooms (any other than white or yellow) in vase: First, Messrs. Alex. Dickson and Sons, Newtownards, with a vase of Mrs. W. J. Grant.

Second, Mr. Charles Turner, with Mrs. J. Laing, both exhibits being splendid. Third, Mr. G. Mount.

Nine blooms of any new Rose: First, Messrs. Alex. Dickson and Sons, Newtownards, with Mildred Grant, a very good exhibit. Second, Messrs. George Bunyard and Co., Maidstone, with Robert Scott, pink, almost salmon-pink. Third, Messrs. Benj. R. Cant and Sons, Old Rose Gardens, Colchester, with a lovely lot of Frau Karl Druschki. Twelve blooms of new Roses, offered in 1900 and subsequently: First, Messrs. Benj. R. Cant and Sons, Old Rose Gardens, Colchester, with an exhibit that included Souv. de Pierre Notting, Robert Scott, William Askew, Mildred Grant, and Perle von Godesberg. Second, Messrs. Paul and Son, Cheshunt. Souv. de Pierre Notting, David Harum (lovely flesh-pink), Mildred Grant, and Prince de Bulgarie were of the best.

NEW SEEDLING ROSES.

Not less than three trusses of any new seedling Rose or distinct sport. A Card of Commendation was given to each of the following:

Blush Rambler.—From Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, a very free flowering Polyantha Rose, with Apple blossom-coloured flowers.

Climbing Rose Maharajah.—This is a seedling H.P. pillar Rose, with very large, single, rich crimson blooms, and will doubtless prove very effective upon a pillar. Some of the blooms measured 5 inches across. Evidently a vigorous grower. From Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester.

Mme. Levasseur.—This, which is much like a very dwarf Crimson Rambler, has been described on previous occasions. Shown by Mr. W. J. Wood, Swatling, Southampton.

Mrs. O. G. Orpen.—A new seedling Damask Rose, with large, rich pink blooms; the stamens are numerous, and add to the attractiveness of the flower.

DECORATIVE CLASSES.

Arch, decorated with long sprays of climbing Roses: First, Messrs. Paul and Son, who showed the variety Tea Rambler, with good-sized, semi-double pink flowers; second, Mr. George Prince, Longworth, Berks, with climbing White Pet; third, Mr. John Mattock, New Headington, Oxford.

Twelve single Roses, distinct: First, Messrs. George Cooling and Sons, Bath, with good bunches of Austrian Yellow Briar, Crimson Bedder, Leuchstern, The Lion, moschata alba, and others; second, Messrs. Paul and Son, Cheshunt. Paul's Carmine Pillar and Paul's Single White were fine.

Nine distinct Roses, suitable for buttonholes: First, Mr. George Prince, Longworth, Berks, with Marie Van Houtte, Papillon, Souvenir de J. B. Guillot, and others; second, Mr. John Mattock, New Headington.

Three sprays of Roses: First, Mr. Mattock; second, Mr. George Mount; third, Miss Jessie Langton, Raymead, Hendon.

AMATEURS.

Thirty-six blooms, distinct: First prize and the National Rose Society's champion challenge trophy, E. B. Lindsell, Esq., Bearton, Hitchin. White Lady, Ulster, Lady Fitzwilliam, Mrs. Grant, Mrs. John Laing, Innocente Pirola, and La France were of the best. The blooms of Mrs. John Laing in this stand won the silver medal for the best Rose other than H.T., Tea, or Noisette. Second, O. G. Orpen, Esq., West Bergholt, Colchester, with smaller blooms. Cleopatra, Bessie Brown, Mildred Grant, The Bride, and Medea were of the best. Third, Conway Jones, Esq., Huclecote, Gloucester, with very fresh flowers, though small.

Twenty-four blooms, distinct: First, A. Tate, Esq., Downside, Leatherhead, with excellent White Lady, Mrs. Edward Mawley, Kaiserin Augusta Victoria, and La France. Second, T. B. Gabriel, Esq., Hart Hill, St. John's, Woking. His blooms were small, though of good form. Souvenir d'Elise Vardon was a lovely flower. Third, E. M. Eversfield, Esq., Dene Park, Horsham.

Twenty-four blooms, distinct (another class): First, E. B. Lindsell, Esq., Bearton, Hitchin.

Mrs. Grant, Lady Mary Fitzwilliam, Kaiserin Augusta Victoria, and Mrs. Laing were the best of a very good box. O. G. Orpen, Esq., was second with a somewhat uneven display, and C. B. Haywood, Esq., Woodhatch, Reigate, was third with large and rather coarse blooms.

Twelve distinct varieties, three blooms of each: First, E. B. Lindsell, Esq. Mrs. Grant, Marquise Litta, and K. A. Victoria were splendid. Second, C. B. Haywood, Esq., Reigate. Margaret Dickson, Caroline Testout, and Mme. Gabrielle Luizet were the best. Conway Jones, Esq., Huclecote, Gloucester, was third.

Nine blooms of any Rose except Tea or Noisette in vase: First, Rev. J. H. Pemberton, with a splendid vaseful of Caroline Testout. Second, C. B. Haywood, Esq., with Mrs. John Laing.

GROWERS OF LESS THAN 2,000 PLANTS.

Twenty-four blooms, distinct: First, R. E. West, Esq., Reigate. La France No. 2 was the best bloom of a fairly good exhibit. Second, W. C. Romaine, Esq., The Priory, Old Windsor. Dupuy Jamin, Niphetos, and Innocente Pirola were the best. Third, E. M. Eversfield, Esq., Denne Park, Horsham.

Eight distinct varieties, three blooms of each: First, E. M. Eversfield, Esq. Ulrich Brunner, Mme. G. Luizet, and Bessie Brown were the best. Second, W. C. Romaine, Esq., Old Windsor, with Maréchal Niel, very good.

Seven blooms of any Rose except Tea or Noisette in vase: First, W. C. Romaine, Esq., Old Windsor, with a lovely vase of Jeannie Dickson. Second, E. M. Eversfield, Esq., with Mrs. John Laing. Third, Rev. Hugh A. Berners, Harkstead Rectory, Ipswich, with Mme. Abel Chatenay.

OPEN TO GROWERS OF LESS THAN 1,000 PLANTS.

Twelve blooms, distinct: First, C. B. Gabriel, Esq., Hart Hill, St. John's, Woking, with very good blooms, Lady Mary Fitzwilliam, La France, and Bessie Brown were the best; second, George Moules, Esq., Hitchin, Frau Karl Druschki was very good; third, Ernest Wilkins, Esq., Roeddale, Sidcup.

Five blooms (except Tea or Noisette): First, G. H. Baxter, Esq., Hutton Park, Brentwood, with Marquise Litta; second, F. R. Curtis, Esq., Wormingford; third, Ernest Wilkins, Esq.

GROWERS OF LESS THAN 500 PLANTS.

Nine blooms, distinct: First, Courtney Page, Esq., Earlsdown, Enfield, with a beautiful lot, Bessie Brown, Mrs. W. J. Grant, and Tennyson were excellent; second, J. J. Thompson, Esq., Bounds Green, N., with beautiful Caroline Testout; third, Mrs. E. A. Moulton, Stevenage, with very good White Maman Cochet. There were numerous other exhibitors in this class.

Six blooms, distinct: First, Dr. T. E. Pallett, Eden House, Earl's Coln, Essex, with beautiful K. A. Victoria, Mme. Hoste, and others. Second, A. C. Turner, Esq., Tatton, Edgware. Mrs. Grant being the best. Third, F. H. Leslie, Esq., Epcomb, Hertford. Medea and Innocente Pirola were the best.

Five blooms (Tea or Noisette excepted) in vase: First, R. W. Bowyer, Esq., Hertford Heath, Hertford, with Mrs. W. J. Grant. Second, The Rev. F. J. Fulford, Flaxley Vicarage, Gloucester, with La France. Third, A. C. Turner, Esq.

GROWERS OF LESS THAN 200 PLANTS.

Six blooms, distinct: First, Miss Alice M. Lucas, Hitchin; second, Dr. Ernest Maltby, Feltham, Middlesex; third, Miss Ethel M. Wightman, Bengoe, Herts.

EXTRA CLASSES.

Twelve blooms, distinct: First, Mrs. J. E. Times, Bedford Road, Hitchin, Herts, with a lovely boxful. White Lady, K. A. Victoria, and Mrs. Laing were of the best. This exhibit won the challenge cup offered to growers of less than 1,000 plants. Second, George Moules, Esq., Hitchin, Herts. La France and Ulster were excellent.

Four distinct varieties, three blooms of each: First, William Kingston, Esq., with Caroline Testout, the best; second, Ernest Wilkins, Esq.; third, G. H. Baxter, Esq., Brentwood.

The Ramsay Cup, given for twelve blooms,

distinct, was won by Alfred Tate, Esq., Downside, Leatherhead, with some very good blooms. Maman Cochet, Muriel Grahame, K. A. Victoria, and White Maman Cochet were the best. This exhibit contained the best Tea or Noisette (Muriel Grahame), and also the best Hybrid Tea (Bessie Brown); second, A. Hill Gray, Esq., Beaulieu, Newbridge, Bath, with Mildred Grant, Catherine Mermet, and others very good; third, Rev. J. H. Pemberton.

Six blooms (open to those who have never won a prize at the National Rose Society's show): First, Dr. T. E. Pallett, Earl's Coln, Essex. Bessie Brown was a very good bloom. Second, E. Percy Sugden, Esq., Winchmore Hill, N., Maman Cochet and Mme. A. Chatenay being the best. Third, the Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead.

Six blooms (in four varieties): First, A. E. Farnden, Esq., Sutton; second, W. R. Hammond, Esq., Burgess Hill, Sussex; third, Miss Du Berisson, Tanfield, W. Clendon.

Six blooms, distinct: First, Hammond T. Hinton, Esq., Heytesbury, Wilts; second, Mrs. Ethel M. Wightman, Bengoe, Herts; third, R. F. Lambe, Esq., Burgess Hill.

Six blooms (grown within eight miles of Charing Cross): The challenge cup was won by J. T. Thompson, Esq., Bound's Green, N. Mrs. J. Laing and Caroline Testout were very good. Second, W. G. Adcock, Esq., Torrington Park, N. Third, E. R. Smith, Esq., Muswell Hill.

Six blooms of new Roses: Second, Rev. J. H. Pemberton. Frau Karl Druschki was the best. Second, G. W. Cook, Esq., Wood Glen, Muswell Hill, N. La Tosca was the best bloom.

TEAS AND NOISSETTES.

Eighteen blooms, distinct: The National Rose Society's Tea and Noisette Challenge Trophy was won by A. Hill Gray, Esq., Bath, with some grand blooms of Medea, Catherine Mermet, Mrs. E. Mawley, Mme. Hoste, and others; second, Rev. F. R. Burnside, Great Stambidge Rectory. Mrs. E. Mawley, Sylph, and Innocente Pirola were the best. Third, O. G. Orpen, Esq.

Eighteen blooms, distinct: The Cocker Challenge Cup was won by the Rev. F. R. Burnside, Great Stambidge Rectory, with Sylph, Mrs. E. Mawley, The Bride, and others, very good; second, A. Hill Gray, Esq.; third, C. B. Hayward, Esq.

Eight varieties, three blooms of each: First, A. Hill Gray, Esq., Bath, with Mrs. E. Mawley splendidly shown. Bridesmaid also. Second, Rev. F. R. Burnside. Third, O. G. Orpen, Esq.

Seven blooms of one variety in vase: First, Rev. F. R. Burnside with beautiful White Maman Cochet; second, A. Hill Gray, Esq., with Medea; third, E. M. Eversfield, Esq.

GROWERS OF LESS THAN 500 PLANTS.

Twelve blooms, distinct: First, J. B. Gabriel, Esq., with some good blooms, notably Golden Gate and Muriel Grahame. Second, G. Whittle, Esq., Belgrave Avenue, Leicester. Medea was splendid. Third, R. Foley Hobbs, Esq., Thornelee, Worcester.

GROWERS OF LESS THAN 200 PLANTS.

Nine blooms, distinct: First, G. H. Baxter, Esq., Brentwood; a good second, Arthur Munt, Esq., Hedgerley, Slough; third, F. R. Curtis, Esq.

Six blooms, distinct: First, W. R. Hammond, Esq., with very good flowers; second, R. W. Bowyer, Esq.; third, A. C. Turner, Esq.

The prizes, which were on view, were supplied by the Goldsmiths' and Silversmiths' Company.

Extra classes for amateurs in the Tea and Noisette section included one for four distinct varieties, three blooms of each. The prizes in this class were offered by Mr. George Prince. The piece of plate, of the value of £3 3s., for first prize was won by Alfred Slaughter, Jarvis Villa, Steyning, with a very pretty series, Mrs. E. Mawley, Maman Cochet, and Muriel Graham being in good form. Second prize was awarded to the Rev. F. J. Fulford, Flaxley Vicarage, Gloucester, the trio of Maman Cochet being very fine. The third stand was disqualified.

Five blooms (one variety) in vase: First, G. H. Barter, Esq., with *Medea*; second, Rev. F. J. Fulford, also with *Medea*; third, R. W. Bowyer, Esq., with *Anna Olivier*.

Five entries for six blooms in not less than three varieties, open to amateurs who have never won a prize at any of the society's shows before, made an interesting display. First prize, a piece of plate offered by Messrs. R. H. Bath, Limited, Wisbech, for leading honours was won by H. Clinton Baker, Esq., Bayfordbury, Hertford, with a nice and even box of blooms. *Cleopatra*, Mme. de Watteville, and Mme. Hoste were good. Second prize was won by the Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, and third prize was secured by Mrs. H. Anne Sivewright, The Rise, Oxford.

EXHIBITION ROSES IN VASES.

The class for nine vases, five blooms in each, was empty, and but one entry was forthcoming in Class 59 for six distinct varieties of *Teas* and *Noisettes*, seven blooms in each. In this instance A. Hill Gray, Esq., Beaulieu, Newbridge, Bath, was placed first with a very pretty set, showing a light and easy style of arrangement. *Bridesmaid*, Mme. Cusin, Anna Olivier, and The Bride were his best varieties. The piece of plate awarded as first prize was offered by R. E. West, Esq.

Class 60, for five distinct varieties, five blooms of each, found only one exhibitor. The first prize was awarded, although the general opinion appeared to be that this exhibit was very generously considered. The piece of plate, value two guineas, offered by Mr. Will Taylor, Hampton, was awarded to Miss Beatrice H. Langton.

DECORATIVE SECTION FOR LADIES ONLY.

Seven charming tables competed in the class for a decoration of cut *Roses* for dinner table, arranged with any cut foliage, Ferns, or grasses.

A lovely arrangement of large- and medium-sized single *Roses* of white and blush-tinted sorts won first prize for Mrs. O. G. Orpen, West Bergholt, Colchester. The flowers, however, were rather too crowded, and the general opinion was the arrangement was too "squat." Otherwise it was a charming exhibit. Mrs. Holland, Silverdale Grange Road, Sutton, was placed second, also with a beautiful arrangement of pink and rose-pink *Tea Roses* of good quality. This was a lovely piece of colour, but lost points for want of *Rose* foliage, of which there was absolutely none. *Selaginella* trailing growths were pretty. Third prize was won by Miss Jessie B. Langton, Raymond, Hendon, with pretty rose-pink single *Roses* and rather too much greenery. Fourth prize was secured by Miss A. F. Harwood, 16, St. Peter's Street, Colchester, whose exhibit deserved a better position. The first prize, a piece of plate, value five guineas, was offered by Mr. Charles Turner, Slough, and the second and third prizes by A. Tate, Esq.

Nine exhibits of a bowl of *Roses* made a brave display. In this instance Miss Jessie B. Langton was placed first, with a bold arrangement of charming blush single sort. Mrs. O. G. Orpen again scored with a deep rose-coloured arrangement, clusters of small singles contrasting with large blooms. A very handsome bowl of coppery *Tea Roses* won third prize for Miss A. F. Harwood; this needed better setting up. The prizes in this class were offered by T. B. Gabriel, Esq.

The class for a vase of cut *Roses* brought out even competitors, Mrs. Edward Mawley, Great Berkhamstead, was placed first with a lovely vase of Mrs. W. J. Grant, buds and large blooms being pleasingly associated. Miss Jessie B. Langton was second, with a very handsome vase of cream-coloured *Tea Roses*, and Miss Harwood third with *La France*. Messrs. G. Bunyard and Co., Maidstone, offered a piece of plate value £2 2s. this competition as first prize.

Five entries in the class for a basket of *Roses* made a welcome change. First prize, a piece of plate, offered by Mr. John Mattock, Oxford, and valued at £2 2s., was won quite easily by Mrs. Orpen. This was a bold and handsome arrangement. Lovely blooms of the sweet-scented class were charmingly associated. Equal second prize,

were awarded respectively to Miss Harwood and Miss Jessie B. Langton, each with an interesting exhibit.

GARDEN OR DECORATIVE ROSES.

The class for eighteen bunches, garden or decorative *Roses*, was represented by two exhibits only, but they were superbly fine. The first prize was well won by Alfred Tate, Esq., Downside, Leatherhead. His bunches were large and bold, of beautiful colour, and nicely disposed. *Lady Battersea*, Irish Glory, Cecile Brunner, *Macrantha*, *Gustave Regis*, W. A. Richardson, *Rosa Mundi*, and *Augustine Guinoisseau* were well shown. The Rev. Joseph H. Pemberton, Havering-atte-Bower, Essex, was placed second with a charming series. *Reine Olga de Wurtemberg*, Mme. Alfred Carrière, Paul's *Carmine Pillar*, Anne of Geierstein, and *Lady Curzon* were his best bunches. Miss Willmott, V.M.H., gave the first prize—a piece of plate—in this class.

There were only two exhibitors in the class for twelve bunches of garden *Roses*. Mrs. A. F. Perkins, Oak Dene, Holmwood, Surrey, was an easy first with rather tightly arranged bunches of good sorts. Conspicuous were Dr. *Rouges*, *Macrantha*, *Marquis of Salisbury*, Mme. Chedane *Guinoisseau*, and *Camoens*. The second prize was awarded to the Rev. F. J. Fulford, who had an interesting series of bunches. The first prize—a piece of plate value £5 5s.—was presented by the Girdlestone Memorial Fund.

Six lovely exhibits in the class for six bunches of garden *Roses* found A. C. Turner, Esq., Tatton, Edgware, first, with a superb lot. Mme. Eugène Rosal, Isabella Sprunt, W. A. Richardson, *Marquis of Salisbury*, *Camoens*, and Mme. Chedane *Guinoisseau* were the varieties exhibited. E. Mawley, Esq., was second with a pretty exhibit, and G. W. Cook, Esq., Woodside, Muswell Hill, N., was a good third. The last exhibit contained some superb bunches. The first prize was a piece of plate offered by O. G. Orpen, Esq.

Six bunches of buttonhole *Roses*: First, O. G. Orpen, Esq., with a pretty and interesting lot of flowers, *Ma Capucine*, Mme. Hoste, and *Anna Olivier* being fine. A. C. Turner, Esq., was second also with a pretty exhibit.

Five distinct varieties of garden *Roses*, three sprays of each, were also interesting. Mr. R. Sydenham's piece of plate, value £5 5s., was won by O. G. Orpen, Esq., second prize by Rev. J. H. Pemberton, and third prize by Miss Beatrice Langton.

NON-COMPETITIVE.

Messrs. W. Cutbush and Sons, Highgate, N., exhibited an attractive group of *Malmaison* and *Tree Carnations*, arranged with *Lantanas*, *Marguerite Coronation*, *Verbenas* Ellen Willmott, &c. Among the *Malmaisons* were *Churchwarden*, *scarlet*; *Nautilus*, flesh colour; *Baldwin*, rich rose; *Florizel*, red rose; and *Grace*, large rich pink. Of border *Carnations* there were *Ruby*, pretty cerise-red; *Herbert J. Cutbush*, bright red; *King Ulher*, maroon-red; *Prince of Orange*, buff and red; *Lady Wolverton*, salmon-red.

Messrs. Cannell and Sons, Swanley, Kent, showed a brilliant lot of *Cannas* in several good varieties. The plants were well bloomed, and growing in small pots.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had an exhibit of *Oroids* that included *Cattleya gaskelliana splendens*, *Lelio-Cattleya canhamiana*, *Cattleya intermedia alba*, *C. Mossiae Lowi*, *Lælia Iona*, *Cypripedium gigas Cordeani*, and several *Odontoglossums*.

Messrs. R. Wallace and Co., Colchester, exhibited an interesting display of hardy flowers, including *Iris Monnierii*, *I. intermedia*, and *I. gigantea*, all large-growing sorts; *Lilium excelsum*, *L. Martagon dalmaticum*, *L. M. album*, *L. Dalhousoni*, *L. auratum rubro-vittatum*, *L. tigrinum splendens*, *L. Henryi*, as well as *L. umbellatum* varieties. *Ixias* in many brilliant colours, *Gazania Trinacria*, *Heuchera micrantha rosea*, *Gillenia trifoliata*, *Canterbury Bells*, *Brodiaea laxa*, *Calochorti*, and Japanese *Irises* were also largely shown in this bright display.

Messrs. Dobbie and Co., Rothessay, N.B., had a pretty exhibit of *Pansies* and *Violas* attractively

arranged in sprays, and also on exhibition boards. Some lovely varieties were among them.

The *Munstead* flower glasses, in natural and green-tinted glass, were shown by Messrs. James Green and Nephew, 107, Queen Victoria Street, E.C.

The well-known and very useful *Acme* labels were shown by Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E.

Messrs. W. Spooner and Son, Arthur's Bridge Nursery, Woking, had a pretty display of *Roses* in bunches, and single blooms also. The latter were at the back and at each end of the exhibit, and comprised such as *Electra*, *Carmine Pillar*, *Lady Penzance*, *Perle des Jardins*, *Souv. de Catherine Guillot*, *Gustave Regis*, W. A. Richardson, *Maman Cochet*, and *Cheshunt Scarlet*.

Messrs. George Bunyard and Co., Maidstone, showed *Roses* in bunches, and also boxes of single flowers. Among the former were *Killarney*, Mme. Hoste, *Macrantha*, *Homère*, *Leonie Lamesch*, *Amazon*, *Austrian Copper*, and of the latter *Prince Arthur*, *Ulster*, *La France*, *Margaret Dickson*, and *Antoine Rivoire* were good.

Mr. George Mount, Canterbury, had an excellent display of *Roses* in vases. Particularly good were *Caroline Testout*, *La France*, Mrs. John Laing, *Ulrich Brunner*, Mme. Hoste, *Margaret Dickson*, Mrs. W. J. Grant, and others. The flowers were well and boldly arranged, and made an attractive exhibit.

Messrs. George Jackman and Son, Woking, Surrey, also had an exhibit of *Roses*, bunches and single blooms. *Gypsophila* was interspersed among the former, but was of doubtful decorative value. W. A. Richardson, *Gustave Regis*, Mme. Alfred Carrière, *Carmine Pillar*, *Amy Robsart*, and *Soleil d'Or* were very good among the bunches, while of the single blooms *Marquise Litta*, Mrs. W. J. Grant, *Victor Hugo*, Mrs. E. Mawley, and *Caroline Testout* were the best.

Hobbies Limited, Dereham, showed the new Rambler *Dorothy Perkins*, plants in pots bearing a profusion of rich pink flowers. Small vases of other *Roses* were also shown by Hobbies Limited, *Lady Battersea* being excellent.

Frank R. Curtis, Esq., Morden Grange, Wormingford, near Colchester, exhibited some very good single blooms.

THE BEST BLOOMS.

The silver medals of the society were awarded as follows:

Nurserymen.—For the best Hybrid *Tea*, to Bessie Brown, one of the most perfect specimen blooms ever seen. From Messrs. D. Prior and Sons.

For Hybrid *Perpetual*, to Mrs. John Laing, a bloom of grand form and superb finish; also from Messrs. D. Prior and Son.

For the best *Tea Rose*, to Messrs. Prince for a magnificent bloom of Mrs. Edward Mawley.

Amateurs.—For the best Hybrid *Tea*, Bessie Brown, a very handsome bloom. Exhibited by A. Tate, Esq.

For the best *Tea* or *Noisette*, a lovely bloom of *Muriel Grahame*; also from A. Tate, Esq.

For the best Hybrid *Perpetual*, to Mrs. John Laing. Exhibited by E. B. Lindsell, Esq. A very handsome bloom, perhaps rather pale in colour.

MISCELLANEOUS.

JUNE IN THE BROOME GARDENS, BATH.

SELDOME it is that one can walk through these gardens without seeing much beauty, and even a frequent itinerary affords interest, since there is sure to be something fresh to chronicle. In early June the rockeries are particularly interesting, although the bog garden is somewhat in abeyance, one of the brightest things in it being *Lysimachia Nummularia aurea* in splendid colour. Although this *Creeping Jenny* belongs to a far from rare and rather uninteresting family, it is distinctly valuable for bog garden edgings and so on, and has

not the common sort of look that, rightly or wrongly, I always think there is about the ordinary Jenny of the neglected window-box and London area, perhaps because one often sees the plant in such squalid surroundings.

On the sunny side of the long broad walk that intersects the garden several more rockeries have been made, chiefly planted with Saxifrages and Sempervivums, and on these some large patches of Sempervivum arachnoideum show plainly how well another rather ordinary plant repays good culture and a knowledge of its best use. Seen in the usual little tufts *S. arachnoideum* is nothing; in a rocky hollow, low down beside the path and in full sun, it is a lovely bit of colour, with its pale leaden green in shades, and its rosy fleshy buds pushing above. Some young tufts of *Arabis lucida variegata* planted among the encrusted Saxifrages and House Leeks are curiously like them in habit, with neat rosettes of deep green edged with butter yellow, and are not a bit like the rest of the family. *Linaria pallida* was pretty, beginning to be a carpet plant to some of the larger Saxifrages. *Achillea rupestris* is a pretty little plant, also enjoying the sun on this rockery. Its white flowers are just like those of *Achillea umbellata*, sharing the same rather uncommon texture. Two or three *Ranunculus* species were in bloom, but these are mostly of botanical interest rather than fit for the show rockery, for their bloom is insignificant compared with the rather weedy growth of foliage, and *R. aconitifolius*, which everybody knows, is a very good type of many of them in habit. *Geum montanum*, growing well by some rock steps on the shady side of the walk, is a charming thing. It has neat leathery leaves, deeply cut in round tufts close to the ground, and the yellow flowers, Buttercup-shaped, are large in proportion and solid in texture, curiously tufted as they go to seed, with spreading reddish filaments.

A little further on two *Ramondia pyrenaica* presented an instructive contrast between (presumably) a young plant and an older one. The latter was really splendid, a huge rosette, vigorous in green, and covered with very fine blossoms of extra size. These were on the face of a shelf below a planting of *Rhododendron ferrugineum* just beginning to flower. I looked about hoping to see some of the other *Ramondias* doing equally well, but there were no more, at all events in that particular site. *Pernettya mucronata* looked very pretty close by; this is one of those most useful little shrubs that can be safely planted on rockeries and will not encroach. There is often a good deal of flatness about rockery work devoted to choice alpine, and those who suffer from this tendency to too level planting, either in themselves or in their gardeners, should mark and learn Mr. Milburn's methods, for he knows exactly how to back up and diversify his small alpine with the right sort of shrub planting. *Olearia stellulata* was the showiest shrub of the season on this occasion, its sage green neatness most profusely branched and covered with the white starry flowers that so exactly resemble one of the *Michaelmas Daisies*—is it *Aster ericoides*? *Cistus lusitanicus* is a lovely thing. I have always liked *C. florentinus* the best of the family as a rock shrub, but *C. lusitanicus* has even larger flowers of the same exquisitely clear white, with the same golden centre, and is a delightfully neat and dwarf bush, in a young state, as seen here. *Maianthemum Convallaria* is a very uncommon little plant, and has considerable charm. It is now a well-spread mass, on the shady stones, with leaves shorter, broader, and more wrinkled than those of a *Lily of the Valley*, otherwise recalling them, but closely clustered to the soil. Over these rise the neat spiky plumes of white flower, like miniature blooms of *Tiarella cordifolia*. *Cornus sanguinea variegata* in the grass bank is a pretty small bush, its green leaves sharply edged with cream. *Rubus japonica bicolor* reminds one in its tinting of *Vitis heterophylla* var. Its cream, pink, and pale green are pretty, but if the evidence of the very small shrubby plant here is to be taken it is not at all a strong grower, and therefore all the better for choice rockery purposes. There was a good planting of the rather weedy-growing *Erigeron philadelphicus* on a sunny

bank, where its pleasant—if rather insignificant—pink flowers looked pretty. It was good to see *Androsace lanuginosa* perfectly happy and running swiftly down a cleft between two big rocks above another silvery green crusting of the Spider-web sempervivum. A double pink *Dianthus* (labelled D. Marie Pare) was a pretty thing, of a charming shade of pale strawberry-cream, while on the way out a very well-grown large plant of *Ononis fruticosa* drew attention to its bright pink flowers and graceful leafage.

M. L. W.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—H. G. G.—*Hemanthus coccineus* (the Blood Flower).—Miss W.—*Twayblade* (*Listera ovata*).—W. G. C.—*Ulmus montana* var. *crispus*, natural order Urticaceae. This is a variety of the Wych Elm. It is not very common, and is not a quick grower. It would not make a very good shade tree.—Mrs. D.—This appears to be a species of *Myosotis*, but the flowers were so withered on arrival as to be quite unfit for determination. Perhaps M. de Vilmorin could give you the name.—Constant Reader.—*Cryptomeria japonica* var. *nana*.—C. E. F.—*Pittosporum Tobira*.—*Sierberna*.—*Allium siculum*.—Evelyn R. Reid.—1, Probably a species of *Centaurea*; please send again when in flower; 2, *Veronica spicata*; 3, *Symphitum asperum*; 4, *Hieracium* species.—Good fellow.—The big leaved *Veronica* is *V. speciosa* var., the small leaved *V. pinguifolia*, and the white leaved *V. lucana*. The other shrub is *Spiraea canescens*.—C. West.—1, *Dendrobium moschatum*; 2, *D. crystallinum*, an albino form which is not common; 3, *D. moschatum*.—R. Quarry.—1, *Saxifraga Geum elegans*; 2, *S. curvifolia*; 3, *Thymus asoricus*; 4, *Campanula muralis* (*portenschlagiana*); 5, *Corydalis capnoides* var.; 6, *Gypsophila prostrata*; 7, *Helleborus vulgare* var. (Sun Rose).—W. D.—*Hieracium aurantiacum*.

"Ampelopsis japonica" (H. Y. O.).—There is really no such plant as *Ampelopsis japonica*, though the name is very generally applied to the Japanese form of *Rhus Toxicodendron*, a very poisonous and most dangerous plant, which is in no way related to *Ampelopsis*. To add to the confusion this *Rhus* was a few years ago largely distributed by a firm of nurserymen as *Ampelopsis Hoggi*, and may be often seen bearing this latter name. The Japanese form of *Rhus Toxicodendron* differs in no way from its North American relative, and both are poisonous enough to merit the United States name of the Poison Oak or Poison Ivy. Fortunately the *Rhus* and the *Ampelopsis* can be readily distinguished from each other, for the *Rhus* has only three leaflets, which are not toothed, and are more rounded and less pointed than the *Ampelopsis*, while in this last the leaflets are five in number.

Cacti (G. B.).—No apparent fault can be found with the conditions under which your Cacti have been wintered, except that a temperature of 45° to 55° would have been better. Still, from your description they are undoubtedly in a bad way, but what brought it about it is impossible to say. Perhaps the structure in which they were wintered got even lower in temperature than that stated by you. Your only remedy is to shake them entirely clear of the old soil, when you will probably find very few roots. Then repot in clean, well-drained pots (not too large) in a compost of two parts good loam to one part of leaf-mould, and one of sand and pounded brick rubble combined. When potted the plants may be stood in that portion of the greenhouse where they are shaded from direct sunshine, syringed two or three times a day, and given enough water at the roots to keep the soil fairly moist, but not too wet. In this way root action will become gradually re-established if the plants are not too far gone, and in time they will recover their normal plumpness, when they may be fully exposed to the sun's rays. We were consulted last year with regard to a collection that had got into a bad way, and by following our advice, as detailed above, nearly the whole of them were restored to health and are now in good condition. Briefly, the cultivation of this class of Cacti may be summed up as follows: They flower, as a rule, in May or June, during which period they must be shaded from direct sunshine, as this causes the blooms to remain fresh longer than would be the case if fully exposed to the sun's rays. After the flowering season is over the plants that need repotting should be at once attended to, the most suitable compost being as above given. The plants need to be well supplied with water during the summer months when they are making their growth; indeed, if the roots are in good condition an occasional dose of weak liquid manure is beneficial at that period. Throughout the summer they may be kept in the sunny part of the greenhouse, or placed in a frame fully exposed to the sun,

the lights being put on during heavy rains and in cold, damp weather. By September they should be removed into the greenhouse (always in full sun), where they will pass the winter. During the winter enough water should be given to keep the soil slightly moist, but no more. With the return of spring, however, this must be increased.

Tropaeolum polyphyllum diseased (T. A.).—We believe the failure generally is due to some fungoid attack, though in the example before us no fungus could be traced at the moment. If on noticing a similar instance you would send the perfectly fresh example in a box in slightly damp moss we will endeavour to investigate the matter.

Weevil on Peach and Lapagerias (A. J. W.). It is not often that Peach trees and *Lapageria* plants are infested by weevils. The best and only effective cure for them is to shake the trees well, when many will drop off. These must be collected and burned, and the trees and plants carefully examined afterwards, and every insect found picked and destroyed. By careful and patient attention a hand picking the weevils may be entirely eradicated. No insecticide we know of will kill them without at the same time severely injuring the foliage. Ordinary strength fumigation has no effect upon them.

Growing Tree Carnations (JOHN WORTINGTON). It is unfortunate that you have not given the size of plant or even the pot, as this would have been a clue as to whether the plants are young or from freshly propagated stock, or what appears more likely by your note plants that have finished the winter flowering and now are pushing secondary or useless buds. In any case the flower buds must be removed, and sufficiently low down that only growth buds reappear afterwards. As you wish only for winter flowers you had best read carefully the article on "Tree Carnations" which will soon be published in our columns, and you may possibly obtain some information therefrom. All we can now say from the information you afford us is that Tree Carnations intended for winter flowering should now be strong bushy plants with some half dozen side shoots in 5-inch pots. Any time in July these plants should be transferred to 6-inch or even larger pots, depending upon their kind. As you do not name the kinds you have, we cannot assist you individually in this respect. We may say this, however, that to obtain flowers in winter it is essential that the flowering spikes be pushing towards the end of September. If this is ensured the flower is well advanced before the arrival of the short, unless, and, worst of all for the winter Carnations, foggy days, after which good flowers may be relied upon.

Siberian Crab-twigs injured (H. D. R.).—The late frosts, both last year and this, have been responsible for damaging the leaves of the Siberian Crab in many places, and this is probably the matter with yours, particularly as the growth appears healthy. The specimen of Grass sent was not sufficient for correct identification. If you were to bury Carrots or Potatoes in your ground and examine them every other day you would in time exterminate your wireworms. Another plan is to water the ground with a strong solution of mustard and water. This, however, cannot be relied on to the same extent as the other way. The last bright yellow Rose for outdoors is the Austrian Briar (*Rosa lutea*), or, failing this, *Rosa Harrisoni*.

Lilium candidum bulbs failing (H. B.).—If bulbs are attacked by that terrible Lily disease which has played such havoc with the culture of *Lilium candidum* throughout the country. Numerous remedies have been tried, but in the majority of cases success has only been partial. It is caused by a fungus, *Botrytis cinerea*, and the cold wet weather has proved so favourable to the spread of this pest that we are receiving complaints from all quarters. Mr. G. Massee, the authority on fungi at Kew, recommends spraying with a solution consisting of 2oz. of potassium sulphide dissolved in three gallons of water. The soil should be thoroughly drenched at the same time with a solution double the strength.

Dwarf Caladiums (BARONESS VON S.).—We do not know any smaller *Caladium* than that of which you send the leaf (*Argyrites*), but, of course, even in its case the treatment given will have some effect on the size obtained. A second small-growing form is *minus erubescens*, in which the leaf has a bright red centre with an edging of green. These two varieties are grown in large numbers by some of the nurserymen around London, they are in great demand for various decorative purposes, such as the edging of groups and for table decoration. Both these *Caladiums* are naturally of a tufted habit, that is to say, each plant pushes up at least two or three tufts or crowns of leaves, and often many more. A convenient way of growing them is to put them in pots 3 inches or at most 4 inches in diameter, in a compost of equal parts of loam and leaf-mould, with a liberal sprinkling of sand. The month of February is a good time to pot these *Caladiums*, and if placed in a light position in the cool part of the stove they will come on gradually, and be valuable for decorative purposes in late spring and summer. Plunged in a gentle bottom heat in the warmest part of the stove they will come on quicker, but they will not stand exposure so well as those which have been grown cooler. You can do nothing with water at this season except to keep supplied with water, as the growth is complete, and in autumn they will go to rest. Keep dry during the winter, and in February shake out and repot.

GARDENING APPOINTMENT.

WE understand that Mr. E. Scaplehorn, who for the past nine years has been in charge of the alpine and hardy plant department of Messrs. Jackman and Son, Woking, is about taking over a similar charge for Messrs. William Cuttiss and Sons, Highgate, who are making a feature of this department. Mr. Scaplehorn enters upon his new duties about the middle of July.

THE GARDEN

No. 1651.—VOL. LXIV.]

[JULY 11, 1903.]

THE NEGLECT OF THE VERBENA.

VERBENA "WARLEY," the brilliant scarlet raised by Miss Willmott and shown at the Royal Horticultural Society's meeting on Tuesday, recalls the time when this flower gave colour and beauty to many an English garden and park, and "Warley" is just the type of flower to bring the Verbena once again into popularity. Another variety, Ellen Willmott, also raised by Miss Willmott, is already an established favourite, and we hope that more varieties of equal vigour and of as fine colouring are yet in store. There must also be many varieties of the Verbena in English nurseries which are better than some later developments, that are larger in every way, and have conspicuous white eyes. These, though they may have a bright effect in the single bloom, tend to a muddled look in the mass, so that a bed or patch of them fails to have the brilliant effect of the smaller blooms without the eye. The varieties Miss Willmott is raising are purely self-coloured and free from any "spottiness," and for this reason we welcome them as good garden flowers. A few years ago we asked Messrs. Keynes to tell us the reason why so fine a flower as the Verbena should be so neglected, and their reply should be interesting at the present moment. It is as follows:

"We believe that the one thing which caused the Verbena to be neglected was the extreme forcing to which the plants were in many places subjected in their propagation—and the failure which followed, as a matter of course. The practice was, and probably is still, for cuttings from old stools to be put in during the months of March and April, and kept at a very high temperature for about a week, by which time they were rooted. These were sold as rooted cuttings at a small figure, without any hardening off or any of the careful treatment such tender subjects should receive. This resulted in a weakened constitution, and insect attacks followed. The fungoid disease generally known as 'black spot' came after this, and so injured many stocks that they were given up in despair.

"Those who are fond of Verbenas would find their culture quite easy if stools were wintered in cold frames with a protection in very severe weather so that frost does not exceed 5°. Cuttings from these, rooted slowly in March in a manure frame, hardened off and kept cool, produce sturdy, healthy plants, certain to do well planted out in May.

"Our own practice is to root cuttings in August; these are kept in cold frames or in a

cold house devoted exclusively to them through the winter. They are our 'stock plants,' supplied principally to other nurserymen in January and February, and also from which we get our own cuttings for rooting in February and March. The young plants which these cuttings produce are hardened off and stood out in the open with simply a sheep hurdle over them in April."

EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

Buddleia Colvillei in Norfolk.

Mr. W. Riddell, gardener to Lord Walsingham, Merton Hall, Watton, Norfolk, sends two strong flowering shoots of this interesting species. Mr. Riddell writes: "This is the first time it has bloomed here in the open, though planted four years ago and given slight protection during winter until last year, when it was left exposed; 17° of frost were registered during last winter." The flowers are of warm rose-purple colouring.

Herbaceous Calceolarias from Scotland.

Messrs. Wallace and Mills, Benstone Nursery, Johnstone, send us a boxful of herbaceous Calceolarias cut from plants grown by Mr. Brown, gardener, Newfield, Johnstone, N.B. Messrs. Wallace and Mills write that the wealth of bloom is practically over now, but the quality can easily be seen from the side shoots sent, a remark with which we fully agree. Some of the individual flowers measured 2½ inches to 3 inches across, while the plants, we are told, were from 2 feet to 3 feet through. Such exceptionally good culture as was denoted by the flowering shoots sent deserves to be recorded. Messrs. Wallace and Mills kindly send the cultural notes published below. Mr. Arthur Sutton, whose long and wide experience renders him an excellent judge of these flowers, pronounced those grown by Mr. Brown to be some of the best he had ever seen.

The seed should be sown in July in a pan of light soil, which should be placed in a cold frame with a north exposure if possible, if not the frame should be heavily shaded. The seedlings should be pricked off and potted on when necessary, taking care not to check them by allowing the roots to become pot-bound. The best compost to use consists of light loam and leaf-soil in about equal proportions, with a good quantity of sand. When potting the plants do not make the compost too firm. One of the secrets of good culture is to grow the plants quite cool without any artificial heat whatever; in fact, they should never be grown in anything but a cold frame. During severe weather the frames should be matted and the

plants will take no harm. One of the best collections in the west of Scotland is grown in cold frames, the plants having no other protection whatever. The plants must never get dry at the roots. Plants grown under such cool treatment are seldom or never attacked with fly. When showing their flower heads the side shoots should be staked out, and in this way a well-grown plant can be had 2 feet through and a mass of flowers.—G. M., Benstone.

Gloriosa Superba.

Mr. Eden Phillpotts writes from Torquay, South Devon: "Please honour me by accepting a few blooms of *Gloriosa superba*. My plant has been wonderful this year. I also flowered *Gloriosa Carsoni*, Baker. The tuber came from the Zambesi basin, and was sent to me by a brother wandering there. I have had it for two years, and in May it flowered (one blossom) for the first time. I learn it is rare. The flower is very beautiful, purple, fringed with brilliant yellow. I hope it may be my pleasure to send you some next year."

Mr. Phillpotts sent some excellent blooms of the brilliantly-coloured *Gloriosa superba*; we look forward with pleasure to seeing G. Carsoni.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

July 14.—Cambridge Flower Show.
July 15.—National Rose Society's Show at Glasgow; Ancient Society of York Florists'; Ipswich Summer Exhibition; National Sweet Pea Society's Exhibition (two days) at Earl's Court; Formby Rose Show; Thornton Heath Rose Show; Nottingham Horticultural Exhibition (two days).
July 16.—Weybridge Summer Show; excursion of Horticultural Club to Windsor and Frogmore.
July 21.—Royal Horticultural Society's Committees meet at noon; National Carnation and Picotee Exhibition; Tibshelf Rose Show.

Wolverhampton Floral Fete.—We are sorry to hear that a severe storm raged at Wolverhampton on Tuesday, the opening day of this important show. Owing to this we did not receive the report until too late for insertion in the present issue. It will, however, appear next week. We hope the society has suffered no financial loss through the stormy weather on the first day. The judging was still in progress late in the afternoon owing to the bad weather.

Flowers for butterflies.—Another flower which I have noticed as being attractive to Red Admirals is the Scabious. I remember watching numbers of these beautiful butterflies flitting about a row of dark Scabious in my garden in Suffolk, two or three of them being often on one flower head.—R. LYELL, Dorking.

Pea Veitch's Acme.—On page 435 you have a note from Mr. Wythes recommending this Pea. I can endorse all that your correspondent there says in its favour. I have not grown it before, but now have a row about 12 yards long from seed sown on March 16, and from this we gathered on June 28. The seed was sown between Broccoli, and these were planted on land that had Strawberries on last year. All the preparation the land had for the Peas was simply breaking

it up sufficiently deep to draw the drill to sow the seeds in. The ground has not been dug for four years; notwithstanding this, I have never had a better row of Early Peas, and owing to the moist season they have grown 6 feet high. The haulms are literally covered with pods and very low down. I had a dish for dinner on July 2, and have never seen Peas of a deeper green colour when cooked. It is much in advance of the named early varieties, and earlier with me than Gradus, which was sown three weeks earlier than Acme, and was a week later. Added to this, Gradus suffered considerably from the severe cold in April, while Acme was untouched.

—J. CROOK.

A forgotten Rose.—I have read many articles lately on decorative Roses, and am much surprised to find Helene seldom if ever mentioned. I think it is equal to any of its class. It is not quite single. Its flowers are in clusters, and are pale mauvy pink, with silvery white under petals. It also has the great advantage of being an exceedingly strong grower. Last autumn I had three plants, and they are covered with bloom. The plants are now 7 feet or 8 feet high, and very bushy, blooming almost down to the ground. I have one on a west wall mixing itself with a Crimson Rambler—a beautiful combination—one on an arch, and one on a pergola. All are doing equally well. —HERBERT NASH, *Winash, Bridlington, near Bristol.*

Cambridge botanic garden syndicate.—In the annual report to the Senate we read: The artemesian well sanctioned by the Senate has been sunk. The green sand was struck at a depth of 169 feet, and water now stands at a depth of about 21 feet from the surface of the ground. The tower, storage-tank, and other structures are in course of erection, and it is expected that the whole of the work will be shortly completed. During the year 1902, 1,213 plants, 1,174 bulbs, and 3,220 packets of seeds have been received. Contributions have been received from various botanic gardens and a return has been made to most of them, 2,077 plants and 3,959 packets of seeds having been distributed. Special thanks are due to Messrs. James Backhouse and Sons, of York, for trees and herbaceous plants; to Mr. Amos Perry, of Winchmore Hill, for choice hardy plants and bulbs; and to Messrs. James Veitch and Sons, of Chelsea, for Chinese, Japanese, and other plants. Wardian cases have been exchanged with the Calcutta Botanic Garden; all the plants with two exceptions sent in the case from Cambridge reached Calcutta in a healthy condition. Considerable assistance has been given by the Cambridge Garden towards the formation of collections in the new Botanic Garden, Bronx Park, New York. Among new plants that have flowered, and have been or will be published from Cambridge material are *Mystacidium* sp. nov., received from Mr. Cyril Crossland, of Clare College, and collected by him in British East Africa; *Sauromatum* sp. nov.; *Streptocarpus Armitagei*; *Colchicum* sp. aff. *montanum* (to be figured in the *Botanical Magazine*), and *Gerbera* Brilliant, a cross between *G. Jamesoni* and *G. Sir Michael*, raised by the Curator and finer than either parent in size and colour. Other new plants that have flowered are *Pittosporum Fairchildi*, an ally of *P. crassifolium*; *Campanula sulphurea*, exceptional in the genus in the colour of the flowers; *Arisaema mirabile*, probably a variety of *A. speciosum*; *Stapelia luxurians*, an interesting example of carrion flowers, and various hybrid *Gerberas* raised by the Curator. The Curator's travelling allowance has been spent in a series of visits, the direction of which was chiefly determined by a special invitation from Mr. H. J. Elwes, F.R.S., of Coleborne, Gloucestershire. The Curator also visited Dropmore, celebrated for its Coniferae; the establishment of Messrs. Sutton and Sons, Reading; Mr. A. C. Bartholomew's garden, Reading; and the Botanic Garden at Oxford. By Mr. Elwes' introduction a visit was made to Mr. S. F. Moore, of Bourton-on-the-Water, an enthusiastic cultivator of Orchids; and returning, a call was made at Messrs. Cypher and Sons' Nursery at Cheltenham, the Victoria Park, Bath, followed by visits to Canon Ellacombe at Bitton, Ware's nursery at

Feltham, Mr. Worsley at Isleworth, Mr. Frank Smart's garden at Tunbridge Wells, Cannell's nursery at Swanley, and Low's nursery at Enfield. Several days were also spent in the garden and herbarium at Kew.

Stock Sutton's All the Year Round.—This beautiful white dwarf double Stock is well worth noting for its free flowering and compact growth. For pot culture, in my opinion, it far excels the East Lothian, being much fuller, and in addition its purity, clove scent, and perpetual flowering make it one of the best garden and cool house plants we have. I recently saw it in the Royal Horticultural Society's Gardens, Chiswick, bedded out, and it is a most desirable variety, the plants flowering freely throughout the summer and autumn. It is also excellent for sowing at this season for pot culture in the early spring months, and sown for this purpose the plants flower profusely over a long season. The leaves are not unlike those of a Wall-flower; the plant is very hardy, dwarf, and vigorous, and does not when given pot culture exceed 1 foot in height. This new Stock a few seasons ago received an award of merit from the Royal Horticultural Society, and since that date has increased in favour with growers. —G. WYTHES.

Pink Samuel Barlow.—I do not know who is the raiser of this, but should infer from the name it bears that it is of Lancashire origin. It is of dwarf, compact growth, and produces grass freely. The flowers are white, with a very dark, almost black, band round the eye; of good size, full, but much fimbriated; the flowers stand erect, which is a quality wanting in many Pinks. It may be noted as an excellent variety for cultivation in pots, and also for the border. —R. D.

Rondeletia strigosa.—This near ally of the *Bouvardias* is a delightful intermediate house shrub when flowering so freely as it is in the T range at Kew. It forms a freely-branched little bush, clothed with shining green leaves, while the flowers, in shape like those of a *Bouvardia*, are bright crimson, with a yellow centre, and in neat, compact clusters. It is a native of Guatemala and is quite a rare plant in gardens, though deserving extended cultivation. Apart from its own intrinsic worth it might, in the hands of the hybridist, mate with some of the *Bouvardias* and develop a new race. —T.

Grevillea Banksi Forsteri.—One of the most interesting of the many beautiful plants now flowering in the temperate house at Kew is this rare *Grevillea*. It is one of the large-growing members of the genus, attaining in its Australian home almost the dimensions of a small tree. The specimen referred to is in a pot, and this amount of restriction has probably induced the formation of flower-buds. The plant is rather upright in growth and clothed with pinnate leaves, in vigorous examples, nearly a foot long and more than half as much in width, the divisions being about a quarter of an inch wide. When young the leaves are quite silvery on the under sides and to a lesser extent above, but when mature the upper surface loses this silvery character, and the under side is less so than when young. The flowers, which are borne in terminal, cone-shaped racemes, are bright red, almost scarlet. In common with most members of the genus the long style is conspicuous, being as bright as the rest of the flower. —H. P.

Hydrangea Hortensis or hortensis.—The specific name of the common *Hydrangea* is a puzzle, and which of the above two to use I really do not know. The matter appears to me to stand thus: In my younger days it was always *Hydrangea hortensis*, then a decade or a little more ago the specific name of *Hortensis* was occasionally used. In the pages of *THE GARDEN*, Mr. Bean of Kew, called attention to the fact that the name *Hortensis* was erroneously given to it, for the plant was named in honour of Queen Hortense, hence the word should be *Hortensis*, and as such it has been used in *THE GARDEN* ever since, the last time as recently as June 27. This nomenclature is followed in the first "Kew Hand List" of trees and shrubs, published in 1894, and after that there seemed no doubt as to its correctness. Judge,

therefore, my surprise on referring to the list published last autumn to find that the old system of nomenclature is adopted, and the plant is once again *Hydrangea hortensis*. I should have regarded this as a slip, but for the fact that the specific name of *Hortensis* stands first in the list of synonyms. —H. P.

Technical education as applied to horticulture.—The air is full of technical education just now. A remarkable letter was recently addressed to the London County Council by Lord Rosebery, and this important subject is emphasised by some utterances of Mr. Chamberlain at the University at Birmingham on the 4th inst. Mr. Chamberlain, Chancellor of the University, said they were spending £300,000 in building a new university and laying out three great departments for engineering, mining, and metallurgy, further remarking that the new Birmingham University would, in some of its features, devote itself to the special needs of the district. He warned Lord Rosebery that the space offered for the new institution at South Kensington by the Royal Commissioners of the Exhibition of 1851, was altogether too small. At any rate, Mr. Chamberlain zealously advocates free trade in education! The allusion to the Royal Commissioners leads up to the horticultural aspect of this vital question—vital because it so seriously affects us as a nation when we look at what our Continental neighbours are doing. There is now a noble opportunity for the Royal Commissioners to make some restitution and to deal in generous terms with the art of horticulture by giving increased space at South Kensington, so that technical and horticultural education may be included in the curriculum of a scheme which, says the vice-chairman of the London County Council will be dealt with in a broad and statesmanlike way. How far we are behind France, where, throughout the country, practical gardening is taught in the primary and elementary schools. From returns issued some years ago there were then some 28,000 of such schools, each of which has a garden attached to it, and under the care of a master capable of imparting a knowledge of the first principles of gardening practice. It was then decided that the number of such gardens should be largely increased; further that no one should be appointed master of an elementary school unless he could prove himself to be capable of giving practical instruction in the culture of the soil. —Quo.

The common Woodbine.—At the present time nothing is more beautiful in our grounds than a large bush of this sweet-smelling shrub. During the past four or five years it has taken possession of an old Holly growing on a bank and close to where the Honeysuckle had occupied a place for years. Owing, however, to the hedge being clipped every previous year it could not extend. It has covered the top of the Holly for many feet, and is a sheet of bloom. The yellow flowers make a beautiful contrast to the dark Holly leaves. This is the kind of planting we want more of in many of our large private pleasure grounds instead of the everlasting Laurels, Yews, &c. Nor would such a piece of colour (common as it may be) be despised in some of our public parks and gardens.

Rhododendron Pink Pearl.—Late-flowering *Rhododendrons* have flowered well this year, no doubt this is due to their strong growth last year. Those who visited the Temple show probably noticed the Pink Pearl *Rhododendron*. All the forms in the group in which this was shown were good, but this eclipsed them all for size of truss, colour, and bold effect. It is somewhat new, and must be scarce for a few years, but when it can be obtained at a reasonable price no doubt we shall see it in all good collections. Evidently it is a good grower and a fitting companion for such varieties as *Kate Waterer*, *Mrs. J. Clutton*, *R. S. Field*, *James Marshal Brooks*, and many others. When residing for many years in North Hants I often paid a visit to the Bagshot Nursery, especially when the *Rhododendrons* were in bloom, and well I remember the fine trusses and colour of *Kate Waterer* when first introduced. —J. CROOK, *Chard, Somerset.*

Beauty of *Luzula nivea*.—Mr. Hartland's interesting note in your issue of June 20 upon the subject of *Luzula sylvatica* suggests an opportunity of singing the praises of another plant very rarely seen in English gardens—*Luzula nivea*, so common in many parts of Switzerland and Northern Italy. It is a lovely plant and seems easy to establish, some little bits I brought a few years ago from Monte Generoso having grown into big clumps. It lasts a very long time in water, and I cannot help thinking it would prove a fine subject for market gardeners.—CHARLES PRENTIS, *Milton, Sittingbourne*.

Flowers to attract butterflies.—I consider there are no flowers which attract the Red Admirals—in fact, all butterflies—so much as the Scabious. Mine is essentially an autumn garden, so I always grow quantities of Scabious, and to see the various butterflies playing on the flowers during a sunny day in late August and early September is truly wonderful, for they seem as if they cannot leave them.—J. E. LEEDAM, *The Leasowes, Hilderstone, near Stone, Staffs.*

***Cardamine rotundifolia*.**—This is a charming spring-flowering plant, pure white, very early and free. The late Mr. William Ingram used it in his early spring garden at Belvoir, and praised it highly. He was much devoted to selecting for early blooming, and in this way gained in precocity—educating his flowers as he termed it—and some of them appeared to be quite docile in his hands, among them the *Cardamine*. The double form of our common native Cuckoo Flower well deserves a place in the spring garden.—R. D.

Dwarf bedding *Nasturtiums*.—Undoubtedly the best of the dark-coloured varieties is Mrs. Sanderson. This is one of the true dwarf compactum type, with dark maroon flowers thrown well above the foliage; it forms a dense, compact growth, crowned with blossoms. It seeds very sparingly, which is helpful to continuity of bloom. It should be propagated from cuttings. This has pale green foliage. Empress of India, when represented by a carefully selected stock raised from seeds, such as I saw in the seed trial-grounds of Messrs. W. W. Johnson and Son, at Boston, two years ago, is of compact growth, with dark shining green foliage, the flowers of a rich deep crimson, thrown well above the leaves. What is to be avoided in the case of dwarf *Nasturtiums* is the kind of plant which buries its flowers amid its leaves, and so presents a very confused appearance to the eye. This defect often arises from lack of care in selecting seed parents and taking the seed indiscriminately from any plants, however objectionable their habit of growth. Mrs. Clibran, yellow, appears to be wanting in constitution as far as my own experience goes. When it does well it has the true compactum habit, and blooms very freely. A variety known as Luteum Improved is also a good yellow-flowered bedder, and is found to come quite true from seeds. The best dwarf scarlet compactum is Bedford Rival, which has all the good qualities of a dwarf bedding *Tropaeolum*. The varieties of the compactum race should not be confounded with the ordinary Tom Thumb *Nasturtiums*, as they produce flowers of much better form, are more compact in growth, and, as they seed very sparingly, they are much more continuous in bloom. It is only by careful selection of the plants as seed-parents that the strain can be kept up to a high standard.—R. D.

THE TULIPAS.

(Continued from page 442, Vol. LXIII.)

TULIPA GREIGI (Regel).—A massive and sturdy Tulip from Turkestan. The leaves are broad, very stout, veined and flecked with chocolate; flowers scarlet, of exceptionally fine form, the outer petals pointed, the inner petals very broad, rounded, reflexing when expanded, basal colouring black or brown, with or without a yellow dividing band; a gorgeous Tulip, and may be grown well in any light soil, but must be lifted to ripen for at least three months. A large number of forms have received distinct

names, but as the colours are, unfortunately, not at all constant, it is not proposed to make use of them here. The plant varies greatly from seeds, and collected batches contain several forms distinct from the type. In south European countries the plant sports into an infinity of forms, many of which have reached England, but they have not succeeded, and the importer, unless he is very fortunate, has to fight a destructive fungus they leave behind them as a legacy in recognition of his efforts in removing them from a climate where they did well to our own, where they fared badly. *Aurea* is the only one that can be depended upon.

T. Hageri (Heldreich) is a brick-red flowered species of medium size, the basal colouring of which is in the form of a large, badly defined, black and brown blotch. It can only be described as a wretchedly poor flower, lacking refinement in every detail.

Var. nitens (Wallace), a form from the westernmost Cilician Taurus, has many striking qualities. The leaves resemble those of *T. sylvestris*. The flower spans 3 inches, coloured a flame orange-red, flushed with grey and bronze externally, and the centre of the flower is furnished with a small vivid black blotch. Its flowers resemble the native species in shape, and it is just as easy to grow. Any soil or situation suits it, and one can recommend it as a very attractive little plant. In flower it most resembles a patch of the scarlet Windflower.

T. kaufmanniana (Regel).—A Turkestan species of recent introduction, and one of the most charming Tulips possible to obtain. It is the first of its race to open, often braving a severe spell of winter during February quite unharmed. It is a dwarf plant 12 inches high as a maximum, the flowers are cone-shaped when closed, flushed with red externally, coloured cream internally, silvery near the margins, base deep orange, often with a zone of intense vermillion as a dividing colour, but frequently without it or in a modified form and degree. It is a capital rockery plant, invaluable when grown in pots for the cool alpine house, where it could reach its finest development whatever the weather. It likes a hard, poor subsoil, preferably little bits of rock, and needs a good summer's baking to ripen. It is easily raised from seeds, but home grown seedlings do not show the rich external and internal reddish colouring so characteristic of the native grown plant. Though not an

HYBRID TEA ROSE CAROLINE TESTOUT (REDUCED).

(Shown on many stands at the recent exhibition in the Temple Gardens.)

expensive bulb it is still rare enough to be welcomed with enthusiasm whenever seen in good condition.

T. kolpakowskyana (Regel).—The names Regel gave to his plants were probably more familiar to his ears than to ours, certainly he did not err on the side of brevity in christening plants. This Tulip is a very pretty species, with lanceolate ascending leaves 6 inches to 12 inches long. The flower-buds are pointed, contracted near the middle, and 3 inches long as an average. The petals are coloured yellow, varying in tint, flushed externally with red or scarlet, the medium line being green or grey. They are generally equal in size. A pretty Tulip, flowering in April and May, valued for its graceful habit and charming flowers. It requires the treatment recommended for *T. kaufmanniana*.

T. Korolkowi is a very small and slender growing species, with crimson flowers furnished with minute basal spots. In size the flowers are no larger than a Hazel nut, but they are very brightly coloured and exceedingly interesting.

Var. bicolor is a very bright coloured little plant. It has very narrow grass-like leaves, slender stems a span high, bearing cone-shaped flowers, the apical half of which are coloured golden-yellow, the basal half vermillion. The colouring of this Tulip exactly resembles the old garden variety Keizer's Kroon, but its size does not exceed that of a Filbert nut. It is suitable only for rockery planting or for pot

culture. It flowers in March, and hails from Asia Minor.

T. lanata (Regel), another small flowered Asia Minor species, has broad glaucous leaves and cone-shaped flowers with flat petals, coloured a rich scarlet down to the base. A very neat and beautiful little plant under 8 inches high, but very hardy, and possessing a strong constitution. It thrives well on a rockery, and appears at its best in a tuft of low-growing herbage that would support its slender stems. It need not be lifted to ripen, but the subsoil should be hard or it will make "dropper" bulbs, thrusting them a foot deep in a loose soil. It flowers in May.

T. Leichlini (Regel), a native of Kashmir, proves extremely difficult to grow and flower well, and one has doubts as to its hardiness in an English climate. It has slender stems, deeply channelled leaves, and cone-shaped flowers, which reflex when expanded, coloured white internally, coral-red externally. It has a general resemblance to *T. clusiana* in the shape of its flowers. The plant requires further study before details of its cultivation can be given, and it is too rare to admit of ample experiment.

T. limifolia (Regel), also from Asia Minor, has lax narrow leaves and dazzling scarlet flowers that are contracted near the middle and self coloured throughout. The petals average $1\frac{1}{2}$ inches to 2 inches in length, with pointed tips, and they expand during very bright sunshine only. It is very close, botanically, to *T. lanata* and *T. wilsoniana*, and may be similarly grown.

T. Lownei.—This is a native of Cilicia, and a sturdy, dwarf, Crocus-like species, with very small bulbs, prostrate twisted lineal leaves, and pink or pale rose flowers coloured greenish externally, the inner petals being much broader, and keeled with bronze; basal colouring clear yellow. The flowers much resemble those of Crocus of the reticulata type; they span from $2\frac{1}{2}$ inches to 3 inches across, and expand only during bright sunshine. A pretty rockery plant, charming in its quaint habit and pretty rose colouring; it is best adapted for rockery cultivation, but may be well grown in pots for the cool alpine house. It flowers in April, and there are two forms in cultivation varying in the degree of colouring only.

GEO. B. MALLETT.

(To be continued.)

THE FLOWER GARDEN.

THE CARNATION AS A MARKET FLOWER.

TO those intimately connected with flower culture for market the popularity of the Carnation is well known, and that it should have become a powerful competitor with the Rose for the premier position is not at all surprising. When we hear of as many as 60,000 plants propagated and cultivated in pots in one establishment for providing cuttings alone, and these figures are exclusive of some thousands of Malmaisons, we have to acknowledge that the Carnation has gained a position of great importance in the market; and the market accurately indicates popular taste and appreciation or otherwise of any particular flower that is brought before it.

The methods of cultivation adopted by the market grower differ but slightly from those practised in private establishments. The market grower prefers always to keep all his

plants under glass, thus exposing them to less risk by disease and insect pests than when they are placed out of doors, say, from the middle of June to the middle of September. One thing at least is certain, that large numbers of plants are more easily and more effectually dressed with insecticide when under glass than they can be when in the open air exposed to rains and storms. Judging by the healthy condition of plants seen in Messrs. Beckwith's famous nursery at Hoddesden in the early part of June, in various stages of growth—from those being transferred from 3-inch pots to 6-inch pots to those laden with a magnificent crop of flowers—he would indeed be a keen observer who could point out a weak point in their condition. In what respect the soil used may differ from that available to private growers I am not able to say, but the additions to the loam and leaf-soil, which form the staple of the compost, are the same as used by gardeners in private places. Yet I do not hesitate to say that the market grower, by the uniform condition of his plants and by the regularly large crop of flowers produced, shows to better advantage.

The selection of varieties is a matter of great importance; many points have to be considered. Colour is decided by the demand, and on this point I notice that pink of various shades claims the majority of admirers, as by far the greater number of the plants grown were of one or another shade of pink. Scarlet or red probably comes next, but is only a poor second. Yellow appears to be in good demand, and here is the best opening for the raiser of new varieties, as there is a decided lack of those of a yellow shade possessing the various characteristics required by the market. Whites are not largely grown, probably for a similar reason. Self colours only appear to be in demand at the present time. Size is a point of considerable importance, as very small flowers are practically useless in the market, and as the grower has a great many expenses to meet he must study what brings grist to the mill. In this respect he finds that flowers of medium size are the best, provided they are of good shape and substance, possessing broad, smooth-edged petals, and are well filled up in the middle, so that when the bloom is fully expanded it does not present a semi-double appearance, and that the outer or guard petals do not unduly droop. These little points all contribute to the lasting qualities of the flower, and what is of equal importance is a good stout stem that, when cut from 18 inches to 2 feet in length, will support the flower in an almost upright position without the assistance of wire, which is always so objectionable in floral arrangements. A flower such as here described is never to be found with a split calyx, therefore what are termed pod-busters are discarded as soon as discovered. Mere size, whatever its colour may be, finds no admirers in the market. A few of the popular varieties are noted below, but it must not be imagined that the grower for market ties himself down with any prejudiced ideas that he has already got everything that is good and worth having. On the contrary, he not only tries every new variety as it comes out, but makes special arrangements with the large Continental raisers to have all their new sorts submitted to him for trial, and in this way gets first hold of every new suitable variety.

Day Dream is a medium-sized bright pink flower of good form and substance; the plant is a free grower and bloomer. Renown, of a salmon shade of pink, is a very profuse bloomer and of good constitution. The guard petals droop a little, and are also a lighter

tint than the other parts of the flower; this is one of the very best for cutting from November to March, and a most reliable variety. Mme. Melba is of a darker shade of pink than either of the preceding varieties, and is reliable for market work in winter and spring; it has a long, stout stem. If the quantity grown is proof of its excellence, Royalty may well claim premier position among Carnations; the flower is of a pleasing deep shade of rosy pink, larger than any of the above varieties. The plant is vigorous, producing an abundance of "grass," very free flowering, and its flowers are produced on stout, strong stems from 3 feet to 4 feet high. They can be cut 2 feet or more in length. This is a flower that lasts long when cut, and is quite the favourite. Dawn is esteemed mostly for its colour, which comes closely to the old Malmaison. Among red or scarlet Sunbeam seems to be the most popular variety. It is a free grower, of good constitution, and a very useful winter flower. Flora Hill and White Cloud are the whites most in favour at the present time for winter and early spring. Flora Hill has a serrated guard petal, and is slightly the larger flower. White Cloud has smooth petals, and is a profuse bloomer. La Grandesse is a newer candidate for popular favour, and by some growers is considered to possess distinct merit; it is pure white and large. The plant, however, appears to lack vigour and constitution. It should not be placed in anything larger than a $4\frac{1}{2}$ -inch pot the first year; in constitution this reminds me of Empress of Germany, which has practically gone out of cultivation. Of yellows Cecilia is most appreciated at the present time, although it is not considered a good winter flower. Duchess Consuelo, sent out by Messrs. Dicksons, of Chester, is still held in high esteem for early spring; but in the hands of some growers it is found a little difficult to manage.

J. JACQUES.

TREES AND SHRUBS.

SOME ORNAMENTAL TREES.

ACER PSEUDO-PLATANUS ALBO-VARIEGATUM.

AN elegant tree is the above, and in spring, when the foliage is fresh, its colours are especially beautiful, and this is the case even with trees growing upon heavy soil, not usually considered the best to promote bright hues in variegated foliage. There is a good pyramidal-shaped tree of this variety some 40 feet in height growing in the pleasure grounds here, and when it is viewed either from a distance or near at hand its appearance is very pleasing, while an undergrowth of Portugal Laurel and some trees of Copper Beech hard by make its colours appear still more distinct and beautiful. For park planting this tree is particularly well suited, and groups of it associated with other trees would afford a rare and attractive feature.

TILIA PETIOLARIS PENDULA.—This exceedingly beautiful Lime has several synonyms, including *argentea pendula*, *alba pendula*, and *americana pendula*. It is, perhaps, the most handsome of the Limes, but nevertheless it is not often met with. There is a specimen here upwards of 70 feet in height, and being upon a lawn it has had ample opportunities to develop. It has a spreading head as compared with *T. europæa*, and, unlike that species, it does not attain a pyramidal form. Its pendulous habit causes its lower branches to trail upon the ground; its beauty is in a great degree enhanced by its fine foliage, which is comparatively large and thick, dark green upon the upper surface, and of satiny silver beneath. This species usually

blossoms very freely immediately after *T. europæa* is over, and its flowers are larger than are those of the latter, deeper yellow in colour, and more powerfully scented. Its flowers are a great attraction to bees, which visit them in vast numbers. The tree alluded to is worked upon a common Lime tree stock.

FRAXINUS ORNUS (Manna Ash).—The singular beauty and uncommon appearance of this tree ought to ensure its being commonly planted, and yet specimens of it appear to be rare and the tree comparatively little known. The best one that I have seen is at Pontypool Park. It is growing with a grand lot of American shrubs and coniferous trees, where in June it freely produces beautiful greenish white peduncles of blossoms, which make an unique display. The tree has an elevated, though sheltered, position, and is 50 feet or more in height. It would be interesting to know if this tree blossoms in a young state, and if not at what age it may be depended upon to produce flowers. Mr. Lockyer, who has charge of the Pontypool Park Gardens, tells me that the specimen there blossoms freely each year, but it was almost as large when he took charge of it as it is now.

THOMAS COOMBER.

The Hendre Gardens, Monmouth.

THE FRUIT GARDEN.

THE LOGAN AND THE WINEBERRY.

HOW different these two plants are as regards hardiness. The first named is, without doubt, a most useful fruit on account of its vigour and free cropping. Of course they do not both come from the same part of the world, the Loganberry being American, and the Wineberry a more tender plant from Japan. This year our plants of the Wineberry are so crippled by frost that they present a sorry spectacle at the present moment, and one's only hope is that plenty of new growths will come from the base for another year. Some of the Raspberries suffered almost as much. This crop, I should think, will be a scarce one in this part of the country. On the other hand, the Loganberry is bearing grand crops, and did not suffer in the least by the severe May frosts, thus showing its value for exposed places. In the northern part of the kingdom this fruit thrives well, and will become a standard fruit for preserving and cooking purposes, as it bears so well, even in adverse seasons. It is far more reliable than the American Blackberries, and being so hardy is doubly valuable. When preserved the fruit of the Loganberry is much superior to the Blackberry, being more acid. This is a gain, and the fruits being larger are more valuable. Old plants crop well and make a strong growth each year from the base. This is the next season's fruiting wood.

Middlesex.

G. W.

EARLY FIGS IN POTS.

Those who enjoy Figs over as long a season as possible will find the *St. John's* the best variety to give a supply from March till June. There are larger varieties of better flavour, but these do not force well. The *St. John's* variety is above middle size, of very good flavour, and not much inferior to the later sorts. For flavour alone I do not think any variety approaches the Black Figs, such as *Negro Largo* or *Bourjassotte Grise*, but these are not available at the season named, though of great value for succession. Another drawback is that the large Black Figs drop so badly when hard forced, whereas the *St. John's* is the best Fig known, as the crop is retained till the fruits are ripe; the only drawback is that it crops too freely and needs severe thinning. There is another variety much like the *St. John's*, the *Pingo de Mel*, which many consider synonymous. It is very similar in colour, size, and flavour, but the trees with me of the last-named variety are more spreading in the growth, and the flesh is yellow,

whereas *St. John's* is white. They are specially adapted for pot culture. Both varieties received first-class certificates from the Royal Horticultural Society a few years ago. It must not be forgotten that the fruits need careful handling, and when ripe an excess of moisture either at the roots or on the fruits causes what is termed dry spot. I do not intend to go at length into cultural details, but I would add that these two varieties are certainly most profitable in pots, as they never fail to crop freely. The trees placed in a cool house in November and gently forced will give fruits in March. Of course much depends upon the size of the trees and whether the wood is well matured. In July we place our trees in the open, the pots being plunged to prevent drying. The trees give no trouble. They only need a little shortening of stray branches during the growing season, that is, when in fruit. If this is done they will need no further pruning, as that is best done by stopping the shoots every few days or at least once a week when in full vigour. Repotting is best done early in autumn, just before housing, and large shifts should be avoided. It is surprising how small a pot is necessary if food and moisture are given. For many years I grew the *Brown Turkey* and *Osborn's* for first supplies, but these are not so good at the season named. Of course for later use and planted out *Brown Turkey* is doubtless the best all round variety grown, and for autumn the *Negro Largo* grown in pots is most valuable; to this may be added *Nebian* or *Grosse Verte*.

G. WYTHES.

BLACKBERRIES AND ALLIED FRUITS.

THESE useful fruits give variety to the year's supply, and are valuable in the making of jam, jelly, and tarts. They require but little care in cultivation, and grow freely in any ordinary soil. The best results are obtained from plants in rows 6 feet apart, the shoots being trained right and left, espalier style. The fruiting shoots can then be removed every season, and fresh sturdy growths laid in as they are produced for the following year's crop; some peg them down and cut off the ends after August to strengthen the lower buds, which next year produce strong-flowering branches.

All the pruning necessary is to cut away the old fruiting wood yearly, as with Raspberries. When established all grow strongly, and the plants can be placed from 6 feet to 10 feet apart. The American sorts, as a rule, flower freely, but only fruit satisfactorily in a few positions or in very favourable seasons.

Parsley-leaved Blackberry.—This is the best of the Blackberries for general culture. The fruit is very large, freely produced, and the foliage is handsome, the stems being of a rich colour also. It is *Rubus laciniatus*; in point of flavour it is not equal to the wild Blackberry, which can be obtained from any British hedgerow, and well repays the care of good cultivation.

Cumberland Blackcap, or the *Whitewash Bramble* (*Rubus leucodermis*).—This is a handsome plant, the stems being white. The fruit is small and black, and ripens before the wild Blackberries.

Early King is a large-fruited American variety which ripens early.

LOGANBERRIES.

The Lawton is a large American variety.

Lucretia is suitable for culture in damp, boggy land. The black fruits are large and acid and resemble the Dewberry.

Wilson Junior is one of the best large American black sorts, and grows very freely.

The Wineberry (*Rubus phoenicolasius*) is a strong climber and beautiful, even in winter the shoots are thickly covered with red, short spines; in summer the velvety foliage is conspicuous. The reddish fruits are produced freely in the autumn; birds are very fond of them. The berries are small, and when cooked have a pleasant, distinct flavour.

The Loganberry is a vigorous grower, the shoots reaching 10 feet to 12 feet high in a season. Its handsome foliage is striking, and

it gives an abundant supply of large red berries, which resemble Raspberries before they are ripe. The Loganberry is an American hybrid between the Blackberry and the Raspberry. The flavour is rich when cooked. When used for dessert the fruits need to be fully ripe.

The Mahdi.—This novelty is the result of a cross between Raspberry Belle de Fontenay and the common Blackberry, and is a valuable addition to hardy fruits. In habit of growth and foliage it somewhat resembles the Blackberry, and the fruit ripens during the latter part of July and early August. The flavour is excellent, superior to that of the Loganberry.

CHERRY GROWING.

(Continued from page 445, Vol. LXIII.)

CHERRIES IN THE ORCHARD.

BEFORE setting out to plant standard Cherry trees there are a few important points that it is well to consider. The first is suitability of soil and situation. It may be all very well to plant some fruits and trust to chance, but this hit or miss method will not answer with Cherries. I have already pointed out the requirements of the fruit, and may say here that I have seen pounds and pounds literally thrown away in attempting to establish Cherry orchards on water-logged soil. Good drainage is absolutely essential, and without it nothing but failure can result. The second point to be considered is the bird question. Various members of the feathered tribe have a marked taste for ripe Cherries, and to simply plant a few odd trees in an orchard along with other fruits is often only a waste of time and money, as the birds generally get the best part of the crop. If orchard culture is gone into at all sufficient trees should be planted to merit the expense of paying a man or boy to look after the fruit when it is ripe.

From observation and experience I am disposed to think that the best site for establishing an orchard is on arable land, because the trees make a better start when the ground is under cultivation for the first few years than if they are planted in turf. At the same time I am aware that this proceeding is not always practicable, and the next best thing is to keep the ground round the trees for a distance of 6 feet or so bare of turf for a few years. Thirty feet apart is a good distance to plant standard Cherries, which should be supported by stout stakes and be protected from animals of any kind injuring the bark. The grass in Cherry orchards should be kept closely fed off, preferably by sheep, and to attempt to get a risk of Hay from the enclosure means something detrimental to the health of the trees. When in full bearing standard Cherries need feeding, and top-dressings of animal manure are highly beneficial. The contents of liquid manure tanks poured over the roots in the winter help the trees considerably, and where lime is deficient occasional dressings of this material, chalk, basic slag, or old mortar rubble may be applied with advantage.

Pruning.—The prime object at the outset is to furnish the trees with good heads, and this done the less acquaintanceship they have with the knife the better on account of the deadly gum trouble. When newly-planted specimens have got hold at the roots the shoots need shortening to induce them to throw out strong growths that are to form the main branches of the tree, and it is necessary to do a little pruning for a few years in order to shape the heads. After that the less knife the better, and pruning operations consist in going over the trees in October for the purpose of removing dead branches and thinning out growths where there is any danger of crowding. No hard and fast rules can be laid down for this operation; the judgment of the operator must be the guide, though it is well to remember that it is better to err on the side of doing too little cutting than too much.

Varieties.—In the garden list above I have already mentioned some varieties that are well suited to orchard culture, and in this selection I

append the names of Cherries that are frequently met with and do well in the orchards of Kent. Amongst the Cherries known as White Hearts and Amber Bigarreus, we have the Elton Heart, an early orchard variety, that does well in retentive soil; Early Amber, a very early variety, largely grown in East Kent; Kentish Bigarreau or Amber Heart, a splendid mid-season Cherry, one of the standard Kentish varieties; and Bigarreau Napoleon, Florence, and Emperor Francis, all of which are late.

The most desirable amongst the Black Heart and Black Bigarreau Cherries for orchard culture are Early Rivers', Old Black Heart, and Werder's Black Heart, for the first picking, followed by Black Circassian, Turkey Heart, and Waterloo Heart for late use. A few of the Duke Cherries are suitable for orchard culture, amongst the best being May Duke, which is excellent, Royal Duke, and Late Duke.

MORELLO CHERRIES.

All the varieties in this division are suitable for culinary and preserving purposes, while the sharp acid flavour of the fruits is acceptable to some palates for dessert. As a rule Morello Cherries are less exacting in their soil requirements than the sweet kinds, not so liable to gumming, and more hardy. For furnishing a north wall no fruit is more suitable than a Morello Cherry, and if protected the berries will hang till quite late in the autumn, when they are most acceptable. Morello Cherries succeed almost as well as pyramids in the open as they do on walls, and occasionally they are planted as low standards. The habit of Morello Cherries is to produce fruit chiefly on young shoots of the previous season's growth, and consequently the pruning of wall trees consists of removing any useless branches and laying in as much young wood as possible. In the case of trees growing out in the open very little knife work is required when specimens are established. In addition to the Morello of gardens, a useful little Cherry for culinary purposes is largely grown in Kent, known as the Kentish Red. This is the fruit from which most of the Cherry brandy is made. It succeeds well in the form of bushes and low standards, and rarely fails to crop. The Flemish Red is somewhat similar, but it is later and the fruits are rather larger. For preserving and culinary purposes it is a desirable variety. G. H. HOLLINGSWORTH.

(To be continued.)

WORCESTERSHIRE NOTES.

SPIRÆA CESPITOSA.

THIS little gem is one of the latest additions to my collection. It is a remarkable species, so small that a crown piece would entirely cover it, and the dwarfest member of the genus so far as I can

THE ALTAIAN COLUMBINE (AQUILEGIA GLANDULOSA).

(Single plant with 153 flowers and buds.)

ascertain. The plant forms dense rosette-like masses of tiny, narrow, glaucous green leaves, and becomes quite a thick carpet. It is a native of North America, from New Mexico to Northern Nevada, where it grows on damp limestone rocks at a considerable elevation. The flowers, I learn, are small and white, and appear in early autumn on stems 1 inch or 2 inches high. I am trying this interesting plant at the moist edge of a tub containing the dainty little *Nymphaea pygmaea helveola*, and have surrounded it with small pieces of limestone rock.

CYDONIA SAGENTI.

Here is another small subject, and one which has been quite a conspicuous feature in my small rock garden this spring, so much so that I can thoroughly recommend it as a most desirable dwarf shrub for almost any purpose, although from its habit of growth the rock garden would appear to be its proper home. It came to me from Newry under the name of *Cydonia pygmaea*, and, though I cannot at the time of writing trace any authority for this name, I observe that Messrs. Lemoine are distributing a *Cydonia*, which exactly answers to the description of my plant, under the name of *C. Sagenti*. Whatever may prove to be its correct name, it is very lovely, and all through April its erect little spreading branches were smothered with bright orange flowers. In spite, too, of the bitter April weather which so injured many of our hardy shrubs, this handsome little one appeared quite unaffected, and has even set fruit.

SLUG CATCHING.

This subject has been given considerable prominence of late. I suppose the wet summer last year has something to do with this, as it proved

congenial to the welfare of these pests. A correspondent wrote to the *Field* some weeks ago as follows:—"The only effective remedy I can find for a plague of slugs is successional broods of ducklings—a fresh brood every month. No other plan is of any avail in my garden, which has large grassy banks on all sides and meadows beyond them. The late Miss Ormerod kindly gave me the result of her experiments, and she found lime most effective—one application at dawn, another after the slugs had expended a lot of slime, and a third to make sure later on. The slime being their protection, when they have exhausted the supply, lime kills them; but this plan is useless to me, as they keep invading the garden from the grass outside daily. I find a wash of one to twenty-five of creosote acid and water on frames and staging prevents them from climbing, and the deterrent lasts a fortnight at least." After this follows an editorial note to the effect that powdered quicklime will kill every slug or snail on which it falls, and is best as dusted over crops after showers, or in the gloaming, when these marauders are abroad. Most of us, too, will agree with the editor when he goes on to add that ducklings, &c., are very useful, but it is not practicable to employ them in many small gardens.

To the majority of hardy plant growers the remedy suggested is worse than the disease. To have such gems as the *Androsace* and encrusted *Saxifrages* overrun with ducklings (however small) would end, I am afraid, in disaster for the plants. Dr. Bonavia draws attention in the *Gardener's Chronicle* to a statement in "Animal Life" that the favourite diet of the blind-worm (sometimes known as the slow-worm) consists of small grey meadow slugs; and for that reason it is most beneficial to the gardener and the agriculturist. I was extremely interested by some further remarks of Dr. Bonavia's, and have therefore looked up the matter, as the reptile is fairly abundant in this district.

According to "Chambers's Encyclopædia" "it is very timid, and when alarmed contracts itself forcibly, and then becomes remarkably brittle, so as to be easily broken in two by a blow or by an attempt to bend it. The name blind-worm has apparently originated in a mistake caused by the smallness of the eyes, which, however, are very quick and brilliant. Its food consists of slugs and insects, and it retires in autumn under masses of decayed wood and leaves or into dry soft soil." A friend of mine kept one in captivity for a considerable period, feeding it on earthworms. At the time I did not know that slugs were included amongst its diet, so that I was not interested in his strange pet, but now I intend procuring one as soon as possible.

In a well-known journal devoted to the fair sex a friend has pointed out to me the following paragraph under the heading of "Amateur Gardening":—"A very simple mode of slug catching has been suggested by a practical amateur, who declares it to be most efficacious. This is to place a few old saucers about in the borders, and pour into them early in the evening three or four tablespoonfuls of ordinary draught beer. The next morning the saucers will simply be crowded with tipsy slugs, which can be easily destroyed by pouring boiling water over them. If fowls are kept this disagreeable operation may be avoided, for the slugs will afford them a perfect feast, and the residue of beer will do them no harm." The italics are mine! I am not quite sure whether this "very simple mode" is really to be taken seriously. According to an amusing case which figured in a Scotch law court some time ago the effect of intoxicants on fowls is decidedly more degrading than one could possibly imagine.

The sum total of my experience with slugs is that hand picking with a lamp

at night is the only efficient way of dealing with them as far as hardy plants are concerned. Zinc rings and other contrivances are unsightly, and there is no pleasure in growing such plants, for instance, as *Cotyledon spinosa* and *Androsace sempervivoides* when their beauty is marred by an ugly piece of metal. My advice to anyone about to construct a rock garden or to make an herbaceous border is to put small heaps of bran on and around the ground it is proposed to lay out. Then pay several visits each evening to these heaps and collect all the slugs which in this way have been attracted, dropping them into a can of brine. The bran should be renewed occasionally, and after a while it will be found that all the slugs are caught. I know of no better way of ridding a piece of ground of these pests; it is both simple and inexpensive. The indiscriminate use of soot and lime amongst alpine plants is likely to do as much damage as the slugs themselves.

ARTHUR R. GOODWIN.

NOTES ON HARDY PLANTS

EREMURUS HIM-ROB.

MAY I be permitted to rectify a small error in your issue of the 20th ult., re the hybrid *Eremurus* described by your correspondent (see page 423)? The parentage given is not quite correct, as *E. himalaicus* has been the seed-parent, and not *E. robustus*. The name should read him-rob, not nimrob. In naming this plant, which was raised in Messrs. Van Tubergen's nurseries, I followed Sir Michael Foster's example, who advocates the system of naming hybrids by uniting abbreviations of the names of the parents. This system has the great advantage that with hybrid plants it at once reveals their parentage.

Haarlem, Holland.

JOHN HOOG.

AQUILEGIA GLANDULOSA.

THIS nursery is the headquarters of *Aquilegia glandulosa*, and has been so for a long time. It is one of my specialities—indeed, my only speciality in the flower way—for our nurseries

are mainly devoted to forest trees, ornamental trees and shrubs, fruit trees, Roses, &c. This *Columbine* is the only species grown here, so as to keep the strain pure.

This year my stock of plants flowered splendidly and are setting seed well, while last season I had also a good deal of bloom, but failed to get much seed on account, I suppose, of so much rain just at the critical time of setting. The two illustrations would have been more interesting if the photographs had been taken a couple of days or so sooner, as the flowers were past their best. The illustration of the single specimen represents the best flowering plant of this *Columbine* that I have ever seen or heard of. Before this specimen bloomed well-flowered plants might be had with from fifty to eighty blooms and buds; but the one illustrated had the enormous number of 153 flowers and buds in all stages of development. On the day it was photographed about fifty-six of the flowers were open, the remainder being buds in the various stages. The average diameter of the flowers is $3\frac{1}{2}$ inches, but this year I had many 4 inches to $4\frac{1}{2}$ inches across, and one measured 5 inches, but it was exceptional.

With us this plant neither has nor requires any special attention. It does not do much good in light or poor soil, thriving best in rich soil and that not liable to get dry in summer. Our present flowering plants are growing on peaty soil, and we get water 3 feet to 4 feet below the surface. Transplanted tufts will flower in beds where the seeds have been sown, but plants that have flowered for some years dwindle away. I think three year old plants that have been well grown flower most profusely, although they bloom well for years after.

Plants can be moved during open weather from the end of August to the end of April. Seed ripens about the first week of July, and that freshly gathered is best; and if sown at once—during July—it will germinate mostly the same summer and the remainder the

GROUPS OF *AQUILEGIA GLANDULOSA* IN MR. WISEMAN'S NURSERY, FORRES, N.B.

following year. If seed is kept over until the following spring after gathering it loses a deal of germinating power; so the best method is to get seed whenever ripe and sow it in the open at once.

W. WISEMAN.

The Nurseries, Forres, N.B.

LEWISIA TWEEDYI.

WE are pleased to illustrate this beautiful flower, and should be glad if readers would give their experience of it. It is somewhat tender as a rule, but the lovely colouring of the flowers is a full reward for any trouble necessary to get good results.

LYCHNIS CHALCEDONICA.

AMONG the old garden flowers we must place *Lychnis chalcedonica*, whose introduction by way

of the East, if we are to believe the records of the past, dates from the time of the Crusaders. As the author of "*Flora Historica*" says, it is more than probable that it was introduced into Europe in their day, "since we find so many of the Continental languages agree in calling it the Cross of Jerusalem—the French, *Croix de Jerusalem*; the Spaniards, *Cruces de Jerusalem*; the Italians, *Croce di Cavalieri*; the Germans, *Hierosolymorum flos*." Gerard speaks of it as common in English gardens in 1596, and he calls it the "*Flower of Constantinople*" and the "*Campion of Constantinople*." Its more common name in recent years has been simply that of the "*Scarlet Lychnis*," a term which expresses graphically, when we are aware of the supposed derivation of the name of *Lychnis*, said to come from one signifying flame or lamp, the flame-like appearance of the blossoms. When seen in certain lights our flower seems to be appropriately so named from the brilliancy of its

colour and the effect it makes in the garden. That it has long been a favourite need not cause surprise, as even in the summer months, when the garden is full of colour, this flower can well hold its own. If we are to accept common tradition and many authorities, the scarlet *Lychnis* comes from Russia, but the "*Index Kewensis*" gives Japan as its native place. It would be interesting to trace this old flower in the course of its wanderings until it found its way to our isles. It seems almost needless to describe it. Growing from 1½ feet to about 4 feet high, according to the nature of the soil and the cultivation it receives, it looks handsome with its stem-clasping, rather lanceolate leaves and the clusters of scarlet flowers which surmount the erect stem.

The typical plant with single flowers is easily raised from seeds or increased by division, and there are varieties with white and rose-coloured flowers in addition to the scarlet. It is, however, to its double-flowered varieties that the scarlet *Lychnis* mainly owes its popularity. The double scarlet is the most brilliant, and gives precedence to none of its compeers in its season. Scarcer and beautiful, if less striking, is the double white variety, which one seldom sees offered in a catalogue. It is said to have been a favourite with the Dutch, but it does not seem to have been known to Henry Van Oosten, whose "*Dutch Gardener*"; or, the *Compleat Florist*" lies before me as I write, and who speaks of only "one sort of double *Lychnis*." It has, however, long been known in this country, and is appreciated by some, though, personally, I should not compare it with the double scarlet for garden use. One may say the same of another double—the double rose—which I have not seen for years, and which must now be very rare.

The double varieties can be increased by division in early spring, though it is not always that increase by this simple method is possible from the absence of side growths. Sometimes, however, slips may be procured from the roots in autumn, but, failing these, propagation is best effected by making cuttings of the flower-stems before the flowers open in early summer. This process requires more care than can often be spared in these times, but it is the most certain way of raising a stock. The stems should be cut into pieces of three or four joints and inserted in light soil on a half shady bed or border, leaving only one eye above the surface. They should be watered so as to settle the soil about the cuttings, and then covered with a hand-light or glass, shaded from strong sun, until they root, which ought to be in from six to seven weeks, when some air may be given and they may be gradually exposed to the sun. These double varieties are worthy of this trouble and care. It is unnecessary to detail the raising of the single form from seeds, the treatment not differing from that of other hardy flowers. The scarlet *Lychnis* likes a warm situation in a rich but well-drained soil, and a group has a much better effect than a single plant. S. ARNOTT.

NOTES FROM A YORKSHIRE GARDEN.

MOSSY SAXIFRAGES AS EDGING PLANTS.

THIS particular Yorkshire garden consisted at first only of a portion of a field, with a concrete walk leading up to a new house. It was a question how best to obliterate as quickly as possible the stiff concrete edgings of the path and give a pretty setting to the herbaceous border that it was proposed to make. After preparing and planting the latter, the edging consisted for the first year of Pansies, and very gay they looked during the summer. But in winter the concrete edging was very bare and ugly, so in the following spring a number of mossy Saxifrages took their place, and have proved a great success during the four years they have been planted. Beautiful fresh green tufts greet the eye in autumn and winter, followed by masses of little flowers in spring, and all so easily grown and spreading so quickly. Perhaps *Saxifraga Rhei* with its rose-pink blooms is as charming as any, and close by is the rich red little *atropurpurea*, whilst muscoides and cæspitosa spread their white carpet of blooms in contrast to

LEWISIA TWEEDYI. (From a photograph by Miss Willmott.)

their fellows. There is no special order or arrangement of sorts; first one variety, then another, and sometimes two or three bosses of the same colour together, the general effect being very pleasing.

WALTER JESPER.

AN ARTIST'S NOTE-BOOK.

ASPIDISTRA LURIDA.

ASPIDISTRA LURIDA, with its leathery Palm-like leaves and quaint, dull-coloured flowers, that barely rise above the surface of the soil, would appear to be as widely removed as possible from the charming *Madonna Lily*, whose shafts of the purest white flowers form a delightful feature in many gardens, yet the two are closely allied, both being members of the extensive order *Liliaceæ*. Unlike most of its relatives, this *Aspidistra* is chiefly valued for the persistent character of its handsome shining leaves and the manner in which it adapts itself to adverse conditions, for as a window plant even in the smoky districts of London, the *Aspidistra*, known popularly as the Parlour Palm, will not only hold its own but flourish.

No description of the *Aspidistra* is necessary, as it is a well-known plant, but its curious flowers perplex many. They appear during spring, firstly in the shape of little knobs on the creeping rhizomes, which push their way just clear of the soil, increase in size, and ultimately expand. They are of a thick, wax-like texture, of a lurid purple when expanded, and have a curious Mushroom-like stigma. Despite their solid appearance they quickly fade. There is a widespread idea that if allowed to develop the flowers weaken the plant considerably, but there is really no foundation for this, as the effects, if any, are so infinitesimal as to be not worth consideration. China is the native country of the *Aspidistra*, and it was introduced from there in 1822. The variety with variegated leaves—which, when in good condition, is remarkably handsome—is almost as well known as the ordinary green-leaved form. In the "Kew Hand List" the specific names of *elatior* and *lurida* are given, but as generally met with in gardens the two are identical. A third species is also mentioned, viz., *Aspidistra typica*, which was figured in the *Botanical Magazine*, tab. 7484, July, 1896. From a foliage point of view it is not equal to the older kind, but is chiefly remarkable from the flowers being borne on particularly long pedicels, and being arranged in threes instead of fours as *Aspidistras* usually are.

H. P.

ROUND ABOUT A GARDEN.

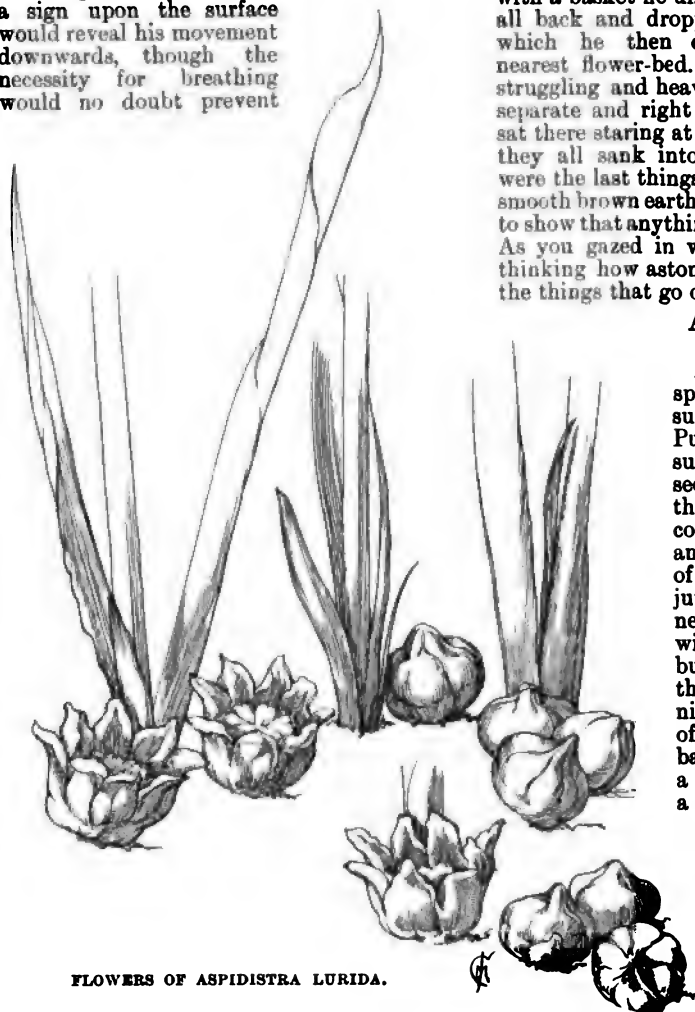

"TOAD IN A HOLE."

If you poke about the corners of a garden you will soon understand how the stories of toads imprisoned in solid rock arise. You hardly ever find a toad in its chosen retreat without wondering how it managed to get in, and how it proposes to get out again; and our ancestors enshrined this batrachian habit in the phrase "toad in a hole," as the name of a dish in which a piece of meat is baked inside a batter with no visible means of entrance or exit. I was reminded of this recently, when a box of young *Celery* plants was lifted from a mound of leaf-mould, on which it had been left for a day or two, and a large toad was revealed in the middle of the flat impression left by the box. His back was perfectly level with the

smooth surface, and he was exactly the same colour as the mould; and, as he exactly fitted the cavity in which he squatted, and there was no sign of the burrow by which he had entered, one might easily have taken him up in a trowelful of earth without noticing him. This peculiar faculty of the toad for burying himself without leaving a trace behind is due to his trick of burrowing backwards, as a crab does, his strong hind legs shovelling the earth forwards until he is covered.

AN INDIAN PARALLEL.

Even as I watched the toad he began to sink very slowly in the leaf-mould, with scarcely any perceptible movement, until he was quite out of sight under a thin layer of earth. After that, of course, it was only a matter for his own judgment how deep he should go for safety. Not a sign upon the surface would reveal his movement downwards, though the necessity for breathing would no doubt prevent

FLOWERS OF ASPIDISTRA LURIDA.

him from going far. In India you may see earth frogs performing the same feat with almost uncanny skill, although it is not often that you catch a glimpse of the evasive creatures at large, because they come out and feed only at night, lying buried in the ground through all the hours of daylight. It so happened, however, that in the compound of our bungalow there was a tennis lawn fenced on the side next the flower-beds with wire netting, with a mesh just large enough to allow the passage of the frogs on ordinary occasions. When the rains come, however, everything which can absorb moisture and eat insects becomes suddenly absurdly fat, because there are countless swarms of insects and water everywhere. Then, rising with the

dawn, you might observe a very curious spectacle on the margin of the tennis lawn.

THE VANISHING TRICK.

A large number of live tennis balls, as it seemed, were kicking with two long legs to force themselves through the wire netting; but if you looked on the other side of the netting you saw it fringed at the ground-level with the heads and fore legs of frogs, and the "tennis balls" on the other side were their tight round bodies, too compactly crammed with insects to get through by the way they had come. It was a terrible time for them, because at dawn the crows and dogs and all sorts of predaceous creatures are on the prowl for the night's leavings; but the *mali* (a native gardener) was the *deus ex machina* to help them out of their woe. Going down the line with a basket he unceremoniously hauled them all back and dropped them into the basket, which he then emptied—kerflop!—on the nearest flower-bed. After an instant of wild struggling and heaving, all the frogs squatted separate and right side up, and then, as they sat there staring at you with great goggle eyes, they all sank into the ground. Their faces were the last things to disappear, and then the smooth brown earth lay over them without a sign to show that anything had disturbed its surface. As you gazed in wonder you could not help thinking how astonishingly little one knows of the things that go on around one every day.

AN UNWELCOME GARDEN GUEST.

And an Indian garden is specially rich in zoological surprises. It was in the Punjab that the report one summer of wolves having been seen in the neighbourhood of the houses caused general concern and no small alarm among the natives on account of their children. The likely jungles in the immediate neighbourhood were drawn with mixed packs of dogs, but drawn blank; yet still the wolves were heard or seen nightly. Beyond the far corner of our large compound was a bathing tank and shrine, where a religious fair was held once a year, and close to this the irrigation channel for the garden was carried between banks several feet high. The rich soil in this corner of the garden bore a tangle of flowering shrubs—scarlet *Hibiscus* and a perfect thicket of *Lantanas*, orange, pink,

and white, weaving them all together into an impenetrable mass. This was a favourite haunt of many scores of kinds of glorious butterflies by day and hawk-moths at night; and there I was standing one evening, butterfly-net in hand, when a rustle made me turn, and within a few feet of me on the water-channel bank I saw, silhouetted against the sky for an instant, a huge wolf. Like a shadow it slipped noiselessly from sight, and next morning, when dogs were brought to the spot, the lair was found under the thicket of flowering shrubs, but neither of the wolves were at home. They had taken warning from our previous evening's meeting and were never seen again; yet many times before they must have listened to my footsteps passing close to them and have heard

the swish of the butterfly-net among the flowers overhead.

EVASIVE PARTRIDGES.

In England wolves need not be looked for "round about a garden," but unsuspected wild beasts may lurk there, nevertheless. For many months the ducklings of a village had been disappearing before the removal of a plank at the edge of a five-foot stream which skirted a cottage garden revealed the opening to an otter's hole. Here he was trapped; but the good wife was never afterwards able to stand with equanimity upon that plank to wash her dishes, lest another of the "fearsome beasts" should be lurking under it again. But for evasiveness in a garden a covey of partridges are hard to beat. Two weeks ago a partridge that was sitting in one of the shrubberies—where there is a nest every year—brought off seventeen chicks from her eighteen eggs, and the whole family of nineteen seldom, if ever, leave the garden. In the early morning a glimpse has been caught of them on the croquet lawn, and the gardener has once come upon them among the Cabbages; yet, though the garden is not large and some of the household move about it all day long, no other sign or sound of these nineteen birds has been observed.

INVISIBLE RABBITS.

There is known to be a rabbit in the garden, too, because twice during the last six months it has been disturbed from a patch of Snapdragons, but careful and repeated search with a terrier fails to reveal its hiding-place. But I have given up being surprised at what rabbits can achieve in the matter of invisibility. Last harvest two little baby rabbits were rescued from the "cutters" and placed in one of our small walled yards. When they were very young and foolish they were often seen to bolt into their little burrow when the door was opened. But by Christmas they had grown so wary that, although the yard is entered twenty times a day, and pigeons, doves, and ducklings are fed there, the rabbits have not been seen since, except one day recently, when we dug them out to make sure that both were alive and to ascertain whether they had children. They are both bucks, however; and there they seem likely to remain, regularly eating the food placed for them, but never once showing themselves, until they die of old age. And the invisible toads, rabbits, and partridges which a garden may contain are only a percentage of the zoological curiosities which everyone who takes over a piece of ground in the country has always upon his hands without knowing anything about them.

E. K. R.

GARDENING OF THE WEEK.

THE FRUIT GARDEN.

STRAWBERRIES IN POTS.

YOUNG plants intended for early forcing should be placed in their fruiting pots. Small pots 6 inches in diameter are quite large enough for the first batch, but for the general stock a larger size may be used with advantage. See that the fruiting pots are clean, dry, and well crocked, for much as the Strawberry enjoys a strong, rich soil, with plenty of moisture, it soon becomes unhealthy in a pot from which water cannot pass away freely. Pot the plants singly, with the crowns well above the soil, and place them on a hard surface in a light, airy situation. Avoid crowding the plants together or setting them near large trees, as it is important that the leaf-stalks be kept short and stout, and that good single crowns in preference to double ones be thoroughly

ripened before the autumn. Give water which has been exposed to the atmosphere, and keep the beds of concrete or ashes on which the plants are placed well moistened. Remove all weeds and runners. Apply lime water if worms are present, and rearrange occasionally to give more room and prevent the plants rooting in the ground. With many growers it is the practice to avoid the use of small pots altogether by filling the fruiting pots up to within three-quarters of an inch of the rim and then pegging or weighting the runners tightly on the surface. The drawback to this plan is the establishment of a colony of worms during the time the pots are standing on the quarters and the time occupied in watering in dry weather. The plants, however, make excellent growth, which ripens well, and the check which follows shifting from 3-inch to fruiting pots is avoided.

PEACHES.

When all the fruit has been taken from the early house go over the trees and remove shoots which have performed their functions and can now be spared with advantage to the young growths intended for next year's fruiting. Tie in and regulate the latter, allowing plenty of room for free development of foliage. Syringe regularly with pure water where the foliage is clean, and add soft soap or Gishurst Compound on dull evenings to keep it clear of spider. Keep the inside borders regularly supplied with water, and renovate the mulching where the trees show signs of weakness or exhaustion from heavy cropping, but carefully guard against forcing them into a vigorous growth when they should be going to rest. The ventilators may now be left open by night and day, and when the buds are plump the roof lights, if possible, may be taken off, painted, and stored away ready for use early in the autumn.

SUCCESSION PEACH HOUSES.

Peach trees in succession houses may now be given a higher temperature than would have been safe before the fruit commenced its last swelling. We prefer a temperature ranging from 60° at night to 75° by day, with plenty of air and full exposure by drawing the lights off when the weather is very fine after the end of June. Where good soft water can be obtained the trees may be syringed every morning until the fruit has attained its full size and shows signs of changing for ripening, but on no account should the afternoon syringing be performed when there is danger of the foliage remaining wet after nightfall.

Madresfield Court.

WILLIAM CRUMP.

KITCHEN GARDEN.

CARROTS.

Two distinct advantages are gained by sowing a good breadth of these at the present time; firstly, the young tender roots come in for kitchen use when the main crop are becoming too large to be used economically; and, secondly, the latter are not drawn upon whilst standing, but can be kept in reserve for winter use. Quite young Carrots of the Short Horn type are always much in request, and especially so in the autumn months. Select a partially shaded site for sowing this batch, and see that the ground is made firm and well watered the day before. Sow the seed thinly in shallow drills, and keep the bed sprinkled during dry weather to hasten germination. Thin out slightly when large enough, and encourage them to make quick growth by giving frequent waterings with clear water, and liquid manure applied alternately. Good varieties are Early Nantes and Carter's Favourite.

SHALLOTS AND GARLIC.

Generally speaking these become fit for lifting together, and they are in most localities now sufficiently ripe, and should be lifted and allowed to dry for a few days before storing. Should the weather be unsettled the bulbs must be put in an airy, cold frame, where they will soon mature.

TOMATOES AGAINST WALLS

in the open are now growing rapidly, and close attention must be paid to nailing or tying up the leaders and pinching out all side shoots as fast as

they appear; this is always necessary, and particularly so this year, for undoubtedly the season will be a short one. The same remarks apply to those planted in open quarters and staked. Feed frequently those plants that are fruiting in pots or boxes, and change the stimulant occasionally. A few days after applying an approved artificial manure the surface soil will be covered with white feeding roots, then is the time to apply a top-dressing of soil about an inch in thickness, I find the following mixture to answer well, viz., two parts loam, one of decayed manure, and one part made up of the following: bone-meal, mortar rubble, road grit, or river sand, a sprinkling of soot and Clay's Fertilizer, and some charred garden refuse. Incorporate well together and ram fairly firm.

WINTER GREENS.

If not already done the required number of plants of Brussels Sprouts, Kale, Savoy, and Broccoli should be put out without delay, as the plants will not have sufficient time in which to become strong and hard for passing through the winter. In gardens having light soil it is hardly possible to put Broccoli into too hard a plot of ground. The best Broccoli I have grown here were inserted with an iron bar on a worn-out Strawberry-bed. They were well watered in at the time of planting and twice afterwards, they were then left to take care of themselves without further attention beyond weeding.

Stoneleigh Abbey Gardens.

H. T. MARTIN.

INDOOR GARDEN.

PROBABLY the most useful Begonia for the early months of the year is B. Gloire de Sceaux, the young stock of which should by this time be potted up into 3-inch pots. I find that a compost of equal parts of loam and peat, together with coarse sand and charcoal, suits this plant better than one containing leaf-soil. Grow them in a warm pit or stove with plenty of moisture in the atmosphere, and give them slight shade during very bright weather. The small yellow thrip, so frequently alluded to, attacks this plant unless a sharp look-out is kept. Other winter-flowering subjects should be advanced as rapidly as is consistent with well built-up growth. Staking and tying must be attended to as growth progresses; let the object be to keep the plants as near to their natural habit of growth as possible, and give sufficient room to any plants growing rather freely.

BONVARDIAS

planted in pits now growing freely should have the points of the strongest shoots pinched out to bring the plants into a more uniform habit of growth without the necessity of tying.

POT ROSES

should now be arranged on the ash border. Personally I prefer to have them plunged in ashes, but where this plan is adopted the plants should be lifted once a fortnight to check any roots that may be growing through the holes of the pots, and if any be found trespassing in this way cut them off; the quantity and also quality of the Roses produced are entirely dependent upon the roots. Any plants requiring a larger pot should be attended to at once, otherwise they will not become sufficiently rooted before the winter, resulting in soft, unripened wood producing but few flowers, and those of poor form and substance. One other condition to guard against is the plants becoming water-logged. Where this is found to occur the plants must be lifted or the ash border drained. Rooted cuttings of

GARDENIAS

may be potted up, three plants in a 5-inch pot. In this way they will become bushy and compact by spring, and flower freely if grown on in a hot pit and plunged in a good bottom-heat. Campanula pyramidalis when grown in pots and now approaching the flowering stage will be much benefited by copious applications of clear liquid manure water. If allowed to become dry at the root at this period this Campanula frequently loses its foliage, and, consequently, much of its attractiveness. The present is a good time to sow a batch of

MIGNONETTE

to follow the outdoor plants, also to select a few dozen pots from them to grow on for training as standard or pyramidal forms for the early summer of next year. Pots 5 inches or 6 inches in diameter are the most suitable. Fill them with two-thirds loam, one-third leaf-soil, and one-eighth part of old mortar broken moderately fine, and place them in a cold frame until the seeds germinate.

Wendover.

J. JAKES.

FLOWER GARDEN.**BORDER CARNATIONS.**

TIME should now be found for mixing soil in readiness for layering these; leaf-soil should be the principal ingredient, with a liberal dose of common sand and enough old Mushroom-bed manure to help retain the moisture. If the layers are to be lifted in October, and the ground on which the present stock is growing is of a light nature, I would strongly advise pressing the ground firmly down with the foot. Given this treatment it will be found that the young plants have a tendency to keep at home in the new soil in which they are layered instead of running deeply, as they are apt to do if the soil is loose. The surface rooting is a decided advantage when they come to be lifted.

PINKS.

Cuttings of these may be put in now as time will permit; old frames or hand-lights will be found serviceable, as by their aid the young pipings can be shaded until they are on the move. It is almost impossible to have too many Pinks. Clumps and lines of them may be planted in many positions, and I would strongly advise all lovers of the Pink family to grow Mrs. Sinkins, Anne Boleyn, and Her Majesty in beds on a north border; by so doing they will prolong the flowering season. One rarely has too many Pinks; they take up very little room, make a fine show, and are always useful to cut from.

PANSIES.

Those who have never witnessed the display that can be produced by planting in beds or in masses the old-fashioned Cliveden Blue, Purple, White, and Yellow can form very little conception of it; and I am not certain that any other plants could be named that will produce such an amount of bloom at any season as these Pansies, in April and May particularly. If the plants were carefully lifted at the end of May or early in June from the flower garden and laid in rich soil in a shady place, having had all the more exhausted parts cut away and being kept watered to enable them to recruit their energies, they can now be divided into as many pieces as can be had with roots, and planted deeper than they were before in free rich soil. They are fond of well-rotted, hot-bed manure, and it should be used freely if fine, healthy plants are to be had. Planted thus and kept watered in a shaded situation they form plenty of fine healthy cuttings by the month of August, which root freely under hand-glasses in sandy soil; but those who have not even a hand-glass can root them behind a north wall, where the sun does not reach them.

AQUILEGIAS.

These are elegant plants and profuse bloomers, too rarely seen, although easily raised from seed. The long-spurred varieties are of great beauty and utility and good for cutting. Seed should be sown now in boxes of light soil placed in a cold frame. Sow very thinly, and when the seedlings are of a fair size transplant them to the place they are intended

to grow in. A moderately warm, dry soil suits them best.

T. B. FIELD.

Ashwellthorpe Hall Gardens, Norwich.

CHRYSANTHEMUMS.

THE work among these will now be full of interest, though not at all times of the most pleasant character, for there is yet much to contend with before the flowers are perfected, more especially when one intends entering into friendly competition on any given date. The heavy rainfall experienced in many parts of the country kept newly-potted plants in a very saddened condition for some days, and unless means were taken to ward off some of it many of the weaker plants will have suffered considerably. We have registered here for June nearly 6 inches, but fortunately our plants had been potted rather earlier than usual, and were, therefore, better prepared to receive it than if this had just been performed. The advantage of thorough drainage will have proved its value, especially during such a season as the present, though at all times it is unquestionably most important, so also is the arranging of the pots on boards rather than on ashes. During spells of very wet weather it is a capital plan to raise the pots on two short pieces of lath, thus allowing the water to pass away freely.

FEEDING.

By the time these lines are in print the plants will have used up most of the manure placed in with the soil, and will need further stimulating. Some are content to wait till the bud is formed before resorting to manure, but in my opinion this is certainly a wrong method. At the same time during the bud formation feeding should be very cautiously done, which will mean in about a month or six weeks' time. No plant enjoys a change of food more than the Chrysanthemum, and few things in the way of manure, providing they are judiciously used, will come amiss to them. Good Peruvian Guano when it can be procured is certainly one of the best, but requires to be used with caution. Farmyard liquid manure, when it can be relied on to contain nothing injurious, well diluted is also excellent, but the safest and one of the best methods is to mix up fresh horse and cow manure in equal proportions in a large vessel. Add a bag of soot to it and replenish when exhausted. Good patent manures are best applied during showery weather. The surface soil should be stirred up often but not sufficiently deep to injure the young feeding roots on the top. Many of the varieties are now forming what is known as the July bud, and these should be removed as quickly as possible. Three shoots will generally break away. These should all be retained for a short time, finally

selecting the strongest and best and removing the other two, where three growths have been already made, thus securing three flowers to each plant. The leaf miner has been most troublesome this year. It has inflicted considerable damage upon the under foliage, where the leaves are badly disfigured. These should be removed and the others carefully looked over, removing the maggot with a pointed stick. After this date this will probably cause little further trouble. Watch closely for earwigs, and trap and destroy them.

E. BECKETT.

Aldenham House Gardens, Elstree.

WATER LILIES.

THE cultivation of beautiful and highly coloured Water Lilies is no new thing in England, as many suppose. They were magnificently grown at Chatsworth in Sir Joseph Paxton's time, forty or fifty years ago, and are so still. The great Victoria Regia and Water Lily house there, by its light construction and the means of providing moderate heat in the atmosphere and water, is an ideal home in which to grow these plants, and with due deference to the merits of the hardy hybrids introduced of late years, I have no hesitation in saying that for stateliness of growth, brilliancy of colour, quality of flower, and sweet scent they are not to be compared with those well grown under glass. I mention this only in order to place the fact before your younger readers that these beautiful flowers have been grown in many English gardens for a long time before the hardy hybrids were introduced from France and America. In those days they could only be enjoyed by the few on account of the expense incurred in their culture under glass. Now, thanks to the enterprise of our American and French hybridists, they may be had by all who possess a garden, or even a sunny back yard large enough to hold a tub of water.

As the culture of Water Lilies becomes better understood, and the price of the best varieties decreases, their cultivation in every garden and park will be the rule. The most common way of growing these Lilies up to the present seems to be in tanks and tubs. I must say that they are not seen to the best advantage when grown under such conditions. They are too much restricted, and are far more attractive when growing in tanks and ornamental waters. Four years ago I had the privilege of planting

NYMPHÆA GLORIOSA IN A POOL.

a number in the large lake at Frogmore House, Royal Gardens. Some were planted at a depth of 2½ feet or more (I mention this as many are under the impression they will not succeed when planted so deep); to each plant a small cart-load of turfy loam and manure in equal proportions was given. The plants were first planted in shallow wicker baskets in the same material, and sunk securely in the heap of soil. They have succeeded remarkably well, and under those conditions seem to grow as freely or more so than the common white one. They delight in rich soil, and the strong growing varieties should be lifted and divided every three or four years, the divided plant often making from eight to a dozen plants for replanting. In this way a large surface of water may be covered in a comparatively short time by these beautiful flowers. From the middle to the end of April is the best time for dividing and replanting.

VARIETIES.

Among the bright crimsons and reds, for robustness of growth, size of flower, free flowering, and rich colour I would place *Gloriosa* (shown in the accompanying illustration) in the first position; *Carnes* is also a vigorous grower, very free flowering, light pink in colour, and deliciously sweet; *Ellisiana* also grows well, flowers freely, and is one of the most handsome, a brilliant red in colour, with bright orange stamens; *Falconeri*, intense crimson in colour, leaves and flowers of medium size, which, however, are freely produced; *Laydekerii rosea*, as its name implies, is a light-coloured variety of pleasing tints of rose, pink, and flesh colour; *Robinsoniana*, dark rose, of moderate growth, and very floriferous; *Marliacea ignea*, intense crimson in colour, one of the most effective as regards colouring, flowers of medium size, and growth moderate.

Among the yellows *Chromatella* is one of the very best, the colour pale canary yellow. It is a strong grower, almost a perpetual bloomer, flowers of immense size, often 8 inches in diameter. They are produced on strong stalks well above the water. *Helveola* is of medium growth, flowers rather small, canary yellow in colour, and richly perfumed; *Flava*, a pretty yellow, of moderate growth, and very free.

Of the whites *Marliacea alba* is perhaps the best, flowers of noble size, the colour pure white, and requires plenty of space, as it is a vigorous grower; *Odorata*, one of the handsomest of the whites, is deliciously scented, the tips of the petals tinted with pink; *Pygmea* is a little gem, miniature in growth and size of flower, colour of the purest white, and suitable for growing in tubs. Unfortunately, so far we have no blue hardy Water Lilies. Let us hope that before long a hardy *stellata* or *zanzibarensis* may be forthcoming.

Those who wish to enjoy the feast of colour that Water Lilies are capable of giving should visit them in the morning or midday. They are not seen to advantage in the afternoon and evening.

OWEN THOMAS.

RECENT PLANT PORTRAITS.

THE *Botanical Magazine* for July contains portraits of

Senecio clivorum.—A native of China and Japan. This is also known under the synonym of *Ligularia clivorum*. It is certainly one of the handsomest of all the herbaceous species of the genus, producing bunches of large orange flowers on tall stems. It will form a conspicuous ornament of the wild garden, and is specially suited for the brink of ponds and other moist places.

Helleborus lividus.—Native of Majorca. This plant was figured in the *Botanical Magazine* so far back as 1789, but so inaccurately that it is now considered necessary to give a correct portrait, together with its full synonymy and its native country, which was unknown when the first figure was published.

Iris lupina.—Native of Armenia. This is one of the *Oncocylus* or Cushion section of the family, and is known to the natives as Wolf's Ear, which accounts for the name given to it by Professor Sir Michael Foster, who first introduced it to cultivation. It is nearly allied to the old and well-known *I. susiana*, figured on t. 91 of the *Botanical Magazine*.

Huernia concinna (syn. *H. macrocarpa*).—Native of Somaliland. This small-flowered stapeliaceous plant is of only botanical interest.

Calothamnus rupestris.—Native of Western Australia. This is one of twenty-two species of a family of curious and more or less handsome flowering shrubs, all of them natives of South-Western Australia. The flowers have no petals, but consist of a number of brilliantly-coloured stamens issuing from a furcate, greenish white calyx, which retain their beauty for quite three weeks. The specimen figured was flowered in the Cambridge Botanic Gardens and sent to Kew by Mr. Lynch, the curator.

The first number of the Paris *Revue Horticole* for July figures

Protea Mellifera.—A native of the Cape and of Australia, where it is known as the Honey Flower or Sugar Bush, from the abundance of sweet nectar afforded by its large and handsome flowers.

The July number of the *Revue de l'Horticulture Belge* figures two well known but beautiful greenhouse shrubs from New Holland, under their old name of *Genetyllis fusioides* and *tulipifera*. They are also known under the name of *Hederoma* and *Darwinia*.

W. E. GUMBLETON.

NURSERY GARDENS.

ROSES AT CHESHUNT

MESSRS. PAUL AND SON'S beautiful display of Roses at the Holland House show, combined with a cordial invitation from the head of the firm, Mr. George Paul, to "come and see them growing," were the inducements held out to me to pay a visit to the Old Nurseries on the 27th ult. Of course, it was too early to see in bloom the majority of the Teas, Hybrid Teas, and Hybrid Perpetuals, which had been severely checked by the cold and inclement weather of the previous fortnight, although here and there some of the earlier varieties had a few flowers expanded. Many of the so-called garden Roses were, however, magnificent, and alone amply rewarded me for my visit. Pride of place must be given to

ROSA RUGOSA REPENS ALBA,

which, it is worthily claimed, is, so far, the finest garden Rose introduced this century. Words fail me in attempting to describe the exceeding beauty of this variety at Cheshunt. The original plant was measured by Mr. G. Paul in my presence, and was found to cover a space of no less than 160 square feet, and when I go on to say that it is simply the white *rugosa* with the habit of *Rosa wichuraiana*, and that it bore thousands of stellate flowers and had many thousands of buds to follow, some slight conception can be formed of this truly magnificent novelty. My advice to any rosarians who are in the neighbourhood of London is to go and see this fine plant for themselves, when they will find that I have in no way exaggerated. Mr. Paul told me that it originated in a batch of *rugosa* seedlings, and, although it is almost impossible to trace any

wichuraiana blood in it, I learn that Mr. Baker considers it must have originated through a chance cross with the latter species. The plant forms a perfect thicket, some of the growths being pendent and some prostrate, while it rivals *R. wichuraiana* in its scrambling habit. As a standard it is still more remarkable, and is, I think, seen even to greater advantage, because the graceful and floriferous shoots droop down to the ground, where they will soon layer themselves if allowed to do so. The long rows of standards of this variety were all in bloom at the time of my visit, and were, indeed, a sight to behold. I have never seen more beautiful weeping standards, even among the new *wichuraiana* varieties. Of course these latter were well represented, and where all are good it is really invidious to select. However, my choice falls on

RENE ANDRE AND ALBERIC BARBIER

as being the best varieties with which I have made acquaintance so far. What a wealth of treatment these Roses lend themselves to. We may use them for tumbling over a sunk fence, draping a bank, festooning a low terrace wall, or falling over the surface of a large rock; indeed, there is scarcely any limit to the uses to which we may put them. In this garden we are using them as a carpet to shrubs, and Mr. Milburn has planted them over some blocks of weathered oolite stone in the Botanic Garden. At Cheshunt René André planted on a raised mound, was superb in its bright orange-red blossoms, and it is a great gain that these Roses should be so easy to flower. Alberic Barbier is just the variety to plant with the last-named, as its coral yellow flowers and deep yellow buds form a happy contrast. The walls of Roses prove one of the most conspicuous features at Cheshunt, and some of them were just at their best, particularly *Una*, *The Wallflower* (most named, in that it blooms from the top to the bottom of its shoots and makes a perfect carpet of rosy crimson flowers), *The Lion*, *Carillon*, *Pillar*, and *Leuchstern*. A group of the *R. bon Purity*, in spite of the fact that it is one of those which was badly cut by the frost, was covered with fresh white blossoms, and *bed of Royal Scarlet*, the brilliant crimson single Hybrid Perpetual, displayed how effective this variety is for bedding.

LADY BATTERSEA

has already attained great popularity—indeed the demand for this variety exceeds the supply—and if planted rather thickly makes a splendid bed. The blooms are produced on such long stalks that the size of the plants is considerably diminished when they are cut the full length, and one only wishes that it possessed a somewhat stronger habit of growth. Unfortunately, it does not form a good standard. Undoubtedly the Rose for this latter purpose is

FRAU KARL DRUSCHKE.

Its bold, vigorous shoots soon form a splendid head, and Mr. Paul is justly loud in its praises. Another variety which makes a standard of remarkable beauty is *Tea Rambler*. I did not care for the forced examples of this Rose exhibited at the Temple show, but it is splendid as I saw it in the open. A long row of two year old standards were literally beset with the coppery salmon-pink blossoms, which will please the most fastidious. They are very fragrant, of pretty shape, and have the merit of remaining long in bloom. Although the foliage is Tea-like, the plants appeared to be very hardy, and had scarcely suffered in the least from the past trying winter and spring. François Crousse is another variety which

nakes an excellent standard. Only a very few of its flowers were expanded, so that I was not well able to judge as to its merits, but in colouring it is not as good as Noella Nabendland. I was exceedingly pleased with the new Dijon Tea, England's Glory, and it is likely to become very popular in the near future, as it is very free and should prove hardy.

Needless to say, large beds of seedlings of all kinds are on trial, as well as new varieties from home and continental raisers. Five new varieties with which Mr. Paul is especially pleased are H.P. Ben Cant, H.T. Lady Moyra Beauclerc (lake and silvery pink, very lasting), H.T. M. Lede (bright rose, with yellow base), H.T. Franz Deegen (a yellow Caroline Testout), and H.T. Mme. Edmée Metz (salmon-pink, mildew-proof, rather like Mrs. Edward Mawley).

Space will not allow me to describe a tithe of what I saw, and I have therefore only jotted

M. v. Leopoldii.—Very distinct, the flowers deep rose, the lip having a large deep maroon blotch at the base.

M. v. leucoglossa.—Sepals and petals pale rose, lip pure white.

M. v. superba.—This has dark rose-pink sepals and petals, the lower sepal streaked with red-purple near the base, lip large, carmine-rose, with a triangular purplish red blotch, banded with white at the base.

M. v. sanderiana.—The flowers of this are large, sepals rose, shading to white, the lateral two having crimson dotted lines near the base, the petals and lip rose, the latter having a blood-red blotch at the base.

M. v. memoria G. D. Owen.—A splendid form, flowers large and richly coloured, petals and upper sepal bright rose, lower sepals rose, with a broad bar of crimson-purple on their lower halves, lip rose, with a dark crimson-purple disc.

M. v. chelensis.—Very distinct. The flowers of medium size, sepals and petals rose, the two lower ones lined with purple at the base, the lip is rose, with large purple blotch at the base, with radiating

the plant then being transferred to a 5-inch pot, and thus developed two bulbs in 1902, one of them producing two young growths. The other one, and this the present season, 1903, developed three large bulbs, each producing three spikes, bearing in all forty-three blooms.

Now that the majority of plants have passed out of bloom they should be placed at the coolest end of the cool intermediate house (some growers place them in the cool house during summer). When this is done they should be put at the warmest and cosiest end, the ventilators not opened so as to cause draughts, and given sufficient water only to keep them plump and healthy until the young growths are well on the move. It is then necessary to repot, or it may be left until a later period when the young growths have further advanced and new roots issue from the base. The subject of the accompanying illustration was grown in peat moss and leaf-soil in equal parts, the whole being well mixed together. This *Miltonia* also grows well entirely in leaf-soil (if proper discretion is used in watering the plants), with one crock over the bottom of the pot, Fern roots laid to the depth of about an inch, and over these a thin layer of sphagnum moss. The leaf-soil should be pressed moderately firm, working in a few crocks among it, and finishing off with a layer of fresh sphagnum moss. A temperature of 60° by night and 65° to 70° by day throughout the year will grow *Miltonia vexillaria* and its varieties well. F. W. THURGOOD.

MILTONIA VEXILLARIA VAR. KAISERIN AUGUSTA IN THE GARDENS OF ROSSLYN, STAMFORD HILL, N.

own a few impressions of my visit to this home and birthplace of the queen of flowers. Worcestershire. ARTHUR R. GOODWIN.

ORCHIDS.

MILTONIA VEXILLARIA AND ITS VARIETIES.

FEW Orchids are more beautiful or more showy than *Miltonia vexillaria* and its numerous varieties. Many of the latter are very distinct and even showier than the species. The following are some of the most distinct:

M. v. alba is, as its name indicates, pure white, with the exception of a faint rose tinge at the base of the sepals and petals. *M. v. Queen Alexandra* has extraordinary large white flowers, the base of the segments very faintly tinged with rose.

M. v. cobbiana.—The sepals and petals are rose-pink, margined with white, lip large and pure white.

lines, dotted with purple and margined with white.

M. v. gigantea.—The flowers are very large, deep rich rose throughout, disc of the lip rather bright yellow.

The typical *Miltonia vexillaria* is not merely beautiful, but also most useful. It is a fine Orchid for exhibition, and suitable for cutting and arranging in vases or other decorative purposes. I have seen many dining-room tables magnificently decorated principally with this lovely flower. It is one of the freest to bloom, one of the easiest to grow, and never requires a high temperature, thus making it a most suitable Orchid for amateurs. The accompanying illustration represents a variety known as *Kaiserin Augusta*, a handsome form, the sepals and petals of which are deep rose, the two lower sepals being lined with purple at their base. The lip is large, deep rose with a large purple blotch at base, and margined with white. The illustration fully represents the remarkable way the plant increases when grown under suitable conditions. When bought, in a 3-inch pot, in July, 1901, it had two small bulbs with one lead. When growth commenced a double break was produced,

system of culture of the grower in question is as follows:—Early in October the cool houses are planted with Cabbages raised from seed sown the first week in the previous August, the land being manured and dug in the ordinary way. Little or no attention is necessary until cutting commences early in April, continuing until May, when all the crop has been disposed of. When we come to consider and realise the demand for, and the importance of a good supply of tender Cabbage so early in the year, we cannot wonder that the plebeian Cabbage is thus grown.

Immediately the Cabbages are disposed of, trenches are dug out 4 feet apart and 18 inches wide, into which some new soil and a moderate dressing of manure are placed, digging all together some time before planting. A double row of plants, at 10 inches apart, is planted in this trench. When the plants have established themselves and are well furnished with fruit, the ridge between the trenches may be levelled into these as a top-dressing for the plants. Heavy crops of fruit are secured in this way at comparatively small cost—watering, collecting, and marketing the fruit being the chief items of labour. In December the

KITCHEN GARDEN.

TOMATO CULTURE UNDER GLASS WITHOUT FIRE HEAT.

ACRES of glass are devoted to Tomato culture, with no artificial heat, in the islands of Guernsey and Jersey, but the conditions there are more favourable than is the case in Britain. Still, this system is carried out on a large scale in many of the suburbs of London. I have visited one where twenty houses, covering ten acres of land, were utilised by Tomatoes. Each house covers half an acre of land, ten of them are heated with hot water, and ten not heated at all. Both the heated and unheated houses produce two crops a year; the heated ones producing two crops of Tomatoes, and the unheated ones a crop of Tomatoes and one of Cabbages. It will be news to many of my readers, I have no doubt, to hear that Cabbages are grown under glass by the acre in England. The

Tomatoes will be almost over, and it will be time again to plant the Cabbages. The reason for adopting the plan of growing in trenches is that deep digging and a change of soil for the crop are thereby assured; the ground that forms the trenches one year will form the ridges next, and so on. The stronger the plants when planted out at the end of April and early in May the better will be the result. Seeds are sown the last week in January. Comet is the only variety grown at the establishment in question.

The method adopted in the ten houses, which were heated, covering 5 acres, is different. Here all the plants are grown in pots, the first fruits ripening from April until June. The pots are then filled with other strong young plants, and they in their turn will yield heavy and remunerative crops until late in the autumn or early winter, when it is no longer remunerative to grow English Tomatoes by virtue of the heavy importations of fruit supplied from abroad at a cheap rate. The seed for the earliest crop is sown the last week in October, the plants are grown during the winter in 5-inch or 6-inch pots, and potted into their fruiting pots (12-inch) about the middle of February. The seeds for supplying the second lot of plants, planted at the end of June, should be sown the first week in April. All are grown on the single-stem system, the stems being stopped when 4 feet high. The reason for this is that the best fruit is formed on this part of the stem.

When the same crop follows continuously upon a limited area of land it is not surprising that growers are, before long, confronted with land sickness, and as a consequence the plants show diminished vitality, are liable to disease, and consequently unremunerative; then we see the advantage of the pot system of culture, where fresh soil can be given to each plant. Two heavy crops during the summer can also be had from pot plants, and this cannot be easily accomplished under the planting-out system. An abundance of water is most essential to successful Tomato culture under glass, and therefore an ample supply must be secured. One economical method is to build a tank at the lower end of the block of houses into which all the rain which falls on the roofs may drain. A tower will have to be built (on which to fix the tank), high enough to give the necessary pressure for expeditious watering. A pump worked by hand, or by whatever power decided on (this will depend on the size of the establishment), would have to be fixed for pumping the water to the top of the tower. It need scarcely be said how much better in every way, and how much more conducive to the success of garden crops of all sorts, is rain than spring water. Therefore, means should be provided to save all that falls upon the roofs. When this supply is inadequate, and no other source available, a well must be sunk.

A. P. H.

SOCIETIES.

NORFOLK AND NORWICH ROSE SHOW.

THIS annual fixture, held in the grounds of Carrow House and Carrow Abbey, by permission of the Misses Colman and Professor J. Stuart on the 2nd inst., was a decided success. The weather was all that could be desired for such an event. Four large tents were requisitioned for staging the exhibits, and these were well filled. The Rose classes were in many cases not so good as one could have wished, but, taken collectively, the blooms were much better than those staged the previous year.

The Colchester growers—Messrs. B. R. Cant and Sons, D. Prior and Son, and F. Cant and Co.—secured all the prizes in the order named in the chief open classes. The Rev. A. Foster-Melliar of Sproughton, the Rev. A. L. Fellowes of Shotesham, and the Rev. John Fellowes of Bunwell maintained the reputation of the clergy as lovers of Rose culture and successful exhibitors. The Rev. Foster-Melliar came out well as a prize winner, and likewise secured the National Rose Society's medal for the best bloom other than a Tea with a fine bloom of the new Lady Moyra Beauchamp. Mr. Reginald Steward of Saxlingham was the fortunate medal winner for the best Tea with a good bloom of Mrs. Edward Mawley.

Miss Penrice of Wilton House again secured the silver challenge cup for the best twenty-four distinct varieties grown in Norfolk. Good stands which secured prizes in other classes were set up by Mrs. H. S. Patten (Cringford), Colonel Rous (Westead), Major Danby, and Messrs. T. C. Blofeld and B. E. Fletcher.

Miscellaneous cut flowers made the boldest display of all, and the herbaceous flowers were in grand condition. The premier stand in this section was a collection of forty-eight bunches, staged by Mr. George Davison, gardener at Westwick House. The massive bunches were grandly arranged, and the freshness of the blooms was much commented upon by the spectators. The same exhibitor was also first for twelve bunches of flowering shrubs. Mr. P. Wright, gardener to W. J. Birkbeck, Esq., Stratton, Strawless, was also a winner in the herbaceous section, and a dozen bunches of the clear-eyed Sweet Williams, from the same grower, were admired by the old-time florists. The scholars at Crooks Place Board School, Norwich, who have a portion of the public park, which, under the able guidance of that enthusiastic gardener and botanist, Mr. Edward Peake, grow many charming blooms, had made an effective display.

Another rather unique exhibit, labelled "Not for competition," was a miniature rock garden of British native plants of low growth made by Mr. H. Dobbie, Pinebanks, Thorpe. Mr. Dobbie is a keen follower of native botany and plants, and his Orchids, Grasses, and Mosses, all locally grown, were most interesting. Pot plants filled another tent, and some grand Ferns and Coleus, staged by Mr. W. Rush, gardener to F. P. Hinde, Esq., Thorpe, were worthy of comment. Fuchsias, Begonias, Pelargoniums, Coleus, and Caladiums came from the gardens of Colonel Rous, Dr. Osburne, E. G. Buxton, Esq., T. Chaplin, Esq., T. Glover, Esq., H. Skelton, Esq., and W. J. Birkbeck, Esq.

In the fruit section, Mr. W. Allan, Gunton Park, was first for a collection of fruit, first in all four classes for Grapes, first for Melons, and first for Peaches. Mr. P. Wright, gardener to W. J. Birkbeck, Esq., was first for Strawberries and Nectarines. Mr. T. Glover, gardener to Mr. Craddock, was also a winner for Grapes. Mr. Fitch, Dunston Hall Gardens, was also a meritorious exhibitor in this section as well as flowers.

Vegetables were not quite up to the standard, though fairly good Peas, Cauliflowers, Cucumbers, and Lettuces were staged, some of the most notable prize winners here being Colonel Rous, G. F. Buxton, Esq., Mrs. Lubbock, Major Petre, F. P. Hinde, Esq., F. Martin, Esq., and Mr. F. Carrington.

Messrs. Daniels Brothers, Limited, Norwich, put up a charming bank of flowering and foliage plants, containing new and choice specimens of Heliotropes, Hydrangeas, Crassulas, Palms, Ferns, &c.

Hobbles, Limited, Dereham, made one of their pretty displays. In the centre of their stand they had formed an arch of Dorothy Perkins Rambler Rose, surrounded at the base by the newest H.T.'s. There were also Sweet Peas, Pelargoniums, and other amateurs' flowers in profusion.

The receipts for admission reached £155 2s., over £50 in advance of last year.

PORTSMOUTH.

ON the Clarence Pier, Southsea, the Portsmouth Rose show was held on the 1st inst. under favourable circumstances, and was successful in every respect. If Roses were not numerous they were good in quality.

The principal class was that for forty-eight distinct single blooms. Three competed for the substantial prizes offered. Messrs. D. Prior and Sons, Colchester, won the coveted award somewhat easily. Beattie Brown, La France, Margaret Dickson, Gustave Pigeau, Mme. G. Lisset, Maman Cochet, and Marquise Litta were the best. Mr. G. Mount, Canterbury, was second with smaller yet richly-coloured blooms. Messrs. Rogers and Son, Southampton, were third.

For twenty-four trebles, distinct, Messrs. Prior again won with an even set of blooms. Especially good were A. E. Williams, Caroline Testout, Mrs. John Lasing, Marquise Litta, Helen Keller, Kaiserin Augusta Victoria, Ulrich Brunner, Antoine Elvire, and Souv. d'un Ami. Mr. Mount was second.

For twelve Teas, distinct, Messrs. Prior were unapproachable, so even and good in quality were their blooms, particularly Devonienita, Edith Gifford, Souv. d'Elise Vardon, Medea, The Bride, and White Maman Cochet. Mr. Mount was second, and Messrs. Rogers were third.

For twelve H.P.'s, dark, Messrs. Prior again won, staging A. E. Williams and Prince Arthur in capital form. For twelve H.P.'s, light, Messrs. Prior also won with extremely fine blooms of Mrs. J. Lasing and Marchioness of Downshire.

For twelve Teas or Noisettes, Messrs. Prior could not be beaten, so superior were their blooms of Mrs. E. Mawley, Ernest Metz, The Bride, and White Maman Cochet. Mr. Primall, gardener to Mrs. Cecil, Ryde, was second in the last-named class with creditable flowers.

Garden Roses were grandly staged by Mr. G. Ellwood, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, in the class for eighteen bunches distinct. The names were Papa Gontier, Mme. Eugène Besal, Leuchstern, Mme. Planter, Gustave Regis, Common China, Gloire de Mousseaux, Cheshunt Scarlet, Follenberg, Felicite Perpetue, Moschata alba, Gloire des Polyanthes, Wallflower, Queen Alexandra, Psyche, Euphrosyne, and General Butriei.

Mr. Druce, gardener to J. R. Winthrop, Esq., Ryde, was a good second, staging Macrantha extremely fine.

Hardy cut flowers were grand. Six competed for twelve bunches, distinct. Mr. Leek, Burstead, Isle of Wight, was first, Mr. Ellwood second, and Mr. Prince third. Bouquets were beautifully displayed by Mr. E. Willis, florist, Southampton, who won for both ball and bridal bouquets.

READING ROSE SOCIETY.

WE hope that this newly formed society has begun a prosperous career. Its first show, in spite of the weather of the preceding few weeks, was a very interesting and pretty one, and the sunshine brought together a large company. We congratulate the hon. secretary and treasurer, Mr. W. L. Walker, upon the success of his endeavours. The judges were: Open classes, Mr. Dickson, Newtownards, County Down, and Mr. Prince, Longworth, Berks; amateur class, the Rev. F. Page-Roberts, Stratfieldsaye Rectory, and Mr. Colin

Romaine, The Priory, Old Windsor; decorative class, Mrs. Murray, Perival, Ryde, Isle of Wight, and Mr. Woodward.

In the local classes the exhibits were good throughout, some of them being very fine. Mr. R. C. Mount of Laleham secured first place in the local amateurs' class, with a beautiful lot of blooms, including Claire Jacquier, Turner's Crime Rambler, the old Almede Vibert, Felicite Perpetue, and Reine Marie Henriette. Mr. Dunlop of Malmesbury, Berks, was a splendid second, the former exhibit being a little more artistically arranged.

In the open class for nurserymen, Messrs. Alexander Dickson and Son gained the blue ribbon with some lovely blooms, among which were Mildred Grant, Beale Brown, Caroline Testout, Mrs. W. J. Grant, and Souv. d'un Ami, President Carnot.

The Rev. F. Page-Roberts of Stratfieldsaye Rectory was awarded first honours for the best Rose in the local class with Comtesse de Nadailac.

Mr. T. Rigg of Caversham was a very successful exhibitor. With four entries he carried off four firsts and two seconds. In Class 3 (open to all), for twelve single trusses, as a variety, the judges had no hesitation in placing him as Beattie Brown, one of his flowers in this class, also gave the National Rose Society's medal for the best bloom in a show. In Classes 6, 7, and 8 Mr. Rigg also distinguished himself, carrying off highest honours with equally beautiful blooms.

Mr. W. Conway Jones was first in the amateur class for twenty-four distinct single trusses, and so was he given by Mrs. G. W. Palmer. His was a very brilliant display, comprising the leading varieties. The cuttings were a fair feature, but a little more artistic taste might have been displayed in this direction. The baskets and vases of flowers were attractive; this is a branch which should be encouraged. Flowers so arranged look far better than those displayed on boards.

Among the honorary exhibits must be mentioned that of Mr. Edward Hudson, The Deansy Garden, Sonning, garden Roses, arranged in "Munstead" bowls and glass. The variety Killarney was very beautiful.

Messrs. Cuthbush and Sons' display of Carnations, Marguerites, Verbenas, Palms, &c., was also a new feature in one of the tents. Mr. Robert Symonds of Birmingham also had a splendid exhibit of Carnations tastefully arranged.

During the afternoon Mrs. Benyon (the president) distributed the cups, and on the proposition of the Rev. H. Chasles, seconded by Mr. Strange, was accorded a hearty vote of thanks.

RICHMOND HORTICULTURAL SOCIETY.

THIS society held its twenty-ninth exhibition in the Deer Park on the 1st inst., and, favoured with pleasant weather, it is not surprising that the show, from the horticultural point of view at least, was an unqualified success. The management of the exhibition was in the capable hands of Mr. C. R. King, the honorary secretary, and a capital of practical working committee, which left nothing to be desired.

Forty-eight Roses, distinct, three blooms of each, which the Gunnersbury Park Challenge Cup, with £10 money, was the first prize. This was secured by Messrs. B. R. Cant and Sons, Colchester, with a fine lot of blooms, the best being Ulrich Brunner, Ellen Willmott, Margaret Dickson, Killarney, Medea, Gustave Pigeau, Beattie Brown, and others. The second prize was secured by Messrs. D. Prior, also of Colchester. Messrs. Frank Cant and Co. of Bralwick Rose Gardens, Colchester, took the third prize.

In the class for twenty-four varieties, three blooms of each, Messrs. Frank Cant and Co. took the leading place, having notable blooms of Souv. de Pierre Notting, Souv. d'un Ami, President Carnot, Mrs. Grant, and Cleopatra.

Messrs. Frank Cant and Co. also secured the leading place for twelve varieties, three blooms of each, some of the best flowers including Tennyson, Mildred Grant, Kaiserin Augusta Victoria. For twelve blooms of a variety only, Messrs. Frank Cant and Co. came first, staging Frau Karl Druschki in capital form, the second prize being awarded to Messrs. D. Prior and Sons, Colchester, who had fine blooms of Mme. Gabriel Lisset.

For twelve Tea Roses of one variety Messrs. D. Prior and Sons and Frank Cant and Co., both of Colchester, took first and second places respectively, each firm staging Souv. de S. A. Prince in capital form. In the amateur class for twenty-four Roses, distinct, Mr. W. C. Romaine, of Windsor, was placed first, having Margaret Dickson, Gustave Pigeau, and Beattie Brown very good. The same exhibitor also secured first prize in the class for twelve blooms distinct.

A splendid group of cut blooms of Malmesbury Curlew came from Mr. J. P. Morgan, Dover House, Rochester (gardener, Mr. McLeod). The varieties were Old Blush, Princess of Wales, and the rich crimson kind, Mr. E. Jones. The yellow Cecilia was also staged, the entire post attracting much attention throughout the day.

Of exhibits of the amateur class we were strongly impressed with that of the Rev. A. W. Owen, Old Palace, Richmond, who showed Lillium auratum in pots as fine as we have ever seen it.

Hardy flowers in the amateur classes were finely shown by the Earl of Dysart, Peterham, and by Mrs. E. L. Fitch, Peterham House, and took first and second prizes respectively. The class was for twenty-four bunches of hardy herbaceous things, bulbous plants being admissible. The usual seasonable flowers were well shown, and in some bunches.

Hardy flowers were extensively staged by Messrs. I. I. Ware, Limited, Feltham, who had masses of Campanula Moerhousii (pure white), Delphiniums, Oriental and other Poppies, Water Lilies, Lilies, &c. In another group the same firm staged an admirable lot of Roses in small pots.

In the classes for vegetables, usually a strong one at Richmond, little competition was offered to Lord Aldborough.

istree (gardener, Mr. E. Beckett), who took the first prize for a collection of vegetables both in the open class and in that for the best display of vegetables, nine distinct kinds, forced by Messrs. Carter and Co., High Holborn.

The group of Orchids from Sir F. Wigan, Bart., Clare town, East Sheen, contained excellent examples of Cattleyas, Laevocallis, Odontoglossum crispum, and others, with specimens of the Rex section as of a very suitable margin.

For a collection of fruit, not less than nine dishes, the first prize is Lady Max Wachtel's Challenge Cup and £3 10s. a money, was taken by Earl Dysart, Ham House. For Black trapes, Sir F. Swinford Eady, Weybridge (Mr. J. Locke, gardener), was first, the same exhibitor taking the lead in White Grapes. The same exhibitor also took the leading place for Peaches and Nectarines.

Mr. C. Fordham, Twickenham, had a very fine group arranged in the grass for effect.

Mr. J. Russell, Richmond, had a large exhibit of Crotons, Juncos, Aralias, Dracenas, Palms, Ixoras, and such-like things in profusion, occupying a large space. In the open he same firm showed a most complete arrangement of the tree Ivy, green and variegated, silver and gold in great variety.

Mr. Isoton, Putney, showed Palms, Lily of the Valley en masse, with Hydrangea paniculata grandiflora. A capital group.

A group of Palms was a most commendable item from Mr. J. Bruckmans, Twickenham, giant Kentias and Arecas prevailing, interspersed with Acers and other plants.

Messrs. W. Fromow and Sons, Chiswick, had a very telling group of Japanese Acers, with Bamboos, Aralia pentaphylla, and a fine lot of Kalmia latifolia laden with delicate pink flowers in profusion.

Some magnificent specimen Fuchsias were shown by Mr. Sallows, Twickenham, the fine plants averaging some feet in height, and perfect in foliage and blossom.

Mr. W. Thompson, Sheen Nurseries, Richmond, had a group of Crotons, Palms, Acers, Pandanus Veitchi, Spiraea almita, with Plumbago capensis, and other things.

Mr. Leopold de Rothschild, Gunnersbury, sent fine examples of blue Water Lilies, such as Nymphaea gigantea and N. W. Stone, the handsome flowers being much admired.

WINDSOR AND ETON ROSE.

THROUGH the gracious permission of His Majesty the King, the society held its twelfth annual show on the slopes at Windsor Castle on the 4th inst. It would be difficult to imagine a more suitable place in which to hold a flower show than this beautiful part of the grounds at Windsor. The classes were not so well filled as formerly, owing, no doubt, to the indifferent season, which caused the society to alter the date a week later.

There was keen competition in the open class for the Queen's Cup, forty-eight distinct single trusses. Messrs. Harkness and Co. were a splendid first, with grand blooms.

La France, Le Havre, Alfred K. Williams, Jean Ducher, Mildred Grant, Star of Waltham, Helen Kellar, and Mrs. J. King. The latter bloom was given the silver medal for the best one in the show. Messrs. D. Prior and Sons were a good second with splendid Kaiserin Augusta Victoria, Mrs. J. King, Marie van Houtte, and Ulster; third, Messrs. B. R. Cant and Sons.

Eighteen Teas distinct: Messrs. D. Prior were first with a even stand. Souvenir de Pierre Notting, The Bride, nocente Pirola, Cleopatra, and Mrs. E. Mawley were a best blooms. Messrs. Frank Cant and Co. were second with good Rubens, The Bride, and Mme. Ravary; third, Messrs. B. R. Cant and Sons.

For twelve distinct (three trusses of each): Messrs. Alex. Jackson and Sons were first with a grand lot of well-built flowers. Mildred Grant, Mrs. J. Laing, and Robert Scott, are splendid. Messrs. Harkness and Co. second, with red Beattie Brown, Caroline Testout, and Mrs. J. Laing. Messrs. D. Prior and Sons were third.

For twelve single trusses of any H.P. or H.T., Messrs. Frank Cant and Co. were first with a lovely stand of Mildred Grant; second, Messrs. A. Dickson and Sons with Beattie Brown; third, Mr. Thomas Riggs with the same variety.

For twelve single trusses of any Tea or Noisette, Messrs. Prior and Sons were first with a splendid lot of Maman Cochet. There was only one entry in the class for eighteen inches of garden Roses, and this was won by Charles Turner Slough, with a very attractive exhibit in which were Mrs. F. Ducher, Mme. A. Chateau, Marquis de Salisbury, me. Charles, W. H. Richardson, and L'Idéal.

AMATEURS.

For thirty-six distinct single trusses: First, Rev. J. H. Pemberton, with a nice even lot, including Caroline Testout, Mrs. W. J. Grant, Tennyson, Killarney, Duchess of Albany, and Laurence Allen; second, Mrs. Hayward; and Mr. W. C. Romaine third.

Six single trusses, one kind: First, Rev. J. H. Pemberton, with Beattie Brown; second, Mrs. Hayward, with Her Majesty; third, Mr. G. A. Hammond.

Twelve Teas or Noisettes: First, Mr. A. Munt, with well built flowers of good colour, including Maman Cochet, Cleopatra, Princess Beatrice, and Anna Olivier; second, Mrs. Hayward; third, Mr. G. A. Hammond.

Six distinct, three of each: First, Rev. J. H. Pemberton; second, Mr. F. Wellesley; third, Mrs. Hayward.

Twelve bunches of garden Roses: First, Rev. J. H. Pemberton; second, Mrs. Irving.

Twenty-four distinct single trusses: First, Mr. R. Foley Hobbs, with good Beattie Brown, Maman Cochet, Alice Randsall, and Ulster; second, Mr. F. B. Gabriel; third, Mr. C. Romaine.

Twelve distinct single trusses: First, Mr. F. Wellesley, with a grand stand of White Maman Cochet, Caroline Testout, and Maman Cochet; second, Mr. G. A. Hammond; third, Mr. R. Foley Hobbs.

LOCAL CLASSES.

In the class for eighteen distinct single trusses (the Windsor Cup is given to the winner of this class), Mr. W. C.

Romaine was first, and he having won it three successive times it now becomes his property. He had a splendid stand, including Mrs. J. Laing (good), Maman Cochet, Duke of Albany, and A. K. Williams; second, Mr. J. B. Fortescue; third, Mr. A. F. Govett.

For twelve distinct single trusses: First, Mr. A. Munt; second, Mrs. E. Thomas; third, Mrs. Bulteel.

For six trusses of any H.T. or H.P., Mr. A. L. Wigan was first with Kaiserin Augusta Victoria; second, Mr. J. B. Shackie, with same variety; third, Mr. A. Munt, with Beattie Brown.

For six trusses, any Tea or Noisette, Mr. A. Munt was first with White Maman Cochet (splendid); second, Mr. J. B. Fortescue, with Mme. Cusin; third, Rev. J. B. Shackie, with Anna Olivier.

For six bunches of garden Roses, distinct: First, Rev. J. B. Shackie, with a charming lot, including Crimson Rambler, W. Allen Richardson, and Macrantha; second, Mrs. Irving; third, Mr. A. Green.

For the best display of cut Roses, Mrs. Irving was first with a very charming display, and won the Duchess of Sutherland's Cup outright for this; second, Mr. F. Baxter; third, Mr. W. H. Austin.

For best basket of Roses, Miss Violet Gee was first with a pretty arrangement; second, Mrs. Baxter; third, Mrs. Green.

For best dinner-table decoration, Mrs. Davies was first with a charming arrangement of Iceland Poppies and Gypsophila.

For a group of plants, Mr. A. F. Govett, took the leading award in this class with a nicely arranged group of Crotons, Francoa, Schizanthus, Caladiums, &c.

FRUIT.

was very poorly represented, but vegetables were very plentiful and of good quality. Messrs. Wallace and Co. had a grand display of hardy flowers. Messrs. Jones and Son, Shrewsbury, had charming Sweet Peas arranged with Gypsophila and Grasses. Mr. Charles Turner, Slough, had a very extensive display of hardy flowers, Roses, and Fuchsias. Messrs. Litt and Son, Windsor, had a pretty arrangement of floral designs.

HARROW HORTICULTURAL SOCIETY.

FEW people are aware that the Harrow Horticultural Society was established so long ago as 1853, yet such is the case, and it is still doing good work in the neighbourhood for the encouragement of gardening. The annual exhibition was held on Tuesday last (July 7), in the grounds of Dudley Lodge, by kind permission of J. MacAndrew, Esq., and although the gale of the day before had damaged some of the flowers there was a very good display of Roses especially. Messrs. D. Prior's first prize exhibit of thirty-six blooms, was as good as we have seen this season. In addition to the numerous Rose classes, which were well filled, miscellaneous hardy flowers, fruits and vegetables, added to the attractiveness and interest of the show. One tent was entirely devoted to Ladies' exhibits, the chief of which were those competing in the class for dinner-table decoration. There were no less than ten displays of this description, and, being unusually well arranged, they were really one of the best features of the show. At the lunch given to the committee, judges, and other officials, Mr. Lewis Pawle said how much they were indebted to Mr. E. Mawley and Mr. George Paul for their valuable help on many occasions. Several of the visitors spoke of the great pleasure it gave them to visit the Harrow Show, where, thanks to the efforts of Dr. A. H. Williams, Mr. F. Spencer (honorary secretaries), and Mr. Lewis E. Pawle (honorary treasurer), everything worked so well, and they met with so hearty and hospitable a reception. Mr. Mawley referred to the practice of mossing the boxes instead of using green painted lids, and he was glad to see that it was disappearing. He also made the suggestion (which we think the committee would do well to carry out), that this society should be called "The Harrow Rose and Horticultural Society."

OPEN CLASSES.

Thirty-six Roses, distinct: First, Messrs. D. Prior and Son, Colchester, with an excellent lot. Beattie Brown in this stand won the National Rose Society's silver-gilt medal for the best bloom in the show, given by Dr. Williams. Other lovely blooms in this exhibit were Mildred Grant, White Maman Cochet, Prince Arthur, Souv. de Pierre Notting, Mrs. J. Laing, and Robert Scott. Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester, were second. Frau Karl Druschki, Tennyson, General Jacqueminot, Mrs. J. Laing, and Mme. de Watteville were the best blooms. The third prize fell to Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester. Comte de Raimbault, Mrs. Edward Mawley, and Souvenir d'Elise were the best. The Harrow Horticultural Society's Jubilee Challenge Cup, presented by the Ladies of Harrow (to be won three years in succession), goes with the first prize. Messrs. B. R. Cant and Sons won it in 1902.

Twelve Roses, distinct, Tea or Noisette: First, Messrs. D. Prior and Son, Colchester, with a very pretty stand that included Jean Ducher, Mrs. E. Mawley, The Bride, Maman Cochet, Golden Gate, and Ethel Brownlow, all good. Second, Messrs. Frank Cant and Co., Colchester, with Mrs. Edward Mawley, Lady Roberts, Ethel Brownlow, and Comtesse de Nadailac in really good condition. Osmund G. Orpen, Esq., West Bergholt, Colchester, was third, Mme. Hoste, Cleopatra, and Bridesmaid being finely shown. There were several more entries in this class.

Twelve bunches of garden Roses, distinct: Messrs. Paul and Son, Cheshunt, were the only exhibitors, and won the first prize. Camoens, Marquise de Salisbury, Mme. Ravary, Gustave Regis, and Liberty were very pretty bunches.

AMATEURS.

Twenty-four Roses, distinct: First, E. B. Lindsell, Esq., Bearton, Hitchin, who thereby won the cup given by Lewis S. Pawle, Esq. Comtesse de Nadailac, Beattie Brown, La France, Mme. Cusin, Mrs. J. Laing, Mrs. Grant, and S. M. Rodocanachi were the best of a beautiful lot. O. G. Orpen,

Esq., West Bergholt, Colchester, was second with an exhibit of less uniform quality. The best blooms were Mme. Eugene Verdier, Bridesmaid, White Maman Cochet, and Mildred Grant; third, E. Mawley, Esq., Berkhamstead, whose finest flowers were Mrs. Grant, Marquise Little, and La France.

Twelve Roses, distinct, not open to exhibitors in the preceding class: First, Arthur Munt, Esq., Hedgerley, Slough, with good blooms, the pick of which were Mrs. Grant, Maman Cochet, and La France. W. G. Adcock, Esq., The Briars, North Finchley, was second, Gustave Piganeau and Captain Hayward being finely shown; third, G. A. Hammond, Esq., Burgess Hill, Sussex. His Killarney was a lovely bloom.

Twelve Roses, distinct, Tea or Noisette: First, Rev. F. R. Burnside, Stanbridge Rectory, Essex. White Maman Cochet, Mrs. Edward Mawley, Muriel Grahame, and L'Innocence Pirola were the best blooms in a fairly good exhibit. Osmund G. Orpen, Esq., was second with Mme. Hoste, Catherine Mermot, and Medea as the best; third, Arthur Munt, Esq., Hedgerley, Slough. Mme. Cusin was the best bloom.

MEMBERS OF THE SOCIETY.—GARDENERS' DIVISION.

Twelve Roses, distinct: First prize and National Rose Society's silver medal were won by Lewis S. Pawle, Esq. Antoine Riviere, Beattie Brown, Kaiserin Augusta Victoria, and Maman Cochet were the best blooms. Dr. H. A. Williams, Rotorua, Harrow, was second. Mrs. Sharmar Crawford, S. M. Rodocanachi, Margareth Appert (a well-formed, large, rose-coloured bloom), and Maman Cochet were his finest flowers; third, J. R. Cater, Esq., Kaiserin A. Victoria and Medea both being good.

Six Roses (distinct), not open to exhibitors in preceding class: First, Frank Spencer, Esq., with some beautiful blooms. One of Mildred Grant on this stand won the National Rose Society's silver medal for the best Rose in members' classes. White Maman Cochet, Clara Watson, Tennyson, and Lady Clamorris also were well shown. Second, Arnold Mitchell, Esq.; third, L. R. W. Forrest, Esq.

Six Roses, Tea or Noisette: First, Frank Spencer, Esq., who again showed well, Jean Ducher, White Maman Cochet, and Mrs. Edward Mawley being excellent; second, Dr. H. A. Williams, whose blooms were rather smaller. Catherine Mermot, Bridesmaid, and L'Innocence Pirola were, however, all well shown; third, J. R. Cater, Esq.

Four Roses of any one variety: First, Frank Spencer, Esq., with very good White Maman Cochet; second, Arnold Mitchell, Esq., with Caroline Testout; third, Lewis S. Pawle, Esq., with Mrs. Sharmar Crawford.

Three vases of Roses, three blooms of each: First, Frank Spencer, Esq.; second, A. S. Hargreaves, Esq.; third, Dr. A. H. Williams.

Four bunches of garden Roses: First, A. S. Hargreaves, Esq., whose best vaseful was W. A. Richardson (beautiful colouring); second, Dr. A. H. Williams; third, S. Gardner, Esq., who showed rugosa and other single Roses.

AMATEUR MEMBERS.

Six Roses, not more than two of one sort: First, A. Bryans, Esq., H. Schultheis and Killarney being the best; second, Mrs. Burton. Prince Camille de Rohan was a lovely bloom, also Cleopatra; third, Mrs. O. G. Holmes.

Vase of Roses: First, A. J. Obermayer, Esq.; second, Captain Johnson.

COTTAGERS (MEMBERS ONLY).

Six Roses, distinct: First, Mrs. Whitfield, with several good flowers; second, Mr. W. Mower; third, Mr. J. Allen. Group of plants: First, Mrs. Charles (gardener, Mr. T. Norman).

Four Begonias: First, A. S. Hargreaves, Esq., with very creditable plants.

CUT FLOWERS.

Collection of cut flowers (prizes given by Lady Northwick): First, S. Gardner, Esq., who showed Iceland Poppies, Gallardias, Eschscholtzias, Sweet Peas, and other bright flowers; second, A. S. Hargreaves, Esq., whose group included some English Irises, Lychnis chalcidonica, Canterbury Bells, &c; third, Mrs. Charles.

Twelve bunches of cut flowers: First, Rev. E. C. E. Owen; second, E. Graham, Esq.; third, Lewis S. Pawle, Esq., all very bright.

Six bunches of cut flowers: First, E. W. Howson, Esq.; second, G. B. Innes Hopkins, Esq.; third, Arnold Mitchell, Esq.

Twelve bunches of Sweet Peas, distinct: First, Lewis S. Pawle, Esq., the best varieties being Miss Willmott, cocinea, and Duke of Westminster; second, J. A. Stuart, Esq., with a very pretty lot also; third, Mrs. Charles.

Six bunches of Sweet Peas: First, A. E. Carlyon, Esq.; second, G. B. Innes Hopkins, Esq.; third, E. W. Howson, Esq.

The first prize for six spikes of Delphiniums was won by Arnold Mitchell, Esq. Lewis S. Pawle, Esq., was second; and E. Graham, Esq., third.

Mr. Henry Eckford, Wem, Shropshire, showed an admirable display of Sweet Peas in many lovely varieties. Messrs. Paul and Son, Cheshunt, sent hardy flowers; Mr. J. Lion, Stanmore, Middlesex, showed Caladiums, Delphiniums, and New White Royal Pelargonium Mrs. J. Lion.

Messrs. James Taylor and Sons, St. Hilda's Nursery, Harrow, exhibited miscellaneous plants; Messrs. W. Cutbush and Sons, Barnet Nurseries, and Highgate, N., showed an attractive display of Sweet Peas, Roses, and Carnations, both Malmesdon and tree varieties. There were numerous exhibits of fruits and vegetables.

LADIES' DIVISION.

Dinner-table decoration.—The first prize was won by Miss Evelyn MacAndrew with a very pretty arrangement of pink Gladioli, pink Centaureas and Gypsophila. Miss O'Neill was second with a simple—yet unusually effective—table of light purple Sweet Peas in the centre, and dark ones at each corner. The third prize was won by Mrs. Arnold Mitchell, who used Cornflowers, Teasel, Gypsophila, but there was

a preponderance of greenery. There were numerous other entries.

Mrs. Peringer was first for an arrangement of flowers in a vase, showing Roses.

Miss Evelyn MacAndrew won the first prize for a collection of cut flowers, arranged in a basket, with English Irises and Scabious, all of various shades of purple.

In the class for an arrangement for centre of dinner-table, Roses only, (open to amateurs within 25 miles of Harrow), Miss Beatrice Langton was first, with a lovely display of Apricot and yellow-tinted flowers.

ROYAL HORTICULTURAL SOCIETY.

THERE was a very small meeting of the society on the 7th inst., but the groups shown were interesting, and in some cases very beautiful.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), Messrs. Charles T. Drury, Geo. Nicholson, John Green, J. F. McLeod, James Huisson, J. Jennings, Wm. Howe, G. Reuthe, Chas. Dixon, H. J. Cutbush, Geo. Gordon, H. J. Jones, R. W. Wallace, Charles E. Pearson, Charles E. Shea, W. P. Thomson, E. H. Jenkins, and Amos Perry.

Hardy flowers were well shown on this occasion, some important groups being staged by the leading growers of these plants.

Mr. M. Prichard, Christchurch, Hants, set up a good lot of perennials, among which we were pleased to note the somewhat scarce double white sweet-scented Campon, *Lychnis vespertina plena*, good masses of *Alstromerias*, *Galegas*, *Delphinium Belladonna*, *Potentillas* (very fine), *Lychnis haageana*, many *Gallardias*, *Lilium Brownii*, *Water Lilies*, &c.

Messrs. T. S. Ware and Co., Feltham, made a speciality of *Delphiniums* on this occasion, and of these showy July flowers there was certainly a goodly array, quite informally arranged.

Some fine *Eremuri* were also shown, among which we noted *Sybil*, orange-yellow, said to be a cross between *E. Bungei* and *E. Warei*, and *E. Wycliffe*, a strong yellow, broad in petal, and said to result from the crossing of *E. Warei* and *E. Olize*.

Crotons from Mr. H. B. May, Edmonton, were in some 120 distinct varieties, and in their groundwork of Maidenhair Fern made a fine display of colour. The plants were mostly small examples in 5-inch or 6-inch pots and quite representative of all sections of this fine decorative group.

Messrs. J. Peed and Sons, Norwood, showed a group of *Carnations*, *Malmsons*, and border varieties in pots, intermingled with each other.

Carnations were also finely shown by Messrs. W. Cutbush and Son, Highgate. Of those shown we noted *Monk*, a very fine scarlet; *Maggie Hodgson*, crimson; *Valleta*, bluish; *Thora*, also bluish; *Don Juan*, crimson, fine petal; *Queen of the Isles*, yellow ground; and others.

Messrs. William Bull and Sons, Chelsea, showed a beautiful lot of *Anemochilus* and allied things, as *D. vestina*, *Hemaria*, *Goodyera*, &c. Of these *Dosinia marmorata* was very fine. The group was surrounded by small plants of *Eugenia myrsiphylla*, a dainty shrub-like plant very dwarf in stature.

Messrs. Wallace and Co., Colchester, showed, as usual, hardy cut flowers in great quantity. Some of the things were exceedingly showy, notably *Eremurus Bungei*, a rich yellow-flowered plant. *Iris laevigata* in variety was also in strong force, and so too *Iris spuria alba*, &c. The *Calochorti* from this firm are always very beautiful, and from this standpoint there is no variation. *Liliums* were good and numerous, particularly so being *L. Brownii*, *L. tigrinum* in variety, *L. azovizianum*, all very beautiful. *Iris Monnierii*, rich yellow, is also a fine border plant now in season.

The *Roses* from Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, were a capital lot, especially good being the pure white *Frau Karl Druschki*. Mrs. Edward Mawley, Mildred Grant, Papa Lambert, deep pink of exceptional size and form; *Duchess of Portland*, fine creamy white; Mrs. B. R. Cant, deep rose-pink; and *Souv. de Catherine Guillot*, deep apricot, were among the best. *Blush Rambler* was also finely shown, and, indeed, is one of the best of its class.

Sweet Peas from Messrs. J. Cheal and Sons, Crawley, were very good, and included the leading sorts now grown.

Hardy flowers from Mr. E. Potten, Cranbrook, Kent, included *Inula glandulosa*, *Potentillas*, *Delphiniums*, *Iris Monnierii*, *Gallardias*, *Campanulas*, &c. *Iris ochroleuca* was also very fine.

Small Cactaceous plants and allied things were again shown by Mr. E. Anker, Baker Street. There were many species grouped together.

Verbena Warley was well shown by Miss Willmott, Warley Place, Essex. It is a fine scarlet variety, of a vigorous constitution, the colour exceedingly showy.

Mr. Amos Perry, Winchmore Hill, showed hardy plants in fine condition, and with a rare lot of *Water Lilies* in trays made a most effective exhibit. Of these latter we noted *N. Laydekeri rosea*, *N. ellisiana*, *N. Marilacea chromatella*, *N. M. carnea*, *N. Gladstonei*, *N. Wm. Douglas* (a grand white), *N. Marilacea alba* (very fine), &c.

Campanula rhomboidalis, a rich blue, was finely staged. It is a capital dwarf border plant. *Heuchera sanguinea* Walker's variety is certainly the finest of all this race, rich in colour and large in bell.

Messrs. James Veitch and Sons, Chelsea, showed *Malmson Carnations* in grand style; the plants perfect in health and vigour. A few of the best are *John Coles*, scarlet, fine; *Robert Burns*, red-scarlet; Mrs. Trelawny, Mrs. Grimston, rosy flaked bloom; Sir Charles Freemantle; Lady Rose, deep rose-pink, one of the gems; *Maggie Hodgson*, crimson; *Nautilus*, flesh; *Albion*, rose; and *King Oscar* being among the best.

Some pots of *Lilium Marham* in variety were shown by Miss Willmott, Warley, Essex.

Shrubs from Messrs. Veitch included *Eucallonia phillipi*, white flowers, *Cytisus nigricans*, golden; *Stuartia Pseudo Camellia*, cupped, white flowers; *Cytisus schipkaensis*,

creamy flowers; a group of *Rhododendrons* of the *java jasmminiflorus* group was also shown.

Carnations of the border type were shown by Mr. James Douglas.

The Rev. W. Wilks, Shirley, showed his much improved strain of *Shirley Poppies*, a group embracing the greatest beauty and many shades of colour.

A group of *Campanula peregrina*, together with a large collection of *Sweet Peas* in pots, from Messrs. James Veitch and Sons, Limited, attracted much attention. These latter were grouped in triangular fashion, three pots of each, and about 3 feet high.

Messrs. Barr and Sons showed a small group of cut flowers, the chief of these being the early *Gladoli*, of which a large variety was set up. *Iris laevigata* in variety and with *Water Lilies* were also from the same firm.

Nymphaea mooriana, from Australia, was shown by Mr. Leopold de Rothschild, Gunnersbury House (gardener, Mr. Hudson). It is yellow-flowered, and, we presume, not hardy.

AWARDS.

The following received an award of merit:

Campanula peregrina. —

This is a showy biennial species of some worth as a flowering plant for the conservatory. The flowers are bell-shaped, pale blue to violet-blue in colour, the ovary being encircled, as also the base of the corolla, with deepest violet-blue. The flowers are arranged in a dense spicate raceme 2½ feet high. The plant is much branched from the base, thus enhancing its decorative value. The species is a very old one, and long known to gardeners. Shown by Messrs. J. Veitch and Sons, Limited, Chelsea.

Carnation Diadem. — A well formed flower, with light yellow ground and rose markings and stripes. The flower is beautifully formed.

Carnation Merlin. — A yellow ground bloom of large size, with bordering of heavy crimson. Both these were from Messrs. Wm. Cutbush and Son, Highgate.

Nephrolepis cordifolia cristata congesta. — This dwarf interesting Fern is fully described, or at least broadly so, in its name. The fronds are some 6 inches long, as shown, the parts apparently congested or closely arranged together. Shown by Mr. H. B. May, Edmonton.

LIST OF MEDALS.

Silver-gilt Flora. — Messrs. J. Veitch and Sons, and Mr. H. B. May, Upper Edmonton.

Silver Flora. — Messrs. R. Wallace and Co., Colchester.

Silver Bankian. — Mr. M. Prichard, Hants; Messrs. T. S. Ware and Co., Feltham; Messrs. B. R. Cant and Sons, Colchester; Miss Willmott, V.M.H., Warley; Mr. J. Peed, West Norwood; and Mr. A. Perry, Winchmore Hill.

* * The reports of the Sutton Rose Show, Croydon Flower Show, and the Royal Horticultural Society's Orchid and Fruit Committees are unavoidably held over.

OBITUARY.

MR. WILLIAM THOMPSON, V.M.H.

WITH much regret we have to record the death, on Friday, the 3rd inst., of Mr. William Thompson of Ipswich, in his 81st year. It is not too much to say that the whole horticultural world—not that of England only—knew and honoured Mr. Thompson. His wide knowledge and unfailing kindness were always at the service of enquirers, while those who knew him as a friend knew how good a friend he was. His position in horticulture was one by itself. His wide botanical studies were reflected in his seed catalogue, always the most interesting of any to the intelligent amateur. In the lists of others of the most eminent seed firms might be

THE LATE MR. WILLIAM THOMPSON, V.M.H.

found varieties of garden flowers carried to big and more special development; but people know that, allowing for errors that must creep into list of such wide comprehensiveness, Thompson was entirely to be depended on.

We desire to record to his honour that in other tradesman's list do we remember to have seen appended to the name of a plant: "This I cannot recommend." The seed in question of some half-hardy annual commonly called but Mr. Thompson had reason to doubt the quality of the batch that had that year come into hands. The same thing may have been observed in the interesting supplementary list seeds of new or special plants. When seed offered of plants unknown to him he passed on description he had received, but was careful to say that he had not himself tested it.

The following from the *East Anglian Daily Times* is of interest:

"Mr. Thompson, who leaves a son (Mr. Sid Thompson) and three daughters to mourn his loss, had resided in Ipswich all his life. He married Miss Fisher of Yoxford, who predeceased him in 1884. As a young man, the deceased gentleman was always deeply interested in science, began by studying chemistry and photography and was one of the earliest pioneers of the Daguerreotype method of photography. After time his health began to fail him a little, and turned his attention to botany, his pursuit of science being at the outset purely a hobby. Little by little he began the exchange and sale of seeds, and he published his first catalogue in 1855.

His speciality was always herbaceous and alpine plants. Through many correspondents in all parts of the globe he was gradually enabled to introduce to the English gardening world a large number of plants hitherto not brought into cultivation.

"The deceased was a man of wide interests, great reading, marvellous memory, and an extremely good linguist. He was of lovable disposition, and displayed an old-world courtesy, combined with entire simplicity of character." Mr. Thompson was a Victoria Medallist of Honour.

The Midland Carnation and Plootee Society will hold its usual annual exhibition on Thursday and Friday, August 6 and 7, which is later than usual, owing to the season.

The Royal Horticultural Society's gardens as an open space for Chiswick.—There is considerable heart-burning in Chiswick over the society's gardens. Some consider their purchase a wise move, others that it is just the spot for a new technical school, but it does not seem at all clear that the council of the society have even parted with them. Whatever their future is to be there is a decided opinion that they should be preserved as an open space.

National Dahlia Society.—A meeting of the committee will be held, by kind permission of the Horticultural Club, in the club-room at the Hotel Windsor, Victoria Street, S.W., on Tuesday, the 21st inst., at 2 p.m. Business: 1. Election of judges for London and Manchester shows; 2. Advertising the London exhibition.—P. W. TULLOCH.

The 1903 Sweet Pea Show.—Evicted from the site of their former yearly displays, the National Sweet Pea Society will hold their third grand exhibition at London's popular resort, Earl's Court, on the 15th and 16th inst. On both days the spacious Prince's Hall at the Warwick Road entrance, picturesquely arrayed with countless varieties of the Sweet Pea from all parts of the kingdom, will be open entirely free to visitors to the International Fire Exhibition. In addition to the numerous prizes offered in the recognised classes, the National Sweet Pea Society's silver medal will be given for the finest novelty of the year.

Bamboos flowering.—I saw your notice of the Bamboo A. Simoni being in flower. I wonder if it is as troublesome as my two large plants of A. S. variegata. These for three years have refused to do anything but flower and seed for about eight months in the year. This year they began soon after Christmas, and there is not a culm that is not crowded with old and young seed-pods. I send you a bit of both to see. You will notice that the later flowering has resulted in plenty of seed set. I did not send any larger quantity as it is not beautiful. The plants now look like ragged bundles of old straw; there must be pints of seed, yet only a leaf here and there. I send one of the largest branchlets, but it shows the variegation. I have never known tender and half-hardy shrubs, also Bamboos, in such rampant growth as this year, and the dry heat that we are now suffering from will, at any rate, ripen the wood, and so do good, but we are parched up.—A. BAYLDON, *Oaklands, Dawlish, Devon.*

I have here a quantity of Bamboos, which this year are covered with inflorescence. Only one is in flower, which I think may be Simoni, but I am not very clear as to the different forms. It would be interesting to know whether the flowering of this Bamboo is general throughout the country this year, also to observe whether the seed will ripen in this climate.—R. M. GREAVES, *Wern, Portmadoc.*

Rhubarb The Sutton.—For a great number of years I have taken much interest in Rhubarb, chiefly to get an early variety with sticks of good colour that does not run to seed quickly. My note on this occasion refers to The Sutton, and so far it is much superior to any variety I have grown. I force large quantities of Rhubarb, and I have given most sorts a trial with excellent results, both in the open ground and in the forcing pit. This variety much resembles the Victoria,

but is earlier and scarcely produces a seed. The colour is a bright rich red, and this is retained even in a cooked state, and the roots even when forced in a dark Mushroom house give well coloured sticks of good size. The Sutton Rhubarb received an award of merit from the Royal Horticultural Society a year or two ago, and in my opinion thoroughly deserved a higher award, as after two seasons trial it is better than older sorts, both for flavour and earliness, two important points. It also forces very readily. This variety is quite distinct from the more recently introduced winter Rhubarb, an American variety that requires no forcing, but merely protection.—G. W.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 80, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHERS. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—J. F. A.—1, *Dictamnus Fraxinella*; 2, *Anchusa sempervirens* probably, no flower remained; 3, *Ajuga pyramidalis*; 4, *Scilla lilii-lycynthina*; 5, *Phyteuma orbiculare*; 6, *Phyteuma orbiculare* variety; 7, *Eriogonum philadelphicum*.—Medway.—*Tragopogon pratensis*.—Rose.—1, *Phyteuma orbiculare*; 2, *Senecio Doronicum*; 3, *Centranthus ruber*.—Lady H.—*Phlox frutescens*.

Unhealthy Fuchsias (A. E. L.).—Judging by the shoots sent your Fuchsia has received some decided check, caused probably by the cold harsh weather that we have experienced this season. Now that the warmer weather has set in the plant will probably soon outgrow its ailment, and flower as well as ever, though, perhaps, a little later than usual.

Current shoots blighted (J. F. B.).—The Current shoots which you sent were very much dried up by the time they reached me, but as far as I can see the distortion of the shoots is due to the action of aphides. The best way of destroying the aphides is by spraying with paraffin emulsion, Abol, or some other insecticide containing paraffin and soft soap. This, however, will not improve the flavour of the fruit, which should be well syringed with water a few hours afterwards. When all the leaves have fallen collect and burn them, and when pruning the bushes collect and burn all that has been cut off. Towards the end of the winter and before the buds show any signs of opening spray the bushes with the following caustic wash: Dissolve 1 lb. of caustic soda in half a pail of water, then add 1 lb. of pearlash. Stir until all is dissolved, add water to make 10 gallons, and then add 10 oz. of soft soap which has been already melted in a little hot water. This mixture is very caustic, and must not be allowed to remain on the hands or clothes. Next season if the bushes be again infested spray with paraffin emulsion as soon as any injury is noticed.—G. S. S.

Pear tree diseased (I. H. WARD).—The branch of your Pear tree that you sent is infested with one of the scale insects (*Lecanium genesense*). If only a few shoots are infested I should cut them off at once and burn them, but if the insects are more or less spread over the tree I should spray the tree well with paraffin emulsion, avoiding the fruit as much as possible. If the tree be a small one you might simply paint the affected shoots over with the emulsion, having first rubbed off with a stiff brush as many of the scales as possible. It is as well when doing this to wet the brush with the emulsion or with soft soap and water. The insect lays its eggs beneath its scale, so that when these are brushed off there is a chance of the eggs falling on to other parts unless they are caught in some liquid. When the leaves are off go carefully over the tree and dress all the infested parts with paraffin emulsion.—G. S. S.

Ventilation of vineries, &c. (EDEN PHILLIPOTS). From your statement that the Azaleas placed under the Vines were known to be infested with thrip, it is impossible to come to any other conclusion than that the Azaleas are responsible for communicating the thrip to the Vines. This is a common occurrence, and arises from negligence on the part of the cultivator in not seeing that the plants are perfectly clean when placed in the vinery for protection during winter. These conditions assured there is no reason why such plants should not be wintered in a vinery. If, on the other hand, insect-infested plants are placed in the vinery all hope of successful Grape culture may be abandoned. Vines seriously attacked by thrip or red spider are so weakened and handicapped as to make it impossible for them to produce heavy crops of good quality fruit. The front ventilation of vineries is a question upon which conflicting opinions are held by experts. To answer your question satisfactorily one ought to know whether it has reference to early, mid-season or late Grapes. If it refers to early Grapes, ripening say at the end of May, the weight of opinion among experts is against the admission of front air

until the Grapes begin to colour. At that season the temperature may be properly controlled by the use of the top ventilators alone. The weather is then usually cold and changeable, and a draught of cold air coming in direct contact with the foliage may do much damage in a very short time by causing mildew or rust to attack the Vines. For later Grapes, during May and subsequent months, front air may be admitted, at first cautiously and sparingly, and only during bright and warm weather. As the summer advances more air may be given, but it is always necessary to exercise caution in the admission of front air. The cultivator's object in view should be to secure a warm, buoyant atmosphere without draughts which chill the air to the detriment of the Vines.

Fly (name of sender lost).—The brilliantly coloured little fly is one of the "Ruby flies" belonging to the genus *Chrysia*. In a garden it is of no importance one way or another, except from an æsthetic point of view, for they are most beautiful little insects. They belong to the same order of insects as the bees and wasps, and lay their eggs in the grubs of other insects belonging to the same order.—G. S. S.

Pæonies and Sweet Peas (E. H. J. CAISTER).—We cannot give the remotest reason for the failure of the former from the very small scrap sent. You give no particulars of cultivation, and you do not say if the disease so-called is of annual occurrence or only of the current year. In the latter instance Pæonies all over the country have suffered terribly from the frost; indeed, this crippled the plants so much that it was feared the buds were ruined. Such frosts as those experienced this year while the plants were in full bud have never before been known, the growths drooping for days. It is probable your plants have suffered from the same cause, and we could have given a more definite reply had you submitted quite fresh material. With regard to the Sweet Peas we say at once it is most unwise to plant in the same position year after year. Nothing is calculated to bring absolute failure more quickly than this. These and similar crops should be given a fresh position or fresh soil each year, the ground well prepared in autumn and liberally treated with nitrogenous manures. Farmyard or stable manure is excellent, and in fresh, deeply worked soil is capable of yielding the best results.

[JULY 18, 1903.]

HARDY FRUITS IN 1903.

A DISASTROUS YEAR.

THIS season will long be remembered in the annals of hardy fruit culture in the British Isles. From reports received early in the year we were prepared to hear of poor and partial crops throughout the country; but later reports gave a gloomy account of the outlook with regard to the returns that might be expected from our British orchards and gardens, especially of the most important crops of Apples, Plums, Cherries, and Pears. Year in and year out we are blessed with an abundant promise of bountiful crops by the rich and luxuriant display of blossom fruit trees always present in spring. This spring was no exception, as a better promise of abundant crops was never more apparent. Amongst other counties, we had the pleasure of visiting Worcestershire, where the trees in orchards and gardens were in bloom, and a more beautiful sight or a more promising prospect for a good fruit season we never remember.

The art of fruit growing in Britain has been brought to such perfection at the present day that the gardeners cannot be blamed in this respect, as the failure is due to the frosts. This year 8° to 10° prevailed for nearly a fortnight together whilst the trees were in full bloom. Under such unavoidable and deplorable conditions as these what becomes of the poor gardener's art and all his labour on behalf of his trees during the year? He has simply to confess himself hopelessly beaten. Is this to go on for ever? Must we always go on bemoaning our fate over this matter of the destruction of our fruit crops by the May frosts? Surely the genius and enterprise of British horticulturists will before long find out a way of solving the difficulty.

Attention was drawn in a recent article in *THE GARDEN*, with illustrations (see issue of the 4th inst.), to a system of covering large areas of land with temporary glass roofs and canvas sides for growing Roses and other flowers for market. These rough and cheap structures for the growth and protection of flowers have proved a complete success, not only in affording protection and improving the growth of the flowers, but financially also. The market grower cannot afford to indulge in fads and fancies. Hard cash is the standard by which everything he does is measured. Here, then, it seems to us that a successful

way has been pointed out by our market-growing friends how to save not only our bush fruit trees and Strawberries, but also our valuable early vegetable crops and salads as well.

These protectors are constructed of rough timber, and any handy labourer can put them together. They can be built of any size and height desired, and for the purpose of protecting fruit trees in bloom glass could be dispensed with and tiffany or herring nets would make an effective substitute. These erections once built will last for years, and when covered with portable lights of glass, as in the case illustrated, and heated with movable boilers and hot-water pipes as practised in the case referred to, they become not only protectors from frosts, but effective and profitable orchard houses, covering at a cheap rate any area of land desired. Adversity and failure are often as potent in teaching useful lessons in life as successes. Let us hope that the destruction of our hardy fruit crops of 1903 by frost will so impress upon gardeners and others interested the importance of protection that some such provision as we have indicated (or something better) will become general in gardens.

EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

BAMBOOS FLOWERING.

We have received the following very interesting letter upon the flowering of Bamboos from Captain R. C. Daubuz, Ryde, Isle of Wight: "To my great regret my specimen of *Arundinaria nobilis* is developing flower and seed. The specimen is 25 feet high and 8 feet through at the ground, and was planted some thirty years ago from seed taken from its predecessor on the same site, which flowered and died. This species flowered and died elsewhere the same year. I have enclosed a piece of the cane on which flower is not showing, the difference in size of foliage being remarkable. At the same time the shoots for this year, thirty or more, are 18 inches high and very vigorous. *Arundinaria Simoni* has also seeded

with me this year into a state of broomsticks. This has been noticed in *THE GARDEN* as occurring in several localities, and its liability to do this lessens its value. Two other specimens of *A. Simoni*, younger than the one alluded to above, have no seeds worth mentioning on them, so that age of plant and not season seems to be the factor of importance."

TUBEROUS BEGONIA.

Mr. Greenwood Pim sends from Easton Lodge, Monkstown, County Dublin, flowers of a superb crimson tuberous Begonia; the blooms are very large, not coarse, and finely fringed. Mr. Pim writes:—"I think this is a very handsome and not common Begonia—a fringed one—which I had from Dreer of Philadelphia a year or two ago. It is a very strong grower and free blooming, and produces flowers also considerably larger than those enclosed. I look upon it as a decided acquisition."

ODONTOGLOSSUM CRISPUM FLOWERS.

A correspondent, whose letter we have unfortunately mislaid, sends several spikes of spotted forms of *Odontoglossum crispum*. None of the varieties were of great value, that is, for their "spots," but all were very beautiful, and the spikes showed how well the plants have been grown. The varieties were very distinct, one almost pure white, except a spot upon the lip, and in one, a rosy purple shaded flower, we could trace the influence of probably *O. gloriosum*. We thank our correspondent heartily for so fine a gathering of flowers. *O. crispum* is one of the most easily grown of all Orchids, and should be one of the first selected by the beginner. We hope the sender of these flowers will write a short article upon the culture of this *Odontoglossum* as a help to those who would like to begin Orchid growing in a cool house.

FLOWERS FROM NEWRY.

Mr. T. Smith sends from Newry, Ireland, a charming assortment of good things. We note the more interesting.

Campanula persicifolia Newry Giant.—A very handsome half-double form of one of the best of all Campanulas. The flowers are very large, pure white, and thickly set upon the stem. A group of this in the garden would make a brave show of white, and be less likely to suffer in rough weather than if composed of the single variety.

Veronica hybrida Newryensis.—A very free and pretty form with dense spikes of white and blue flowers. It has a fine leaf and is exceptionally free in all ways.

Anthericum plumosum.—A pretty grassy Anthericum with white flowers.

Iris Delavayi.—Very dark purple-blue with white base to the segments. A handsome and graceful flower.

Campanula persicifolia Daisy Hill.—This is a companion to the Newry Giant mentioned above. The flowers are very large, with two rows of thick blue petals. It is without the grace of so beautiful a flower as the single white *alba grandiflora*, but is a good border plant.

Helianthemum vulgare Lemon Queen.—A quite double yellow variety. A plant for sunny banks.

Iris ochroleuca.—A noble Iris, and the flowers sent are a pleasant reminder of their beauty of colouring.

Ozothamnus rosmarinifolius.—One of the prettiest and most fragrant of shrubs. It is one of the few shrubs that flower in summer, and at this time the dense white clusters are welcome.

Anchusa capensis.—A distinct biennial from South Africa, with flowers of deepest blue, much like those of the better known *A. italica*.

Rosa moschata.—The Musk Rose, sweet and free, but without the charm of the larger variety *nivea*.

Delphinium grandiflorum.—Mr. Smith sends the intense purple type, finely grown, and a clear blue variety named *pallida*, the colour of *D. Belladonna*.

Rosa rugosa x *polyantha*.—A distinct cross between the two species, and with the parentage about equally shown. It should be a good half climbing Rose, but Mr. Smith tells us nothing about its habit.

Old garden Roses.—We were pleased to find in the collection bunches of the deliciously sweet old garden Rose Spong and the De Meaux in three forms, one pure white, and all very fragrant.

Asphodeline isthucarpa.—A soft salmon-brown striped flower, opening about 11 a.m., not showy, but interesting.

Among other things were the soft white flowers of *Cytisus schipkense*, a pretty garden shrub, rare, but should not remain so; its flowers appear in profusion.

EPIPACTIS AMERICANA.

Mr. Field, Ashwellthorpe, Norwich, sends spikes of the very interesting *Epipactis americana*. This plant is as hardy as the common Rhubarb, if only planted in congenial soil and position; it does well in a free sandy soil mulched with leaf-mould or cocoa-fibre, and in a partially shaded spot. It will be found to succeed with pretty full exposure, or in fact as a border plant. It makes a good companion to our hardy *Cypripediums*.

A tall Orchid with quaintly coloured flowers, brown, touched with purplish rose.

STRAWBERRY GIVON'S LATE PROLIFIC.

Mr. George Bunyard, The Royal Nurseries, Maidstone, sends a box of this valuable late Strawberry. The fruits are very large, of a rich red colour, and really good flavour. Mr. Bunyard writes: "This is proving one, if not the best, of our late large Strawberries. The plants are sturdy, of vigorous growth, and the fruits are produced over a long period."

LILIUMS FROM COLCHESTER.

Messrs. R. Wallace and Co., Kilnfield Gardens, Colchester, send a choice collection of Liliiums, Calochorti, and other seasonable flowers. The Lilies are a lovely lot, and include flowers of the choicest species and varieties, many of them of very beautiful colouring. They are as follow: *Lilium elegans* Orange Queen, rich apricot-buff; *L. e. atro-sanguineum*, blood red; *L. Martagon* dalmaticum, deep ruby-red (one of the best forms); *L. M. Catani*, with large black-red flowers; *Lilium venustum* macranthum, beautiful rich apricot colour; *L. excelsum*; *L. concolor* var. *Coridion*, a pretty, small, bright yellow flower; *L. colchicum*, deep primrose ground with bands of deeper yellow and purple dots; *L. superbum*, a spreading star-like flower heavily spotted with purple-black upon an orange-red ground; *L. Humboldtii* magnificum, one of the most gorgeous of Lilies, the ground colour of the recurring petals is orange, the lower half blotched with vinous red, the upper part spotted with purple-brown; *L. Brownii*, pale purple-brown outside and white within; *L. longiflorum* albo-marginata, with white margined pale green leaves; *L. Marhan* (Martagon x Hansonii). The Irises include *I. aurea*, rich yellow; *I. Monnieri*, large, lovely deep lemon-yellow; *I. intermedia* (aurea x gigantea), and aurea x Monnieri. There are also Calochortus venustus pictus, *C. v. citrinus*, *C. v. oculatus*, and the large yellow *C. clavatus* with a beautiful fringe on the petals. *Eremurus* Bungei, a most attractive plant

Eremurus x *Olga*, a soft, rather dull yellow; *Brodiaea californica*, lilac-purple; *B. peduncularis*, *B. ixioides*, *B. Purdyi*, rich purple, and *Ornithogalum pyramidale* also were represented.

SEEDLING MECONOPSIS.

"I send you a few more blooms of the seedling *Meconopsis* plants which have been very brilliant this season. I also add for your table blooms of *Clematis Pallasii* purpurascens, *Carpenteria californica*, *Escallonia langleyensis*, *Veronica elegans* var. *carnea*, and *Typha minima*.—JOHN MCWALTERS, *The Mall, Armagh*."

The double seedling Poppies are very bright, orange-red and yellow, while the large pure white Anemone-like blooms of the *Carpenteria* are very beautiful; *Veronica elegans* carnea has erect racemes of pretty purple-pink flowers, and the *Clematis* bears numerous small white blooms.

LILIUM ELEGANS PETER BARR.

Messrs. Barr and Sons, King Street, Covent Garden, write: "We send you herewith a sample bloom of quite a new variety of *Lilium elegans* called Peter Barr. It is now flowering freely at our nurseries, and grows 1 foot high. It is quite as hardy and robust as any of the other varieties of *Lilium elegans*."

The flower of this new Lily is large and handsome. The colour is perhaps best described as rich apricot-buff, the colour being most intense in the centre of the petals. These are slightly spotted with reddish brown. A flowering plant would undoubtedly be a striking object.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

July 21.—Meeting of the Royal Horticultural Society's Committees and National Carnation and Picotee Society's Show, both at Drill Hall, Westminster, lecture by Mr. G. Hunt on "Horticulture in, and the Flora of, New Zealand; Tibshelf Rose Show.

July 22.—Newcastle (three days), Cardiff (two days), and Glasgow and West of Scotland Pansy Shows.

July 23.—St. Ives and Selby Flower Shows.

July 29.—Chesterfield Horticultural Show.

August 3.—Basingstoke, Newbury, Sheffield, Grantham, Lichfield, and Headington Horticultural Shows.

Royal Horticultural Society.—The next meeting of the above society will be held at the Drill Hall, Buckingham Gate, Westminster, on Tuesday next, the 21st inst., from 1 to 6 p.m. In connexion with this meeting the National Carnation and Picotee Society will hold its annual show. Instead of the subject previously announced, the lecture will be on "Horticulture in, and the Flora of, New Zealand," by Mr. G. Hunt.

Rose Frau Karl Druschki.—The twelve blooms of this beautiful Rose from Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester, were a conspicuous feature in the show of the Richmond Horticultural Society on July 1, and deservedly won the first prize. In our report this prize is stated to have been gained by another exhibitor, which is a mistake.

Lecture on Hardy Irises.—A most interesting lecture was given upon Irises at the last meeting of the Royal Horticultural Society by Miss Armitage, and Mr. Caparne was also to have lectured upon the same subject, but his notes will appear in the society's journal. We hope to reprint the lectures when they are published.

Glasgow Rose Show.—Just as we were going to press we received a wire from our correspondent at the Glasgow Rose Show, giving the prize winners in the leading classes. Messrs. Harkness and Co., Hitchin, were first in the class for thirty-six blooms (distinct), and Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester, were second. Messrs. Alexander Dickson and

Sons, Newtownards, were first for forty-six blooms; and Messrs. Harkness and Co. were again first for thirty-six blooms (trebles). A first prize for thirty-six blooms (distinct) was won by Messrs. Townsend and Sons, Worcester. Mr. Geo. Prince, Longworth, Berks, was the chief prize winner in the classes for Teas and Noisettes. Competition was strong in the leading classes, and a splendid show resulted. We shall give a report next week.

Bamboos flowering.—The following which appears in *Indian Planting and Gardening* will doubtless be read with interest: "With reference to the flowering of the Bamboos, their alleged death in consequence of the production of seed, we append an extract from an official report drawn up by Major-General C. Lucie-Smith, when Deputy Commissioner of the Chanda district, in the Central Provinces of India, a tract of country some 10,000 square miles extent, over more than half of which in 1869 the forest rolled league upon league, one mighty mass of trees and Bamboos. General Lucie-Smith was for some years in the West Indies and South America, but he never heard that the Bamboos growing in those countries died after flowering. 'The uses of the Bamboo,' he wrote, 'are also infinite, and it could probably be the least use by the people of all the products of the forest. It is of two kinds—the common and the Kutung Bamboo. The first grows in all light soils, and each clump there will be one or two canes which shoot up above the others, with only a small hollow at the core, being the male Bamboo, so prized in the shafts of hog-spears. The Kutung is much larger than the common species, attaining a height of 60 feet, with a corresponding thickness of stem, and grows chiefly on the banks of streams. In the Khalsa country it is found principally in the dense Mohurlee forest, but the Zemindars have it in great abundance. During the rainy season young cane shoots from the ground, and being tender, though of considerable thickness, are easily eaten by the Gouds. It seeds at irregular intervals, and the produce is carefully collected for food. With the effort the Kutung dies, and people of all classes believe that seedling only take place during years of scarcity. My own experience is, that in each year since 1864, various clumps of Kutung have seeded in succession."

Spiraea arisefolia.—Introduced in 1861 from North-West America, this flowering shrub has become very popular in this country, and the shrubbery there are few more beautiful sights at the present time. Though the colour of the flowers is sometimes described as a dirty white, the term creamy white would seem more applicable, and these are produced in large panicles so long as almost to hide the foliage. This *Spiraea* is a spreading bush 8 feet to 10 feet in height, requires little attention, but the current season's growth must be pruned away. Considering the ease with which it can be cultivated, and the happy in almost any soil or situation, it is assuredly a shrub worth including in all gardens, large or small.—A. E. THATCHER.

Swanley Horticultural College. To-day (Saturday) the Lady Frances Balfour presents the prizes to students at the above college who have been successful during the past year. The Hon. Sir John Cookburn, K.C.M.G., will take the chair at four o'clock. Trains leave Victoria at 12.50 and 2.42 for Swanley Junction. Visitors are especially requested to arrive by the early train, as to have time to inspect the college, South Bank Colonial Branch (West Bank), and grounds. The college is 1½ miles from the Swanley Junction Station on the South-Eastern and Chatham Railway. Carriages will meet the trains. Return trains leave Swanley at 4.43 and 6, arriving at Victoria at 5.36 and 6.37 respectively.

Pavetta caffra.—Introduced from South Africa about eighty years ago, this flowering shrub (which succeeds best in a warm greenhouse) is rarely seen, though it is decidedly ornamental. It forms a neat-growing, freely-branched shrub clothed with smooth obovate leaves, while the terminal clusters of flowers, which are borne in compact rounded heads, are white, with

prominent stamens. It flowers at this season, and is not at all difficult to cultivate if potted in a mixture of loam, peat, and sand, the peat predominating. Being a native of Caffraria, it needs a little more heat than plants from the southern portion of Cape Colony. It will flower well when little more than a foot high, but is said to reach three times that height. Under the name of *Pavetta borbonica*, a very ornamental, fine-foliaged stove plant has been long grown in gardens, but it is very questionable if it is a *Pavetta*. It has, however, I believe, not yet flowered in this country, and until it does so this name must suffice. In general aspect it somewhat resembles an *Aralia*, the long narrow leaves being dark green studded with white spots, while the midrib is of a bright salmon hue. This *Pavetta* requires a stove for its successful culture.—T.

Achimenes tubiflora.—This is widely removed from the generally cultivated varieties of *Achimenes*, as, in the first place, it forms a firm tuber-like root instead of the small scaly ones of the other sorts; it also pushes up a stem 18 inches to 2 feet high, the upper portion of which bears several large white flowers. Individually these are long-tubed, with the expanded mouth about 1½ inches across, and of the purest white. Eight or ten flowering spikes form a most attractive group, especially when associated with some low-growing subjects that are overtopped by the flower-bearing portion of the *Achimenes*. It is a native of Buenos Ayres, and has been long known in gardens, but is cultivated only to a small extent. The name of *Gesnera tubiflora* is sometimes given to it.

Ixora coccinea lutea.—In the days when specimen *Ixoras* used to figure largely at the different summer exhibitions this form (now flowering in the stove portion of the T range at Kew) would have been eagerly sought after, owing to the distinct colour of the blossoms. It is a variety of the old and well-known *Ixora coccinea*, but differs from the type in the flowers being of a very pleasing shade of soft yellow, without even a suspicion of the salmon tint which occurs in so many *Ixoras*. One scarcely longs for the large formal specimens of bygone days, but at the same time neat little bushes of *Ixoras* in pots 6 inches to 8 inches in diameter form, when studded with their clusters of bright-coloured blossoms, an attractive feature in the stove.—H. P.

Flowers that attract butterflies. An enquiry is made on page 434 for the names of plants which are noted for attracting butterflies (not white ones) in late summer. I do not know of anything as certain as *Sedum spectabile*, when in bloom, to have a number on or about it on a fine day. Red Admirals, also Peacocks and Tortoiseshells—but Red Admirals in particular—seem to be specially fond of the heads of flowers, on which they rest with their wings opened flat, seemingly in complete enjoyment of sunshine and nectar. The plant is easily grown, and effective both in and out of bloom, compact of habit, and unless drawn up into weak growth in a shady place, never untidy, so that apart from its speciality as a butterfly collector it deserves to be seen more often than it is.—C. SCRABE DICKINS.

Hollyhocks and the disease.—Last year I wrote a short letter on Hollyhocks and the Hollyhock disease, setting forth my own theory that the latter was, to a certain extent, caused by over manuring. My subsequent experience may be of interest to your readers. The plants here having been pronounced by a good authority (Mr. Woodall) to be infected with the disease, I told the gardener to burn them all. This he did, but forgot some on a side border which were not apparently infected. We then proceeded to sow some fresh seed from Sutton. This, in due course, germinated. When the leaves of the seedlings developed they, too, appeared covered with the disease. Could it have been left in the air? These again I told the gardener to burn. He asked to be allowed to keep them till this spring, and in the meantime burned all the old ones from the side border. He then syringed the seedlings with the usually prescribed remedies and pulled off all the diseased leaves, with the result that

by Easter they were more diseased than ever. I then ceased to take any further interest in the matter, and the gardener planted out the diseased plants in a corner of the shrubbery which we had recently reclaimed from nettles, and which, turning out to have been an old ash tennis court, consisted entirely of ashes and sand. Judge of my astonishment a few days ago at finding the plants growing vigorously and appearing perfectly free from disease. The Hollyhocks in the village here look more vigorous than ever this year. I recently saw a row growing 6 feet high in a neglected and dry border not 18 inches wide on the north-east side of a cottage, and another lot over 7 feet high in a similar position in a back yard. Any further experiences shall be chronicled.—BASIL LEVETT, Wychnor, Staffs.

Border Carnation Countess of Paris.—I have grown this variety for the last fifteen years, and it holds its own as one of the best for earliness, delicate shade of colour, and total freedom from splitting of the calyx. It is not so large as some of the newer varieties, but in good soil will come slightly above medium size, and all the blooms develop well. At the time of writing (July 8) we have half a dozen good flowers on many of the plants. It is a variety that requires a little extra attention to secure well-rooted plants for the October planting, from the fact that the grass is somewhat thin and wiry, and root development is slow. Early layering is absolutely necessary, and the soil about the layers should be kept always on the moist side. *Cassandra* is very similar to the foregoing in shape and colour, but is late flowering.—E. BURRELL.

Superintendent of Battersea Park.—We have received the following letter from Mr. J. Rogers, superintendent of Battersea Park:—"My attention has been drawn to a report which appeared in your issue of the 20th ult. of a lecture given to the members of the Battersea, Clapham, and Wandsworth Chrysanthemum and Horticultural Society by Mr. D. Crane, of Highgate, upon 'Violas.' The chair (it is stated) 'was taken by Mr. Weatherston, the able superintendent of Battersea Park,' which statement is very misleading, as this position is held by me, and not by Mr. Weatherston. I shall, therefore, be glad if you will kindly give publicity to this error." [We publish Mr. Rogers' letter with pleasure, and much regret the mistake we inadvertently made. The note in question was sent to us by a correspondent in the neighbourhood.—ED.]

Cardiff Gardeners' Association.—Mr. John Julian, honorary secretary, writes that the annual outing of the above association will be to The Hendre, Monmouth (the seat of the Right Hon. Lord Llangatock), on Monday, August 10. The train will leave the Great Western Railway Station, Cardiff, at 9.20 a.m., returning from Abergavenny at 8.45 p.m. The tickets (to members) will be 10s. 6d., which will include railway journey, dinner, and brake fare to The Hendre and back. Members who would like to take a friend (ladies excepted) may do so, providing the limit (which will be strictly adhered to on this occasion) is not exceeded by the members themselves. An early application should be made for visitors' tickets, which will be issued on the same conditions as for members, excepting that the price will be 2s. 6d. extra. The drive from Abergavenny to The Hendre and back, if practicable, will be a circuitous one of about 28 miles. Members are particularly requested to pay strict attention to the times on programmes, which will be supplied with tickets, and Mr. Julian asks that all who wish to go should let him know not later than August 1.

Society for horticultural science. A movement is on foot to establish in the United States a society for horticultural science. Professor Beach, of the New York Experiment Station, Geneva, New York, is an active promoter of the society, and those interested should address him for particulars. The object of the society is more fully to establish horticulture on a scientific basis. The membership would naturally be made up of the horticulturists of the experiment stations and of the United States Department of Agricul-

ture, together with other scientists whose work has a horticultural bearing. The meetings would be held in connexion with those of some kindred society, as the American Pomological Society or the American Association for the Advancement of Science. This society would not supplant any existing horticultural activities, but would supplement all of them. It would aim to do for horticulture in general what the Plant Breeding Conference did for one special branch—it would call forth and centralise the most advanced horticultural thought of the day. It would be a Plant Breeding Conference generalised. If a sufficient number of favourable replies are received it is proposed to hold the first meeting in connexion with the meeting of the American Pomological Society in Boston, September 10 to 12 next.—*The Florist's Exchange, New York.*

Cydonia Sargentii.—As one who has grown this little *Cydonia* for the last three years I may be permitted to express agreement with what is said by Mr. Goodwin about it. I am satisfied that my plant, also received from Mr. Smith, of Newry, is the same as Messrs. Lemoine's *C. Sargentii*. It is a charming plant for the rock garden, and this season it was greatly admired here when in bloom, at the same time as the double white *Arabis*, which partly carpeted it. The picture presented by the fine white flowers of the *Arabis* and the clustered orange-scarlet flowers of the *Cydonia* was a pleasing one. It bore only one fruit last year, but it was large for the plant. The fruit remained hard and green until late in the season, and its appearance was not tempting enough to lead one to test if it was edible. This season some of the later blooms appear as if they had set for fruit, but the earlier ones did not do so. We have none too many shrubs of its character suitable for the rock garden, and those who secure it will have reason to thank Mr. Goodwin for drawing their attention to it.—S. A.

Tropaeolum polyphyllum.—This distinct trailing *Tropaeolum* is not so much seen in gardens as its merits deserve, and its capabilities for growing on rough rockwork or for covering banks in the early summer are not well enough known. It is very largely grown in the lovely garden of the Messrs. Walpole at Mount Usher, County Wicklow, where many will recollect seeing it in perfect health on the upper parts of the banks of the old mill-stream. It is not always so happy, however, and I have found that this is largely owing to its being given a position in a place where it becomes too dry at or near the flowering time. In these circumstances it soon becomes yellow in the foliage, and goes to rest without flowering. In the garden of Mr. P. Neill-Fraser, at Rockville, Edinburgh, it does well on the rockeries near the entrance to the house, but the best-flowered plants I have ever seen were in bloom in the garden of Mr. W. D. Robinson-Douglas of Orchardton, Castle Douglas, N.B., the other day. They were on a rockery where the roots were in moist peat and under the shade of small shrubs and other vegetation. Through this the trailing stems pushed to the sun, and the plants were remarkably free flowering, and made quite a brilliant effect with their yellow blooms. I have seen it do well in many other places, among these being at Straffan, but nowhere have I seen it so fine as at Orchardton. In my own garden it has done but poorly, but the result of my past observation has convinced me that my plants of *T. polyphyllum* must be removed to a moister position to secure the most satisfactory results.—S. ARNOTT, *Carsethorn by Dumfries, N.B.*

Pelargonium Paul Cramfel.—This is probably one of the finest introductions of late years, either for bedding or pot work, of dwarf compact habit, very free colour, a rich glowing scarlet, with very large trusses, which stands remarkably well. I am using it both in and outdoors this summer, and am so well satisfied with it that all cuttings available will be obtained for another season. It has not yet been tried for winter flowering, but a good batch is coming along in the pits for this purpose. I think the combined habit, colour, and freedom should render it an ideal variety.—E. BURRELL.

Scarcity of fruit in West Middlesex.—The outlook for growers who rely upon their fruit crops for a living is so dismal that in conversation with those who have had fruit farms for over half a century, I am told that such an entire failure has never been known. I recently went over several acres of Plums, and I do not think I saw a hundred fruits, the owner remarking that there was not a bushel in the whole place, and this is not an isolated instance. In many cases the trees are young, well nourished, and fairly clean. The only varieties I saw with a few fruits here and there were Gisborne and Orleans. Pears are even worse than Plums. I counted in my garden three fruits on one hundred trees, and this is general in this part of the country. The trees are also badly attacked by insect and other pests. Mealy bug is rampant, in spite of heavy rains and severe frosts, and this will affect next season's growth. Apples are a peculiar crop. In some cases there is a medium crop of Cox's Orange Pippin, and this is doubtless owing to their late flowering, and small trees are cropping much better than large ones. This was probably because they are more sheltered. The same remarks apply to Lane's Prince Albert, which is always reliable; it did not fail in the worst season I ever remember. Large fruit growers say that they have very few small fruits. The Raspberry canes were much injured, and Currants and Gooseberries dropped wholesale, while Strawberries in most cases are only half a crop. Of Cherries there are practically none. There are a few cases where a tree has a crop, but these are peculiar, as often only a road divides quite barren trees and those that have fruit; the variety is the same, and often the trees are of the same age and size. In my own case we have a few Keswick Codlin Apples on a quarter that is sheltered from the east, but none in any other position. Most of the trees that have any fruits at all naturally flower late. I hear that much the same condition of things exists in many parts of the country. In private gardens the late Pears are always a valuable crop, as they are so useful for dessert when there is a more restricted choice of fruits, and what with other losses the grower's lot this year is not a happy one.—W. M.

THE TULIPAS.

(Continued from page 24)

TULIPA MACROSPEILA (Baker).—An old and valued garden plant with flowers of sweet fragrance. It grows 18 inches high, and is mainly of gesneriana shape and habit, the petals light reddish scarlet, darker externally, forming a deep cup-shaped flower when expanded. The inner basal colouring is black, five sided, and edged with old gold as a dividing colour. Though an old plant it is one of the best late-flowering Tulips, remarkably hardy and vigorous, and growing well in even the poorest soil. One can leave it for years undisturbed, and though it will not increase after the fourth or fifth year on the same site, it will not deteriorate. I have never seen this plant suffer from any disease. Its flowers last long in good condition, and their bright colour, pleasing shape, and sweet fragrance should recommend them to the planter. Several colour forms are grown, but they are not distinct "breaks," merely shade variations, which may or may not be consistent under varying conditions of soil and climate.

T. maculata (Baker) is a taller growing plant, generally 2 feet high, with rather weak stems and medium sized rich crimson flowers. They are like those of *T. gesneriana* in shape, and their bases are dull black, very regular in outline, edged golden yellow. The petals are stout, and stand wet weather well. Many garden forms are known and grown.

Var. brilliant is shorter, exactly resembling the fragrant *macrospila* in outline, colour a bright shade of scarlet-crimson, darker externally, base black, edged yellow.

Var. globosa has very full petalled flowers of perfectly globular outline when closed, coloured a rich lustrous shade of crimson, base intense glowing black. There are two forms *grandiflora* and *nana*.

Var. The Moor is a tall plant with stout stems and glowing scarlet flowers, which expand widely, and their basal colouring is blue-black. This plant and *var. major* are the two best forms of *T. maculata*. They all flower late in the season, lasting till the third week in May. The Moor is the last Tulip to flower save *T. Sprengeri*. They are all accommodating plants, requiring but little care in their cultivation.

T. Marjoletti is a pretty Tulip of billictiana form, the origin of which is unknown to me.

It has slender stems, egg-shaped buds with pointed petals, which do not expand widely, colour a creamy yellow, flushed vermilion near the base on both surfaces; they average 3 inches in length, the inner petals being much broader than the outer, and the basal colouring is a well-defined ring of brown and green. It is a pretty Tulip, of elegant form and delicate colouring, excellent as a cut flower. Its soft colouring is very beautiful under artificial light. Treatment of billettiana, late flowering.

T. mauriana (Jord.)—A fine late-flowering species from Savoy, of gesneriana shape and habit. It should become popular when better known. It grows 18 inches high, has crimson scarlet flowers which are 8 inches in diameter, the basal colouring is a perfect ring of yellow, and the anthers are black. The petals are ovate, nearly equal in size, of stout substance, and their surfaces are very lustrous. The habit of the plant leaves nothing to be desired, and one can recommend it as a capital garden Tulip, distinct in character and colouring, quite weatherproof. At the Temple show, 1902 someone who thought its name had been misspelt altered the label to *T. mooriana*, as the species will be found recorded among plants that there received an award of merit under the name of *T. mooriana*.

T. Maximowiczii (Regel) is a species from Bokhara, coloured purplish red with scarlet shading, basal blotch dark. It is very rare in size and habit to *T. linifolia* and *T. wilsoniana*, and may be similarly grown.

T. maleolens is a European species of no garden value.

T. micheliana, a new species from Eastern Europe, has stout stems above a foot high, leaves lined and flecked as in *T. Greigi*, but sometimes simply glaucous, flowers the petals very broad at the base, coloured reddish scarlet with a well-defined brown or black basal blotch, which runs halfway up the petal. The flowers lack refinement, but with a little trouble seedlings could be reared from the few unflowered forms that are found among imported plants collected wild, and thus establish a better garden type. The leafage and stout stems are those of *T. Greigi*, but the flowers are little better in character than large *T. montana*, the "undesirable" among Tulips. *T. micheliana* flowers in April, cultivation as for *T. Greigi*.

T. montana (Lind.) is a variable plant found on mountain ranges in South-Eastern Europe; its chief home is Persia. It is a dwarf plant with pale scarlet lanceolate petals almost entirely yellow externally, the outer ones being considerably longer than the inner ones. The basal colouring is a mixture of yellow and black, invariably well defined, and generally reaching halfway up the petal. Its garden value is slight, and it is described here because amateur collectors hobby making in its country often bring it home with them as a souvenir in April; grows anywhere.

T. nitida.—A small flowering Bokhara species, newly introduced, resembles *T. Korolkowii* very closely. It has very slender leaves, dark

CYLLIPEDIUM SPECTABILE (THE MOCCASSIN FLOWER OF NORTH AMERICA). (Reduced.)

carlet-vermilion flowers with black basal colouring. It was introduced in 1902, and one year's cultivation is insufficient to determine its value as a garden plant, especially as but 5 per cent. of its bulbs as collected have flowered.

G. B. MALLETT.

(To be continued.)

TREES AND SHRUBS.

CYTISUS SCOPARIUS VAR. ANDREANUS FAILING.

I HAVE read the recent notes about the failure of this plant in two very different kinds of soil with regret, and everyone will agree that it is a great pity such a handsome flowering shrub as this should not thrive.

The fault, however, lies mainly in the method of propagation, which is performed either by means of cuttings, grafts, or seeds for this plant, for the various other hardy forms of *Cytisus* and *enista*. When raised from cuttings *C. s. var. andreas* and *C. purgans* have the habit of suddenly going off sooner or later, usually within the first four years of their existence. All the other hardy *Cytisuses*, as far as I know, make good plants without any signs of weakness when raised from cuttings, notably *C. praecox* (*C. albus* *C. purgans*), which, from its hybrid origin, one could think would be the first to fail. The exact cause of the failure of plants raised from cuttings, the two mentioned above I am unable to say, but if they are examined the roots will be found and springing from around the foot of the cutting, the callus not extending under the base, leaving the central pithy part entirely unprotected. Obviously this is the cause of failure, as I have seen and plants with the stem entirely rotted, while the roots are sound. The moisture seems to strike upwards through the plant, rotting the stem, and using it to go off sooner or later.

By grafting *C. s. var. andreas* on stocks of *C. scoparius* plants are obtained which usually do well, though they are sometimes attacked by a fungus, which is, I believe, principally caused by ringing the scions from an unhealthy plant rather than being characteristic of it when grafted, as, on the whole, it does fairly well when worked. Propagation by seeds is a rather trying task with this plant, as being a sport—though a natural one—does not come true from seed, though if the latter were taken up in a proper manner I do not think why one could not raise it true from seed. As cuttings are now seedlings are very variable, a large percentage being of the true *C. scoparius*, while of the remainder probably not 5 per cent. will be true *andreas*, but vary between the two, being, as a rule, dirty brown markings and very few flowers.

Bagshot, Surrey.

J. CLARK.

THE FLOWER GARDEN.

MULCHING TUFTED PANSIES.

OFTEN regarded as unsuitable to hot and dry gardens are Tufted Pansies, but this is not so. I have in my mind at the moment a garden in which the Tufted Pansies are grown quite freely, and this same garden is in a position where the plants are exposed to the sun from early morn until evening. The garden is also on a hillside, and any plant that may fall is of comparatively small benefit, owing to the character of the soil as well as the apparently unsatisfactory position of the beds and borders devoted to the plants. The gardener, fortunately, is an enthusiast, and has overcome the difficulties of situation, &c. He is a true believer in deep cultivation, and not only does he deeply till the soil, but manures it very freely

also. His plants in consequence have a free root run, and the soil is also kept moist. He pins his faith, however, very largely to a thorough system of mulching the beds and borders. The mulching material is applied quite early in the summer, as a matter of fact before the really hot weather arrives. A small quantity of loam is added to a large amount of horse manure, and the latter is prepared as for a Mushroom bed, and before doing so is carefully broken up and repeatedly turned over. In this way excellent mulching material is made, and this is worked well into the collar of each plant. The surface of the beds and borders is also dressed with the same preparation. By these means the roots are kept cool and moist and the plants thrive luxuriantly. The mulch is not in the least unsightly, and after a few days assumes the normal appearance of the garden soil. Long before the flowering season is over the beds are covered with growth.

D. B. C.

HARDY LADY'S SLIPPERS.

Few hardy plants are more admired than the hardy Lady's Slippers, as *Cypripediums* are often called. The popularity of the plants is well deserved, and as it becomes realised each year that these Orchids are absolutely hardy in British gardens the demand will increase. During the past few weeks a representative exhibition has been seen at the Drill Hall, while the method of staging the plants in colonies or groups not only impresses the visitor with their worth, but at the same time indicates something of the way in which the plants may be arranged in the open garden. It is, indeed, in the garden where such plants show their fullest beauty, and none more so than when a few years established in one spot. In the matter of cultivation there are few, if any, difficulties to surmount generally, while those we illustrate to-day may be safely regarded as the least exacting of the whole race. Taking first the lovely Moccasin flower of North America,

Cypripedium spectabile, we have, perhaps, the finest of the group. The flower is rich and varied in colour, some nearly pure white throughout, others with very rich or intensely coloured labellum, and others again quite intermediate between these extremes. It is of fine stature, often more than 2 feet high, and when established the strongest crowns each year give two and occasionally three flowers in a scape. This species is practically a bog plant, revelling in peat and leaf-soil, while decaying manure may also be added each year. The finest beds of these ever in my keeping were given a covering of leaf-soil and manure each winter, and no plants could have yielded a greater return. Then with moisture at hand all the summer the masses of roots horizontally produced extended quite 2 feet from the tufts. Shade is quite as important. Pot plants may be put out at any time, but the best period for planting freshly imported examples is during autumn and winter. The natural flowering period of this fine hardy plant is July. No other species is so strictly bog-loving as this.

C. pubescens.—This may be accepted as the

CYPRIPEDIUM ACAULE. (Reduced.)

finest of yellow-flowered species, the glistening yellow pouch and twisted narrow petals, the colour of which is brown, giving the flower a distinct character. While not objecting to peat in some degree the plant develops best in moist loam and leaf-mould. The stems are 1½ feet high when well grown, the plant flowering in April and May. North America. Another yellow-flowered species is

C. calceolus, a rare British species, probably now extinct as a wild plant. This may be grown beside the last named, while it is a noteworthy fact for those who live in calcareous districts that this plant is very happy when upon such formation. While some other species may resent the application of lime or chalk, the English Lady's Slipper may be naturalised in this soil. The flower is smaller than *C. pubescens*, the smaller leaves are more erect. It is a most interesting plant.

C. acaule.—Some of the finest examples I have seen of this species have appeared this season at the Drill Hall, the foliage being even more satisfactory in its fine proportions than the pleasing and large rosy purple flowers. It may be well grown in sandy loam, and perhaps it may be said that very few so thoroughly appreciate sand at the root or base. This may be given freely. Light shade is also desirable. This species is not difficult to grow. The rare Siberian

C. macranthum is one of the finest of all the

CYPRIPEDIUM PUBESCENS. (Reduced.)

washy and poor things we now get from Japan under this title, they are a libel upon one of the best of hardy Orchids. E. J.

EVERLASTING PEAS.

ONE is glad to see Mr. R. Dean's note on the early-flowering Everlasting Peas, and his reference to the reputed non-seeding of *Lathyrus grandiflorus* induces one to follow him with a few notes on the whole subject. That *L. grandiflorus* does occasionally produce seed in this country I have had proof of, as I saw last year a pod, containing apparently fertile seeds, on a group of *Lathyrus grandiflorus* in a neighbouring garden. I have also raised seedlings from seeds purchased as those of *L. grandiflorus* var. *Frederici*, but the flowers the seedlings give differ little from those of the common *L. grandiflorus*, though, perhaps, a little larger and slightly deeper in colour. Of course, these seeds may have been raised abroad. Seeds of the typical *L. grandiflorus* are offered by seedsmen. There appears to be room for some variety in this Everlasting Pea, whose flowers are certainly by far the finest of the perennial Peas, and we must forgive its spreading tendencies for the sake of its beauty. Has any one here flowered *L. grandiflorus floribundus*, of which I have only a small plant? I am pleased to see that Mr. Dean speaks so highly of *L. Drummondii*, considered by the authors of the "Index Kewensis" to be distinct from *L. rotundifolius*, although often reckoned as synonymous in gardens. One is dis-

resting to me, especially as the coloured plate in THE GARDEN of this lovely species was from flowers I sent to the Editor. Those who grow it will do well to keep a reserve plant or two under glass in winter, as it may be lost outside during an exceptionally hard winter, or from a combination of bad weather conditions such as we have had this season. Wood's Scarlet Pea, which I take to be the true *Drummondii*, has been killed also, but *L. rotundifolius* has escaped. May I ask if any of your readers have tried propagating *L. latifolius* from cuttings of the old growths just as they push in spring when grown under glass? I have a plant of a very fine white variety which was given to me by a good plantsman who was in the habit of propagating it in this way. It is true that this species may, as a rule, be propagated by cuttings of the young growths from the base in spring, but these are not always procurable from some individual specimens, and the alternative method is worth considering.

Carsethorn, by Dumfries, N.B. S. ARNOTT.

CHERRY GROWING.

(Continued from page 26.)

CHERRIES IN POTS.

To those who are in possession of the necessary glass accommodation the pot culture of Cherries commends itself as a means by which the finest of fruits may be obtained both early and in succession.

posed to agree with Mr. Dean in thinking them distinct. I may also be permitted to mention the manner in which *L. latifolius* of gardens, called by Mr. Nicholson *L. sylvestris* var. *platyphylus*, has suffered this season from the unseasonable weather. I find that Mr. James Allen, at Shepton Mallet, has had an almost similar experience this year, but, if possible, an even worse one. The plants here made growth early in the year, but this was cut down by the late frosts, and some have never pushed shoots since. Those which remain are quite weakly, with the exception of one, which scrambles through a hedge, and was protected partly by its growths being shielded by the branches. I have to deplore the loss of a very fine white variety, which has totally disappeared, though in a warm position.

Another Everlasting Pea of somewhat similar habit, with dull-coloured flowers, which I received as *L. armitageanus*, has suffered like *L. latifolius*, but is now making fresh growths again. *L. tuberosus* is such a favourite with the slugs that I have been unable to keep it. The recent notes on *L. pubescens* are particularly inter-

The preparation of pot trees, both cordons and pyramids, has received the attention of leading fruit nurserymen of recent years, and before making a start any intending grower will do well to get a stock of trees specially grown for pot culture, which may be obtained at prices varying from 3s. 6d. to 5s. each.

The first essential is a suitable house, and in the erection of this the object is to secure the utmost amount of light and ventilation. Span-roofed houses are very good, and if they are built with wooden sides, which will open in sections along their entire length, so much the better. It is usual to have a pathway down the middle, and to stand the pots containing Cherries and other fruit trees on either side. In the case of a lean-to house single cordon Cherries may be trained on the back wall. It is advisable to have some heat, and for ordinary purposes a single row of 4-inch pipes running all round the house is sufficient.

Soil and Potting.—As a rule 10-inch and 12-inch pots are suitable for Cherry trees, and it is most important that they should be thoroughly drained. As Cherries are averse to much root disturbance over-potting must be strenuously avoided, and when trees are well established top-dressing is better than potting every year. When the latter operation is necessary it is best done at the end of September or early in the following month, the trees being placed in similar or larger pots, according to their condition. Fibrous loam, pulled in pieces about the size of a Walnut, is the staple material for either potting or top-dressing, and to this may be added one part of thoroughly decayed manure to three parts of the former, with a free sprinkling of mortar rubble and a few crushed bones. A portion of the soil should be removed from the sides and surface of the ball, and then the latter be placed in the centre of the fresh pot. The compost must be made firm evenly round the sides of the pot with a blunt potting-stick, and the old ball be also covered to the depth of about an inch. When top-dressing is substituted for potting the surface soil is pricked up and removed, along with a portion of that down the sides, by means of a sharp peg or a bent piece of iron, and the space filled up with compost.

Considering that the trees are only provided with a very limited root space the necessity for feeding arises. While in a state of growth liquid manure must be given in fairly liberal quantities, and it is also a good plan to fix zinc collars inside the rims of the pots which will allow for surface dressings of rich compost, through which the roots freely percolate.

Pruning.—The fruiting area of pot trees being restricted, it is desirable that every possible inch of wood should be furnished with fruit-spurs. To attain this object, and also to avoid much knobby work, a system of summer pinching as advised for garden trees outdoors, should be practised. Very little extension can of course be allowed, but in the case of established trees having branches well clothed with spurs not much extension growth is made.

General Treatment.—When the trees are brought indoors in the spring they should be well syringed once or twice a day, and though this operation must of course be stopped during the flowering period, it should be continued again when the fruit is swelling. Very little artificial heat is required to maintain a genial buoyant atmosphere, and on all favourable occasions ventilation should be allowed. Watering must be carefully done, and an over supply be avoided or the result will be sour soil, which is fatal to the health of the trees. After the fruit is gathered the trees may be stood in a sunny position outdoors, and have some straw or Bracken packed round the pots to prevent the sun from drying the soil too quickly. A position outdoors is the best for the trees in the winter. They should be plunged up to the rims of the pots in a bed of ashes, and in the event of severe frost be further protected with litter or Bracken piled round and over the pots. In this manner the trees are wintered safely, and will soon commence action when placed under glass in the early spring.

Varieties.—The following is a short selection of excellent varieties suitable for pot culture:—

Duke, Early Rivers', Governor Wood, Belle d'Orleans, Royal Duke, and Empress Eugénie. It is needless to add that this list may readily be extended, and that all trees intended for pot culture should be worked on the Mahaleb stock.

ENEMIES AND DISEASES.

Birds are the bane of ripe Cherries, and unless some preventive measures are adopted it is hopeless to expect a crop. Trees under glass can of course be protected against the feathered tribe, and when only a few Cherries are grown I would advise dwarf trees, which can be netted. In Orchards clappers and scares may be used when the fruit is ripe, but nothing is so efficacious as a gun, and so persistent are the birds that the "Cherry tender" must keep a close look-out from the early hours of the morning as long as daylight lasts. Black aphid (*Aphis cerasi*) is the greatest enemy of the Cherry in the way of insects, and should never be allowed to make headway. With trees under glass prompt fumigation will check it at once, and specimens outdoors that are affected should be sprayed with a solution of quassia and soft soap or other approved insecticide. Trees in pots are liable to be affected with red spider, and an attempt should be made to avoid it by maintaining a moist atmosphere by syringing and free ventilation. Slugworms are objectionable pests, and when they attack Cherry trees soon make short work of the foliage if not promptly checked. Two or three dustings of lime repeated at intervals of a few days will generally rid the trees of the trouble.

The exudation of gum, so common amongst Cherries, may be traced to a variety of causes, including bruises, bad union of stock and scion, unripened wood, imperfect drainage, over-pruning, and the absence of some essential element in the soil, generally lime. It will be seen then that to a certain extent it is in the hands of the cultivator to avoid gumming by care in the handling of trees and the preparation of the soil. As a remedy surface-dressings of lime in some form are good, and maintaining a free growth by adequate feeding.

G. H. HOLLINGWORTH.

NOTES ON HARDY PLANTS.

ANEMONE POLYANTHES.

SOMEWHAT in the way of the European *A. narcissiflora*, but of more robust habit, the Himalayan many-flowered *Anemone* is a common plant in Kashmir and Sikkim at elevations of 10,000 feet and 12,000 feet. It is usually found growing in moist shady places. A similar position should be selected for it in the rock garden, where it occupies a foremost place among the choicest plants. Though introduced over half a century ago it is still an uncommon plant in gardens. The large white flowers are sometimes 2 inches in diameter, and borne in compound umbels of often twenty flowers on stout petioles exceeding 1 foot in height. An additional attraction is the silky appearance of the whole plant, which is covered with silky hairs. The illustration shows a plant growing on the north side of a stone in the rock garden at Kew.

W. IRVING.

THREE HARDY GERANIUMS.

GERANIUM SESSILIFLORUM AT BITTON. — Nearly fifty species of *Geraniums* are to be found mentioned in the "Kew Hand List," and even these but a tithe of the hardy members of this genus

which have been described by various authorities. Some of these have probably never been introduced to English gardens, and many are doubtless unworthy of cultivation. Quite recently I was very pleased to meet with a species which is as rare as it is beautiful. It was my privilege during the last week in June to be allowed to spend an hour or two in Canon Ellacombe's most charming and interesting garden at Bitton, and the Canon himself was good enough to show me some of the most noteworthy and beautiful plants in his collection. We were walking down the path in front of the long and sheltered south border when, among the numberless little dwarf rock and carpet plants which fringe the stone edges of this border in such a charming manner, I saw in the distance what at first sight appeared to me to be an enlarged form of *Erodium chamaedryoides*, but which on closer inspection proved to be the dainty little *Geranium* which forms the subject of this note. The remarkably thick green leaves, between which peeped the almost stemless flowers, that are white veined with purple, formed a lovely little floral carpet but an inch or two in height. It is synonymous with *G. brevicale*, and a description

hardy *Geraniums* is tried it should be done in spring just after the plants have begun growing. Another species,

Geranium argenteum, a deservedly popular plant, is one of the most delightful of the whole genus, and has been very good with me this year. It attracts the attention of even the most unobservant visitors, not because its blossoms are of brilliant colouring, but from the fact that the whole plant is so neat in appearance. The tufts of silky, silvery leaves, surmounted by the rose-coloured flowers, are most attractive, and it is one of the choicest gems for the rock garden with which I am acquainted.

ARTHUR R. GOODWIN.

NOTES FROM SCOTLAND.

THERE has been not a little grumbling about the want of Cauliflowers, accentuated, as it has been, by late Broccoli having turned in earlier than usual, so that during the month of June there was a regrettable gap in the supply. Much of the loss and dissatisfaction might have been discounted if, instead of Early London being solely cultivated in

THE RARE ANEMONE POLYANTHES IN THE ROCK GARDEN AT KEW.

of it is given in Hooker's "Handbook of the New Zealand Flora," page 36. It seems to prove hardy at Bitton, and appears to flourish in just such a position as suits the little *Erodium chamaedryoides*. I do not think that it is in commerce, but seed ought to be obtainable from one or other of the New Zealand seedsmen.

Geranium subcaulescens. — I noticed this bright little plant in flower on the rock garden at Kew at the end of last month, and mention it here because its merits must be unknown to many amateurs, or else it would surely be more cultivated. Many of these hardy *Geraniums* are difficult to propagate as they have a tendency to form but one root-stock; it is almost impossible to divide successfully. Neither do cuttings meet with success because the shoots sent up are usually only flowering stems, which refuse to root. Fortunately, many of the species seed pretty freely, and this is the case with the plant under notice; but to ensure success I find that the seed should be sown as soon as possible after it is gathered. *G. subcaulescens* has roundish, downy leaves divided into five segments; the flowers are rosy violet with veins of a darker colour. It is well worth a sunny position in the rock garden in sandy loam. If division of these

many gardens, one of the early-forcing varieties had been substituted, and the seeds sown under glass in January instead of the autumn. It is seldom that late Broccoli and one of these early Cauliflowers fail to overlap, but this year we had the interval of a week between the end of the first-named and the commencement of the other. Large and beautiful heads of Methven's strain are being out. The plants are much more robust than some of the early-forcing sorts, and only slightly later. In your report of the York Gala a slight mistake was made in describing the

NEW APRICOT-COLOURED CARNATION

Francis Samuelston as a tree. By the courtesy of the raiser I had three small plants in spring, which show none of the characteristics of the tree section. In addition to its glorious colour the plant is quite upright in habit, very floriferous, and, as twenty-two shoots are ready to layer, also free of increase. In grass and growth it is, indeed, similar to Mephisto. I have another variety from the same raiser, apparently from the same seed-pod, as it is in all respects similar, save in colour, which is brick red. It is named Muriel Samuelston. I anticipate that both sorts will become popular

garden varieties, though, judging from the many failures in constitution that have occurred in the past with new varieties, time is necessary to determine that.

FRUIT AND FLOWERS AT NEWBYTH.

It is seldom that really good Strawberries can be gathered off plants of Royal Sovereign in the garden here, the soil being light. My own experience points to the conclusion that it is fit to grow only as a forcing variety. Yet at Newbyth, Sir David Baird's place, it produces enormous crops of magnificent fruits. Mr. Thomson told me, when lately I called to see some of the good things in the garden there, that he had gathered as early as June 18 from plants set out last September. These were producing finer fruits, but two year old plants were carrying the larger crop. Newbyth has long been noted for its superior hardy fruits, Peaches in the open being particularly well done. This year they are, unfortunately, a comparative failure. Enormous quantities of hardy flowers are cultivated in the borders alongside the walks in the kitchen garden, rendering that generally prosaic enclosure gay and always pleasant to ramble through. A distinct and pretty strain of Sweet William is largely cultivated, and is attractive and sweet.

R. P. B.

ROSE GARDEN.

ROSE VISCOUNTESS FALMOUTH (H.T.).

ONE of the first of the late Mr. Bennett's results in cross-fertilising the Rose was the above. Though a fairly good variety it never made many friends in this country, probably because, with others, it was introduced with rather a flourish of trumpets. The first few Mr. Bennett sent out were decidedly disappointing, although how far they were used in producing the splendid results of his later efforts no one probably will ever know. I do not suppose there is now an English catalogue that contains the name of Viscountess Falmouth, but it is found in many foreign ones. The flowers are of a rich rosy red colour, and are very large when well grown. The form is globular, the blooms being fairly full and very sweet-scented. It is a useful variety for winter blooming, as is Duke of Connaught, another variety of the same year (1880). Mr. Bennett said he obtained this variety by crossing the Tea Rose President with the Moss Hybrid Souper et Notting. He was certainly wise in using President as the seed-parent. I am persuaded we shall yet obtain some glorious Roses by going back to the old varieties and using them for hybridising.

ROSE CLIO (H.P.).

An exhibition tent is not the best place to see this beautiful Rose, but when seen growing upon the plant it is one of the best of the sturdy Hybrid Perpetuals. Its vigour and freedom of flowering commend it to all who are anxious to obtain Roses that may be depended upon to grow well. Clio is not a good autumnal, and the same may be

said of quite a number of our popular Hybrid Perpetuals; but I should not discard them on that account. The colour is blush white with the delicate pink shading of the Celestial Rose, the latter a near relation to Maiden's Blush. I am confident that we do not obtain half the beauty that is possible with these Hybrid Perpetuals. Let them be treated as 3-foot to 4-foot pillars, and see how beautiful and showy they will become. The growths may be pruned irregularly, some being left 1 foot long, others 1½ feet, others 2 feet, and so on, and a pillar of blossom is the result.

PHILOMEL.

ROSES AT WOLVERHAMPTON.

ALTHOUGH the effects of the season were plainly visible on many of the blooms, several very fine boxes were staged at this show on the 7th inst.

ROSE VISCOUNTESS FALMOUTH.

In the premier class for seventy-two varieties, Messrs. R. Harkness and Co. of Hitchin were placed first, and their exhibit contained some splendid flowers. The following were particularly fine: Mme. Cadeau Ramey, Golden Gate, White Maman Cochet, Mildred Grant (a superb bloom), Frau Karl Druschki (an exquisitely shaped flower), Mrs. Edward Mawley, Mrs. J. Laing, Bessie Brown (a huge flower), Louis van Houtte, and Duke of Wellington. Messrs. B. R. Cant and Sons were placed second. Their stand included a superb flower of Helene Guillot (pearly white, with a salmon-pink centre, and very shapely), Jean Ducher, Ben Cant (a splendid colour, but rather undersized as shown), Ellen Willmott, Robert Scott (a lovely clear pink), Souvenir de President Carnot, and Medea. The third prize went to Messrs. D. Prior and Sons, whose stand included

fine examples of Emilie Gonin, Muriel Graham, and Horace Vernet. Five splendid flowers in Messrs. R. Harkness and Co.'s exhibit, which secured the first prize for forty-eight distinct varieties, are specially worthy of mention. They were Lady Clanmorris, Liberty, Captain Hayward, and Marquise Litta. For eight distinct varieties, three blooms of each, Mr. George Mount was easily first with a magnificent box, which was quite a centre of attraction. The varieties were Mildred Grant, Bessie Brown, Frau Karl Druschki, Mrs. W. J. Grant, Ulrich Brunner (very well shown), Caroline Testout, Mrs. J. Laing, and Marchioness of Londonderry. The class for

TWELVE NEW ROSES

brought a capital exhibit from Messrs. B. R. Cant and Sons. In this exhibit one flower—I refer to Prince de Bulgarie—probably attracted more attention than any other variety. The outer petals are of a rosy orange colour, the centre suffused with intense salmon-pink. Its fragrance also is delicious. Mme. Jean Dupuy may be summed up as a pink Francisca Kruger, and we can only hope that it will grow as well as does this latter. Fru Peter Lambert did not appear to me to be nearly so shapely as Kaiserin Augusta Victoria, although stated to be a pink form of this variety. Edmond Dashaes was also shown, but did not strike me as being distinct enough to be wanted. In the class for nine distinct varieties of Teas and Noisettes, to be staged in vases, seven blooms of each, Mr. G. Prince had a beautiful exhibit, which easily gained the first prize. The varieties, which were tastefully staged on black velvet, were Innocent Pirola, Souv. d'un Ami, Souv. S. A. Prince, Marie van Houtte Medea (extremely beautiful), E. Gifford, Mme. de Watterville Maman Cochet, and White Maman Cochet. An extremely interesting class is that for twelve dark Roses and here Mr. Mount again was with a superb box of Liberty beating several exhibitors who had relied upon A. K. Williams. In the class for twelve light Roses Mr. G. Prince carried all before him with Mildred Grant, who Messrs. Townsend were seen with Bessie Brown, both very fine exhibits.

A. R. G.

DAFFODILS FROM SEED.

I HAVE just read the Rev. S. E. Bourne's very excellent little book on Daffodil culture, "The Book of the Daffodil," which is practically a reprint of a paper read by him at the Malvern

Hall in April, 1900, with some additions, notably a list of all Daffodils that have been certificated by the Royal Horticultural Society up to last year, a very useful list of really good flowers that have not received an award, and a chapter on "Cross Fertilisation and Seedling Raising." This chapter would have been more useful to beginners if a list had been given of varieties that seed freely and of the most useful pollen flowers. In the hope that others may give us their experiences in this direction I append a list of Daffodils that I have found good seed bearers. My experience only extends over about five years, so that my list must naturally be very incomplete, but when I started raising seedlings such a list would have been a great help to me. It can

arises, for the most part, good cheap varieties that can be recommended to a beginner for this purpose.

FREE SEEDERS.

M. J. Berkeley, almost every flower crossed sets seed; Apricot, every flower I have crossed (for two seasons) has set seed; Golden Prince, very free seeder.

GOOD SEED BEARERS.

Mrs. Thompson, Chaucer, Comus, Weardale, Minnie Hume, Firebrand, Princess Mary, Princess Louise, Cassandra, Ornatus, Cernuus Pulcher, Mrs. Burbidge, P. R. Barr, William Goldring, Mme. Plomp, and Emperor.

FAIR SEEDERS.

Horsfieldi (usually very few seeds in each pod), Mme. de Graaff, Baroness Heath, Mrs. C. Bowley, Maximus, Flora Wilson, Gloria Mundi, James Bateman, Poetarum, Mrs. W. Ware, Princess Ida, and Golden Spur.

Of the following I have only had seed from a small percentage: Nelsoni major, Shakespeare, Glory of Leiden, C. J. Backhouse, Jeannie Woodhouse, and Ellen Barr.

From many varieties I have never succeeded in getting any seed. Empress is one of these, also John Nelson, Captain Nelson, George Nicholson, M. Magd. de Graaff, Sir Watkin, William Wilks, and Crown Prince. I should very much like to know if anyone has succeeded with Crown Prince, as if it can be induced to seed it ought to be a splendid flower to breed from. I have entirely failed with it also as a pollen flower.

GOOD POLLEN FLOWERS.

Most of the Poeticus varieties, Ione, Triandrus palatinus, Golden Spur, Santa Maria, Mme. de Graaff, Lulworth, H. E. Buxton, William Goldring, Mrs. Burbidge, W. P. Milner, Obvallaris, Stella superba, Triandrus albus, Emperor, Gloria Mundi, Monarch, and Flora Wilson.

The largest number of seeds I have had out of one pod was eighty-three from Jeannie Woodhouse, every single seed of which germinated.

Scotland.

N. B.

GENTIANA ACAULIS.

FOR its bright display of blossoms in the early spring and summer, the old garden Gentianella is among the most prized of all hardy carpet plants, and on some soils is by no means difficult to please. In other districts, however, the plants are invariably unhappy, and while growing freely, or rather forming patches of rather diminutive growth, fail to give anything like an adequate flowering. This may be, of course, due to neglect rather than anything else, or, again, some deficiency in the soil may, in a measure, account for the poor growth. Too frequently the large patches are left too long without disturbance, which with this species is an error. It is equally wrong, inasmuch as only inferior results ensue when the plants are pulled to pieces and planted, as they are quite frequently, in spring at flowering time. During the latter period many hundreds of plants are sold because attractive, though the future of the majority of such plants would not prove very encouraging if followed up. Where the plant thrives it should be made much of, and no season in the whole year is so well suited

THE GENTIANELLA (GENTIANA ACAULIS) IN A SURREY GARDEN.

to dividing and replanting as September. Planted firmly in good ground at any time during September or October, the losses are reduced to a minimum, the plants take readily to the soil, and continue making stoloniferous growth nearly all the winter, a fact that may be verified in the ensuing spring when the young shoots appear above ground. Overdense patches often fail to flower freely, but with room for development they produce one of the brightest displays of spring.

THE FERN GARDEN.

ECCENTRIC FERNS.

FERN varieties may be classed under two heads—beauties and curios—and, though the former undoubtedly claim first place in collections by virtue of their symmetry and thoroughbred character, the latter are by no means devoid of interest to the student of Nature. The lowest class of curios, so to speak, are the “rogue” members of the Fern family which appear to be trying to vary, but cannot do it properly, and among our native species it is the Male Fern which displays this tendency the most, since specimens are by no means uncommon, in which some of the fronds differ from the normal ones in forking and varying in other ways. Sometimes, indeed, the whole plant is so characterised as to entrap the beginner in Fern hunting into the idea that he has found a prize, while the chances are a hundred to one that when transferred to his garden it resumes its normal character partially or wholly. The writer found a grand specimen of this kind in Scotland, in which all the fronds had abnormally long side divisions, and the sub-divisions of these were prettily cut and set so far apart as to render the plant an acquisition. Dug up and potted it immediately produced a set of common fronds, perfectly normal. Next season, however, it resumed its form as found, and, being then divisible, was divided, one being potted, the other installed in a congenial shady position in the open. Result—a good variety in the pot and an absolutely normal plant in the open. What subtle influence can determine so marked a structural change no one can say. It is not determined by exposure, for, as

we have seen, the plant was found in the open, and, moreover, the abnormal character is perceptible directly the frond begins to uncoil, so that it is not a question of subsequent influence, but begins in the crown. This instability is usually very difficult to breed out; it is as a rule inherited and transmitted generation after generation. That charming Lady Fern (*Athyrium filix-femina* Kalmthout) has been raised presumably by the thousand, but all the plants we have seen show, sooner or later, a few pinnae or an entire frond of much wider and tougher make, and, what is more, its spores invariably yield a percentage of plants so characterised throughout (*A. f. f. plumosum* Stansfield), without, however, the least tendency to vary again into the Kalmthout type.

Here, beyond a doubt, it is a case of simple, partial, or entire reversion. That beautiful Polypody, *P. vulgare cornubense*, is a precisely similar example, except that it goes a step further by bearing three kinds of fronds, viz., the very finely dissected ones of the type, a coarser make of this, and perfectly normal ones. An odd feature in this plant, and a truly eccentric one, is that here and there the side divisions of these normal fronds may be of the best dissected type, or all three types may appear piecemeal on one frond, as it were in patches. This Fern, crossed with a crested form, exhibits its eccentricity still more markedly, for now we have five or six different kinds of fronds, viz., normal, normal but crested, dissected, crested, and uncrested, and the intermediate type ditto, showing that the varietal and normal influences have not properly combined, and are still capable of asserting themselves independently here and there. This again is obviously due to reversion. The class of “eccentrics” known as truncate differ in being constant and of a type which cannot be imputed to specific influence. In these the frond and its parts are normal up to a certain point, at which, however, side and terminal growth suddenly ceases, the midrib continues a little way as a thorn, and the ends of the frond or pinnae terminate squarely or with a sort of pouch, or they may finish up roundly with the midrib projecting at the arc of the semi-circle as a Thorn, either in front of the frond or the back of it, according to the variety, but never indiscriminately. In the Lady Fern we have this exemplified in *A. f. f. excurrens*, all ends square, and a long bristle protruding; in the Male Fern (*Lastrea filix mas truncata*) it is precisely the same, but with a short thorn; in *L. montana* (the Lemon-scented Fern) this form

occurs so frequently that among Fern hunters it is known as "the beginner's find." In the Hart's-tongue, however, we have most examples, and these are known as the pouch-bearing type, in which there is a pouch, pocket, or rosette-shaped cup at the frond end, the midrib projecting from the centre; and the cornutum or horned type, in which the frond is abruptly rounded off, with the midrib projecting behind or before, as above stated. This character is truly transmitted by the spores, and has even been combined by crossing with other types. We have a variety raised by ourselves, in which the usually rounded basal lobes also bear pockets, *Scolopendrium vulgare triperiferens*, or, as we tell our friends, breeches-pocketum. In *Polystichum angulare*, or Soft Shield Fern, we have truncatum forms, with square-topped fronds, but, curiously enough, considering the wonderful tendency of this species to vary, we know of no thoroughbred variety of the *excurrens* type, i.e., with the side divisions thorned and truncate also.

Another form of eccentricity is seen in Ferns of the lineare and mediodeficiens types. In these the small divisions next the midribs of frond and pinnae are either quite absent or reduced to rudimentary thorns; examples of this are found in the Lady Fern, Male Fern, and Shield Fern. This peculiarity is also truly transmitted. Naturally, where the gaps are irregular these Ferns are unsightly, but there are several forms of Lady Fern in which both fronds and pinnae are evenly open along the centre, giving them a light and graceful appearance. We might, of course, carry our theme of eccentric Ferns into many other varieties, but space compels us to limit ourselves to a type or two, and the above are certainly the most striking and interesting.

CHAS. T. DUBREY, F.L.S., V.M.H.

GARDENING OF THE WEEK.

FLOWER GARDEN.

ROSES.

BEFORE these get past their best it is advisable that notes be made of the colour and good or bad qualities of unfamiliar varieties. Now is the time to condemn certain sorts for weeding out to make room for others of a better quality. Some varieties do better in a certain situation or on a particular stock; notice should be taken of these facts. As the foundation of a good deal of work for the rest of the year may depend upon a few days observation, all flowers should be cut as soon as they are faded. Should mildew become troublesome every effort must be made to keep it under. Hoeing should not be neglected, or watering if the weather is very dry. The budding of Tea Roses will now have commenced on Standard stocks, and the work should be persevered with. Stocks often suffer from stagnation of sap in August, and where Tea buds can be had in sufficient quantity it is best to bud early, as these invariably stand the winter better than those budded later in the season.

DAHLIAS.

These just now will perhaps claim more attention than most plants, especially if the weather be dry. Dahlias cannot possibly make headway in a dry soil; they must have moisture and plenty of it or there will be no blooms fit for the exhibition stand. Give them water two or three times a week in the evening. It is no use pouring it on the surface for the greater part to run away. Scoop out a hollow round the plant, fill it with mulch, and water through that. Thin out the growths where necessary, examine the stakes and tie bands, and disbud where too many buds make their appearance. Earwigs, caterpillars, snails, &c., must be searched for, or great injury will quickly be done to the young shoots and buds.

VIOLETS.

These, if not already done, should have a good surface mulching of short manure; such as would be shaken out for Mushrooms will be found very

beneficial, and a good soaking of water to follow. This should be repeated at intervals if the weather is dry and hot. Red spider and other insects are by no means partial to the aroma that follows the soaking of fresh manure.

CLIPPING HEDGES.

Attend to the clipping of hedges. If they are neglected and long woody growths are permitted to form the symmetry of the hedge may be destroyed, for most evergreen plants suffer more from a severe cutting down than from frequent clipping of their small twigs.

T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

THE KITCHEN GARDEN.

EARLY POTATOES.

THESE may now be lifted while the ground is in a fairly dry state, for should much rain occur, especially on stiff soils, the disease may set in. The sooner this crop is lifted and carefully stored after the skins are set the better. Hoe and clean the ground in readiness for some late crop, as Turnips and Spinach for winter, Lettuce, Endive, and late Savoy. No digging or manuring will be necessary for these crops, provided a dressing was given for the Potatoes. Other ground that has been cleared of early crops, as Peas, Beans, and Cauliflower, should be treated likewise.

CABBAGE FOR SPRING.

Much depends upon the locality and nature of the soil as to the date for sowing the seed. Generally speaking, gardeners have a fixed date which they know from experience to be about right for their particular district, but to those who have not had opportunities to note this it is a good practice to make two sowings, viz., one about this date and the other a week or so later. He then makes sure that one batch of plants will be about right. Where the soil is heavy and cold the first sowing should be made at once. Prepare the seed bed by treading, raking level, and watering the day before. Then sow the seed broadcast and cover with mats if the weather be hot and dry. This will conserve moisture and hasten germination. Sow thinly, and when the first rough leaf appears remove a few of the superfluous plants in order to ensure the remaining ones being sturdy. Sow varieties that come into use early and are not addicted to bolting. Good strains of Ellam's Early and Flower of Spring are hard to surpass.

HERBS.

The present month is opportune for cutting down many kinds of herbs for the purpose of drying in an airy shed for use in winter when green herbs are scarce. The growths should be firm and fully developed, as then the full flower of each kind is ensured. A crude method adopted in some gardens is to merely hang up the bunches and use them as required, whilst a few gardeners have the leaves rubbed down to powder, or nearly so, then bottle and properly label them. Of course, the latter method has its advantages if time can be spared on wet days for the operation. The herbs must, of course, be perfectly dry when gathered, also when bottled, and the bottles must be made quite air-tight.

Stonleigh Abbey Gardens.

H. T. MARTIN.

THE FRUIT GARDEN.

PLUMS AND CHERRIES.

If any of the Bigarreau and other late kinds of Cherries are still hanging on pot trees they will be the better for removal to a cool, airy place where they can be effectually protected from sun, rain, and birds, and, space being limited, the very early Plums may be placed out of doors to ripen. The finer varieties, including the Gages, Jefferson's, Coe's Golden Drop, Coe's Late Red, Ickworth Imperatrice, and others, which are so much improved by being grown and ripened under glass, may then be rearranged for the season. If any of the second growths are starting away freely, as they often do after the stoning is complete, let them be stopped at the third or fourth joint, otherwise they will rob the fruit of food and deprive it

of sunshine, of which these cannot have too much, provided they are properly supplied with air and water. Look well to the mulching, add more as it is required, feed well with good liquid, and syringe twice a day with clean soft water until the fruit begins to change for ripening. If any of the

EARLY POT CHERRIES

from which the fruit has been gathered require potting it is a good plan to give them a shift before they are taken out of the house, and as the latter will be kept like a warm orchard house, the soft humid atmosphere will favour the rapid formation of fresh roots. When new growth has set in no time must be lost in getting them removed, first to a sheltered shady place for a few days, thence to a dry open situation where they can be plunged and mulched to save watering.

PEACHES AND NECTARINES.

When all the young growths actually require for forming the trees have been nailed or tied in the final thinning of the fruit will follow without delay, as it rarely happens that fairly-treated trees lose many fruits at stoning time. Where time-attention is paid to selection of the fruit for the crop preference should always be given to the finest on the upper sides of the shoots, and taking the whole area of the wall covered with foliage, about one Peach to the square foot will be found quite sufficient for ordinary trees to carry. For this time forward the principal work will be keeping the foliage clean and free from insects, the most troublesome of which are black fly and red spider. The first may be destroyed by the persistent supply of tobacco water, and the second makes but little headway where the borders are well mulched and the engine is vigorously applied at the close of the day. The proper balance of the trees must also be kept in view, otherwise the right and gross shoots, while robbing the fruit, will greatly interfere with the extension of the leading branches.

STRAWBERRIES.

Young plants intended for making new plantations should be taken away from the parent stock as soon as the small pots are filled with roots. If the ground on which they are to be planted or be cleared of the spring crop, which generally consists of early Peas or Potatoes, lose no time in getting it well manured and broken up to a depth of 18 inches or 2 feet; add another dressing of manure, fork it in near the surface, and tread firmly. Set out the lines 2 feet 6 inches apart, so that the soil of the young plants is thoroughly wet when they are turned out, and place them 15 inches from each other in the rows.

Madresfield Court.

WILLIAM CRUMP.

GARDENS OF JAMAICA.

(Continued from page 431, Vol. LXIII.)

LEAVING the sea coast we may again traverse another chain of mountains to meet with new scenery and fresh spots of interest. We pass through the parishes of St. James, Hanover, and Westmoreland. It is in this part of the island that the finest Cotton Trees are found. These are to be carefully distinguished from the Cotton plant, which is a mere shrub, and would hardly be worthy of notice were it not for the value which manufacturers have placed upon its products.

THE COTTON TREE

is of gigantic size, and equalled by few other trees in any part of the world. It is so called because it produces a thin silky cotton, which is unsuited, but from the shortness of the supply and the nature of its texture, for the purposes of manufacture. One peculiarity of its form is that the high trunk is perfectly straight, and rises to a great height before it throws out any lateral branches. To support this immense mass the tree has great spurs at the roots. The space between these spurs is often so great as to be wide enough for the stabling of horses. Of these trees, one at Hopeton, in the parish of Westmoreland, is about the finest. Its proportions and symmetry are so great that no

estimate can be formed by the eye of its prodigious size. But an observer on the spot estimated that the trunk reached the height of 200 feet ere it struck out any lateral branches, and the trunk itself was 13 feet in diameter. The root spurs of one at the town of Mandeville have remarkable proportions, and it is common to see groups of horses and mules resting between these high projections. The Cotton Tree is seldom used for any other purpose than that of making canoes. These are the native boats which are formed from one trunk; they are hollowed out, and are capable of taking in a considerable number of men and a considerable quantity of cargo.

The Cotton Tree is one of the few deciduous trees to be found in the country. Towards the autumn the leaves begin to fall off, and after a time the branches become perfectly bare.

A large and graceful tree is found occasionally in the mountains, but grows more luxuriantly in the lowlands. It is

THE TAMARIND.

Its foliage is of a pale green, light and beautiful. Some of these trees have the peculiar rounded form of the Mango; but it is generally more irregular in its shape. The fruit hangs from every limb, and has the appearance of a large Bean. When it ripens the skin of the Bean becomes brown in colour; it is easily removed, when the pulp is eaten from the seed. Most persons are familiar with the taste and appearance of the Tamarind when according to general use it is preserved and sent to England. In this state it may be made into a very agreeable beverage, the acid being extremely pleasant.

A group of trees attracts our notice covered with a large green fruit; that is

THE PEAR.

When we speak of the Pear, a very different fruit must be understood to that which is known in England by that name. Indeed, its nature is such that we hardly know whether to speak of it as a fruit or a vegetable. The shape of the fruit is very like that of our Pear, but it is much larger, and has a more tapering neck. Its colour is generally does not vary, being green when it is quite ripe. There are a few sorts, however, which become purple when this is so. The Pear should be gathered before it is ripe. It is known to be so by the shaking of the stone within; indeed, the experienced eye knows this from observation. When gathered, it is put in a warm place, or, what is better, covered with some kind of grain. In a few days it will be fit for use. The outer skin is then cut with a knife, and affixed to it is found a firm substance of the consistency of marrow, from three-quarters of an inch to 1 inch in thickness. There is a large stone within. This marrow substance is eaten with salt and by some persons with pepper also. Animal and other vegetable food is eaten with it, and there is no meal at which it is not used. There are few persons who do not from the first like its flavour and taste, but after a time everyone is wont to pronounce it to be the most delicious of all vegetables and fruits. Its proper name is the Avocado Pear.

There is another fruit-bearing tree which is very remarkable in its character. The wood of

THE CASHEW,

like that of most fruit trees, has but little value. But it produces a Nut, which by many persons is esteemed to be the very finest that can be found in any part of the world. But this Nut grows in a most curious way from the end of the fruit, which is almost the size of a small Pear. The colour of the fruit is yellow, and the Nut pale brown of a kidney shape. The Nut is enclosed in a very thick shell, the oil of which is so pungent that if the lips are touched with it it blisters the skin. The usual way of separating the shell from the kernel is to place it in a light fire made of thatch leaves, taking care to remove it as soon as the shell appears to be well roasted. They may also be eaten in their uncooked state, and if placed in salt and water they are particularly agreeable. The

least nine months in the year it is possible to obtain Oranges.

The tree grows as luxuriantly in the mountains as it does in the lowlands, but the quality of the fruit is very much better in the latter parts. Like the Mango, it grows wild or is grouped together in the open fields. In all these cases Oranges may be taken in numbers by anyone who wants them. The people from the country take them into the town markets, where baskets of them may be bought for a very small sum. Perhaps there are no Oranges produced in any part of the world, except Jaffa in the Holy Land, which may be considered superior to those of Jamaica. There are several sorts of Oranges. The Seville of Bitter Orange is that which is used for preserving.

We are now among the rocks and precipices or some parts of the mountains of the parish of St. Elizabeth's. This is the character of portions of the mountain range, but most of it is rich and fertile. In the midst of these rocks

THE ALOE

grows in great luxuriance. It seems to thrive best where the roots manage to penetrate between the crevices of the rocks, and it is probable that from these there is a greater supply of moisture. We see them sometimes perched like a huge bird upon the edge of some precipice, at other times grouped together in masses on the most rugged places. They are rarely seen to flower in our

land, but in Jamaica the plant throws out its majestic flower when it is about three years old. The shoot proceeds from the centre, gradually rising to the height of 10 feet, 12 feet, or even 15 feet. From the top the pale yellow blossoms are thrown out, and when the Aloes are fine, few things can be compared to them for majesty and gracefulness of form. Soon after it flowers the plant begins to die, and as both the stem, leaves, and flower wither away the place is taken by another young Aloe.

When the shoot is young the top is sometimes cut off, and if some of the inner part is scooped out the sap rises and fills it like a cup. The action of the sun produces fermentation in the liquid, and it becomes thus a strongly intoxicating liquor.

The Aloe is commonly called in this country the Kuroatoo, and by some persons the Jamaica Maypole. An amusing story is told of a gentleman from Jamaica going to an exhibition of a "great American Aloe" in London, and his indignation at

finding that he had paid his shilling to see what he called nothing but a "Jamaica Maypole."

(To be continued.)

CATTELEYA WARNERI ALBA. (Two-thirds natural size.)

(Shown by M. Peeters, Brussels, at the recent Holland House Show. It then obtained a first-class certificate and a cultural commendation.)

fruit is too acid to be generally eaten, but it makes a most excellent preserve.

Throughout this part of the island

THE ORANGE

is found in great abundance. They form in some parts quite a hedge by the roadside. In others they are scattered here and there or grouped together in clumps. In some few instances they are planted in groves, which, when the fruit is ripe, present a beautiful picture of green and gold.

The Orange is too well known in our own land to need a lengthened description. It possesses the remarkable peculiarity of having the blossom, young, green, and ripe fruit on it at the same time, and this will account for the fact that at

CATTELEYA WARNERI ALBA.

ONE of the most striking plants at the recent Holland House Show of the Royal Horticultural Society was a plant of Cattleya Warneri alba, shown by M. A. A. Peeters, of Brussels. It had two strong growths, one of which carried a raceme bearing five lovely flowers, white except for the orange throat. A high price was asked by M. Peeters for this

plant. The Orchid committee gave it a first-class certificate, as well as a cultural commendation.

THE KITCHEN GARDEN.

CAULIFLOWERS IN POTS AND FRAMES.

DURING the past few years excellent varieties of Cauliflowers have been introduced, which give good returns in frame or pot. Few vegetables are of better quality when forced than the early Cauliflower, as grown thus there is an absence of that strong taste which many find objectionable.

In many gardens want of space would be the drawback to the growth of Cauliflowers under glass; but let me add fire-heat is not necessary, and what may be termed cold frame treatment only is required. In many gardens at the present day

of the country require glass protection a portion of that time, so that it will be seen what an immense gain the dwarf-early forcing Cauliflowers are. In many gardens good vegetables are none too plentiful in late May and early June, and the Cauliflower is more valuable then, as, though small, it is delicious.

Any of the varieties referred to, if sown in January or February, will give a May supply. I prefer to sow in pans or boxes in a warm house or frame on a hot-bed, and to place near the light. When the plants are well above the soil prick out the seedlings in boxes, or on a bed with a little warmth, and then when large enough transfer them to their growing quarters.

The plants, when they have made four or five leaves, are potted up in 6-inch pots. I have grown Snowball in 5-inch, but the plants of Sutton's First Crop are best in a larger size, and grown thus they take up little room, as they stand pot to pot for a time, and may be placed in the front of fruit houses, cases, or in cold frames.

In our own case we grow the plants in three different ways. An early lot is planted out on a warm bed of leaves and litter, frames being placed

stronger, and there is less fear of bolting if too much warmth is given at the start. I find the best results are obtained from plants planted out in cold frames. The heads are cut when about the size of a cricket ball. Planted out in March from seed sown six weeks earlier there will be good heads in May, and the plants may be grown much closer than on open borders. We give 15 inches between the rows, and a little more than half that distance, say 12 inches, in the rows. The frames when planting are kept close. In some seasons it may be necessary to cover the glass at night if growth is active. Another lot of later plants may be placed under hand glasses in the open on a south border. These give a succession, but for that purpose I should prefer pricking in frames from the seed-pan and the planting out.

By frame and pot culture there is no difficulty in having choice Cauliflowers when they are most appreciated, and at a small cost. Glass erections are now so numerous that frames can be spared in early vegetable crops. They can be used for a many plants that they are most valuable adjuncts to all gardens, as in autumn they are quite a valuable for sheltering plants or vegetables, especially salads.

G. WYTHE

THE CUSTARD MARROWS IN FRAMES IN SPRING.

THE trial of Vegetable Marrows at the Royal Horticultural Society's garden will be very interesting this year, as we may possibly get some good additions to this useful class. Although Custard Marrows crop less freely than the oval or long varieties, they well deserve attention, and when given a warm bed and frame crop much earlier than the open ground plants. There are several distinct sorts, the Bush, Cluster, or (as I call them) the Bunch, but I do not think these are equal to the trailing variety with ornamental fruit, as, though this requires more space, it is an easy matter to restrict growth by stopping, and thus secure an early set. I find that the Improved Custard crops much earlier than the Bush grown under glass, and earlier is a great gain. Another point is that these fruits must be cut young to get the best quality. If left to attain full size they harden, and are then dry and mealy. For early supplies the Vegetable Marrow is well worth frame culture, and even for open ground culture the Custard should be given a trial as it is so distinct from the other varieties. It makes a nice change in the vegetable supply, a point that should not be overlooked in gardens of any size. The plants continue bearing long time if the frames are removed and the supplies of food given in the shape of liquid manure.

S. H. L.

A SIMPLE AND EFFECTIVE METHOD OF PROTECTING STRAWBERRIES.

there are late fruit houses which would suffice to start the plants when given pot culture, and the frames are often available after winter is over. The value of Cauliflowers grown thus is that there is no break between the late Broccoli crop, such as Model and Late Queen, and the plants turn in just before the Peas, Beans, Marrows, and other choice vegetables.

For many years I grew Cauliflowers largely in Peach cases not forced, and at that time the varieties were not so dwarf or reliable. Such sorts as Early London take a longer time to mature than Sutton's First Crop and Veitch's Extra Early Forcing. These are admirably adapted for frames, and to them should be added Carter's Defiance Forcing and the older Snowball; the last-named, though very small, is one of the earliest.

The culture is most simple. There must be no break or check from the time of sowing the seed till the heads are cut. The old system of sowing in autumn is now superseded by sowing the forcing varieties, as these with good culture may be grown in about three months, or at the most four, whereas autumn-sown plants require nearly three parts of a year, and these latter in most parts

over the bed when the latter is made, and from 6 inches to 9 inches of soil given. Very little heat is required, as too much causes leaf growth, and at all times when the weather is favourable free ventilation should be afforded.

These plants turn in first, and grown thus there is no gap between the Broccoli and the first frame Cauliflowers. When frames cannot be given pots are used of the size named, and the soil employed is rich, but firm potting is required to get a sturdy growth. After the potting the plants are placed in any convenient position such as described above, but if frames are available there is no better place, as here the plants can be given more light and grown as firm as possible from the start.

I have grown pot plants in a variety of ways on stages or shelves, and also on the front borders of a cool fruit case, and by the use of pots the border is not soddened or injured. I do not advise the culture of the older sorts, such as Walcheren, in pots, though excellent results have been secured. These plants require more room.

For pot culture I prefer First Crop or Defiance. These are superior to Snowball, the leafage is

THE FRUIT GARDEN.

THE STRAWBERRY SEASON.

STRAWBERRY time is now with us, and those who grow these luscious fruits are usually obliged to take some steps to protect them from the ravages of birds—blackbirds and thrushes are especially fond of Strawberries. The old, and at one time universal, custom of covering Strawberry plantations with fish nets resting upon the plants is now superseded in many gardens by a method that has much to recommend it. Instead of the net being directly in contact

with the plants, it is raised at varying distances by means of woodwork. As shown in the accompanying illustration, the net is raised some 18 inches or 2 feet above the plants, while in some cases growers erect a wooden enclosure sufficiently high to allow a man to walk beneath and cover it with netting. For a narrow border as that here illustrated, however, such an erection would be altogether unnecessary. The advantages of a raised netting are that it effectually prevents birds from reaching the fruit, as they are still able to do when the net rests upon the plants, and there is no risk of damaging the fruit when gathering.

The nets can be easily removed from the low wooden structure, while from the higher one of course it is not necessary. For very large quarters covered with Strawberry plants it is well worth while to erect such a wooden enclosure as previously mentioned, high enough to allow one to walk beneath, say 5½ feet. This height permits an average man to gather the fruit without inconvenience and with far greater despatch than when the plants have to be removed and replaced. Unless the Strawberry quarter is fairly large it hardly pays to put up a protection of this description. When very early fruits are desired, for instance, from plants on a narrow south border, a low wooden framework, over which muslin blinds are rolled, hastens the ripening of the fruits very considerably, and the same framework may be covered with netting later in the season when the Strawberries are ripening.

When they have to be sent long distances Strawberries should be gathered early in the morning when they are cool, and as all those will now who send Strawberries by rail or road the fruit must not be touched with the hand if they are to reach their destination in the best possible condition. All handling should be done by means of the fork, and this is not difficult if the fruit is first gathered with a good fork. Packed singly in a Strawberry leaf and placed closely together in square shallow boxes, several of which are finally tied together, holding one layer only, and divided into four compartments, they will travel well. Line the interior of the box with Vine leaves (preferably young ones, gathered from a Vine out of doors) so as to ensure a firm base. It is a good plan to have a few leaves out of doors, simply for the production of leaves; for packing Strawberries, Peaches,ectarines, &c., they are invaluable.

Some varieties travel much better than others, and it is as well to bear this in mind when sending Strawberries to be sent a long distance. The fruits of some are so soft that it is next to impossible to ensure their delivery in good condition after a journey by train. Sir Joseph Paxton is a good variety to send long distances, also are Royal Sovereign and President. Unless is another variety safe to pack, and that is not nearly so widely grown as it would be. It is a large, brightly-coloured, wedge-shaped fruit, and has a distinct and aromatic flavour peculiar to it. The plants grow well and bear it freely if given good cultivation. Unless Strawberry is one of the oldest varieties, but we seldom hear it spoken of and

very rarely is it exhibited. Royal Sovereign seems to have eclipsed several really good sorts that formerly were widely grown, and this is a pity, because there are several Strawberries of much better flavour than Royal Sovereign. The days of quality rather than quantity seem to have passed away. Formerly cultivators were content with a fair crop, but liked to have their Strawberries of the best quality. Nowadays it is quantity that must be had, quality is a secondary consideration, and so a variety like Royal Sovereign holds the field. La Grosse Sucrée is an excellent Strawberry in most gardens, but is rather too soft to travel really well. Sir Charles Napier may be recommended to those who like a sharp flavoured fruit; it is firm, and travels well. It is not advisable to gather Strawberries when they are wet, for then they bruise so much more easily, and it is most difficult to pack them safely.

From time to time there has been much discussion as to what is the proper number of

STRAWBERRY "LEADER" IN A MIDDLESEX GARDEN.

years to keep a plantation of Strawberries. Some used to advocate two years, some three, while some advised destroying the plants after the first year's crop was gathered. It is, I think, generally admitted now that Strawberry plants produce the best fruits when one and two years old, but that in the third year a greater quantity of fruits is obtained, but they are much smaller; they are just as sweet however. The third year's crop is valuable for preserving, and those who make use of Strawberries for this purpose should certainly keep their plants three years.

The other illustration given of a plantation of the variety Leader, shows how well this old Strawberry fruits, and that its value is still recognised by some at least of our cultivators. The photograph from which this illustration was made was taken in a Middlesex garden, near London, so that it has an additional interest in showing what are practically town-grown Strawberry plants.

A. P. H.

SOCIETIES.

SUTTON ROSE SHOW.

ON the whole there was a very good exhibition on the 4th inst. in the grounds of Manor Park School. The committee and Mr. Nightingale deserve congratulations on the success of their efforts, and the day proved ideal for an event of this kind. The sale of flowers in aid of the funds of the Cottage Hospital, and a pastoral play, are two features of the occasion to which allusion should be made.

DIVISION A.—OPEN TO ALL AMATEURS.

The first class on the schedule (the Coronation Cup class) required a dozen flowers in distinct sorts, and Mr. A. Tate's set from his extensive collection at Downside, Leatherhead, was first, though Mr. E. B. Lindsell made a really good bid for the leading honours, which he must have missed by only a few points. The third place out of five entries fell to Mr. E. M. Eversfield with small flowers.

For two dozen blooms, Mr. Lindsell staged the best, though these were below the average in quality of the foregoing twelve; Mr. A. Slaughter was second with a very poor lot; and the third prize went to Colonel T. H. Pitt.

For eighteen varieties Mr. Tate beat Mr. E. M. Eversfield, and Mr. G. H. Baxter followed third. Messrs. Tate and Lindsell were placed in this order for the eight distinct trebles, the two sets making a favourable show, and magnificent samples were seen of Beattie Brown.

Five competitors staged each a dozen Teas and Noisettes in Class 5, Rev. F. R. Burnside leading against Mr. Tate, second; Mr. Eversfield, third.

DIVISION B.—GROWERS OF LESS THAN 1,000 PLANTS.

In the sixth class nine distinct blooms were required, and Mr. J. T. Thompson arranged a highly creditable selection, the second place falling to Mr. G. H. Baxter; Mr. E. Wilkins was third.

For the four distinct, in trebles, Mr. Thompson was first, Mr. Baxter being a good second, and Mr. Wilkins again came third. This was one of the best classes for quality of blooms in the exhibition.

In Division C, for a collection of garden Roses, there were no entries.

DIVISION D.—NURSERYMEN'S OPEN CLASS.

A brilliant array of five separate entries was furnished under Class 10 for thirty-six varieties, the first prize falling to Messrs. D. Prior and Son with generally very good flowers; Messrs. R. Harkness and Co. of Hitchin were second; and the third award fell to Messrs. B. R. Cant and Sons.

Messrs. B. R. Cant and Sons won premier place for the twenty-four distinct, having capital Roses. Second out of five came Messrs. Prior and Son. Messrs. R. Harkness and Co. were third.

Messrs. F. Cant and Co. led for the twelve Teas and Noisettes, and Messrs. Prior were again second. Messrs. Paul and Son, of Cheshunt, followed third.

DIVISION E.—LOCAL CLASSES.

The competition in this section was moderate, but some good and well set up flowers were on view. The leading awards were taken by E. J. Holland, Esq., for twelve blooms

in nine varieties. Second, A. E. Farnden, Esq. Mrs. West had the best nine distinct, and was second to E. J. Holland, Esq., for six Teas. K. H. Gifford, Esq., had the best half-dozen of one variety with Mrs. Laing, and E. E. Grimeson, Esq., came next with the same variety. K. Gifford, Esq., again won for the six distinct sorts in class 17.

ROYAL HORTICULTURAL SOCIETY. ORCHID COMMITTEE.

PRESENT: H. J. Little, Esq. (in the chair), Messrs. J. O'Brien, D. B. Crawshaw, H. T. Pitt, W. B. xall, M. Gleeson, W. H. Young, E. Hill, H. A. Tracy, W. H. White, and H. A. Biley.

At the tall end of the season one does not expect to see many Orchids, neither were they strongly represented on this occasion. The only group shown was from Messrs. Sander and Sons, St. Albans. This was chiefly noticeable for the hybrid *Laelio-Cattleyas*, which differed considerably in form as well as colour, the most attractive plants being *Laelio-Cattleya Martinetti*, L.-C. *Martinetti splendendum*, L.-C. *atro-rubens*, L.-C. *canhamiana*, C. *Mossiae reinckiana*, and *Oncidium m-cranthum*.

From Mr. W. H. Young, Orchid grower to Sir F. Wigan, Clare Lawn, East Sheen, came a nice little display of out *Sobralias*, which included *Wigania*, S. *Veitchii aurea*, S. *macrantha*, S. *sanguinea*, and S. *xantholeuca*, with a nice form of *Cypripedium Godefroyae leucocochlidum*.

A small group of *Anotocillia* came from Messrs. W. Bull and Sons, Chelsea, which were well grown and staged with appropriate foliage.

FRUIT AND VEGETABLE COMMITTEE.

Present: George Bunyard, Esq. (chairman), Messrs. J. Cheal, W. Bates, S. Mortimer, Alex. Dean, T. Coomber, C. G. A. Nix, James Smith, F. L. Lane, G. Wythes, J. H. Veitch, A. H. Pearson, H. Balderson, and H. Ealing. The duties of this committee continue to be of a light character.

On this occasion Mr. Thomas Coomber, gardener to Lord Liangstock, The Hendre, Monmouth, staged eighteen Queen Pines in superb condition. They were of good size and splendidly finished. The same exhibitor also staged a good dish of Peaches, named *Raymakers*, the fruits being large and well coloured.

Messrs. Hugh Low and Co., Bush Hill Park, sent a fine fruiting specimen of White Marsellies Fig and two pot Vines, Syrian and Lady Hastings.

Messrs. G. Bunyard and Co., Maidstone, made an interesting exhibit of Strawberries in chip baskets. The fruits were good typical specimens, beautifully packed. The varieties were President, Royal Sovereign, Trollope's Victoria (soft), Sir Joseph Paxton, Louis Gantier, Waterloo, Leader, Monarch, Goliath, Trafalgar, Wallruff (a nice-looking variety), and Dr. Hogg.

From Messrs. Veitch and Son, Exeter, came a good dish of Peas, called Western Express. Specimens of the growth were also staged.

The Horticultural College, Swanley, staged a few seedling Melons and a nice dish of Lady Sudeley Apples.

Mr. George Fowler, 78, Bank Street, Maidstone, exhibited bottling appliances, also a few examples of bottled fruits.

NEW FRUIT.

Melon President Loubet.—A medium-sized fruit, nicely netted, flesh scarlet, and of fair flavour. This was shown by Mr. J. Suell. Award of merit.

HANLEY HORTICULTURAL FETE.

THE seventh annual show was held in Hanley Park on July 1 and 2, and was very successful, one of the best shows ever held there. Mr. Kent, the secretary, deserves congratulations.

PLANTS.

Messrs. Cypher, Cheltenham, were first for the large group; Mr. Vane, Levington, second; and Mr. J. Read, Brethay Hall Gardens, third. Mr. J. Robinson, Altrincham, had the best group of Orchids, and Messrs. Cypher were second. Messrs. Cypher cleared the board for six specimen plants in flower, six flowering and six foliage plants, eight Orchids, and six Palms.

ROSES.

Messrs. Harkness and Co. won first prize in the great class for seventy-two blooms; Mr. George Mount, Canterbury, was second; and Messrs. G. and W. Burch, Peterborough, third.

For forty-eight blooms, distinct: The King's Acre Nursery Company, Hereford, were first; Messrs. Burch were second; and Mr. G. Mount, third.

Messrs. Harkness were first for thirty-six blooms (trebles); second, Messrs. Burch; third, Mr. G. Mount.

Twelve blooms, distinct: First, Messrs. Jarman and Co., Chard; second, Messrs. Townsend and Son; third, Mr. W. H. Frettingham.

Twelve blooms (one variety): First, The King's Acre Nursery Company, Hereford; second, Messrs. Townsend and Sons; third, Mr. G. Mount. Messrs. Townsend were first for garden Roses; The King's Acre Company, second.

Messrs. Harkness were first for a collection of hardy flowers with a brilliant display; second, Messrs. Gibson and Co., Bedale; third, Mr. J. H. White, Worcester.

FRUIT.

Mr. Jordan, Impney Hall Gardens, Droitwich, was first for the decorated dessert table (114 points); second, Mr. Goodacre (110 points); third, Mr. J. Read (89 points).

Twelve dishes of fruit: First, Mr. Jordan; second, Mr. McPherson; third, Mr. Goodacre. Mr. T. Bannerman was first for six dishes of fruit; Mr. J. Read, second; and Mr. Nicholls, third.

Mr. Nicholls was victorious for his bunches of Grapes of both black and white; Mr. J. Read was second; Mr. Goodacre third. Mr. A. H. Hall won for two bunches of black Hamburgh; Mr. Goodacre, second; and Mr. Nicholls, third.

Mr. Bannerman was first for any other black, and also for two bunches of Muscat of Alexandria, as well as for any other white.

GOVERNMENT ENQUIRY INTO FRUIT PESTS.

A DEPUTATION from the National Fruit Growers' Federation and the Herefordshire Association, waited on Lord Onslow recently, for the purpose of calling his lordship's attention to the very serious losses sustained by the industry through the ravages of blight and insect pests, and urging him to grant a Government Enquiry into the whole subject, with a view to concerted action for their eradication. The deputation was introduced by Sir James Rankin, Bart., M.P., and Colonel C. W. Long, M.P. (President of the National Fruit Growers' Federation). Messrs. Radcliffe Cooke, C. D. Wise, W. Horne, A. Grant, H. F. Getting, and J. Riley were all present, and spoke on the subject. Sir James Rankin referred to the Bill introduced by him in the present session, which provided that all nurserymen's stock should be inspected, and that compulsory dressing should be resorted to in their case.

This Bill has been withdrawn, and there appears to be a general feeling among growers that any compulsory measure, if adopted, should be extended to orchards as well as nursery stock. The members of the deputation were, however, agreed that more information was required before legislation is resorted to, and they therefore pressed on the President of the Board the necessity for an official enquiry into the nature of the various orchard pests, and the extent to which they would be preventable, as well as to how compulsory dressing would be regarded by growers. His lordship said, in reply, that he quite recognised the importance of the subject, and was very glad to have heard the views of the deputation, with which he generally agreed, and promised that a Departmental Enquiry should be held, commencing work after the coming recess.

ROSE EXHIBITION AT REGENT'S PARK.

IN the collection of growing and cut Roses which Messrs. William Paul and Son, of Waltham Cross, had on view at the Royal Botanic Gardens, Regent's Park, from June 30 to July 4, we noticed the following excellent introductions of the firm, which are sure to be found in all good collections. First to attract our notice was the beautiful

Chameleam, a flower remarkable for its colouring. As seen here it gave us the impression of being an Anna Olivier with a very heavy brownish red blotch at the base of each petal, and when shown in masses the effect was most telling, as doubtless it will be when planted in beds.

Dainty is another of the very attractive decorative Roses Messrs. William Paul and Son have introduced. Here we have quite a distinct shade of yellow, the prevailing hue being that of the yolk of an egg, but the edging of carmine gives the flower a very dainty appearance.

Elizabeth Killo, too, is a very lovely variety. Any Rose bearing a resemblance to Mme. Abel Chatenay is sure to gain notice. In this case we have the charming colour of the latter, and, to some extent, the Cactus Dahlia-like formation, but the plant is of the even growth of Mme. Jules Grolez. It will certainly prove one of our most useful bedding Roses.

Morning Glow is well named. The glow of the bloom is quite dazzling. A quantity grouped together in the garden would be most conspicuous.

Tennyson was shown in superb form. The splendid finish to the massive, very double flowers makes it an ideal exhibitor's Rose, but it is not only as an exhibitor's Rose that it will be grown. Where a dwarf bedding sort with large flowers is wanted it will be most useful.

Corona we much admired. The warm flush of a most delicate pink shade was delightfully brought out upon the very expansive flowers, some of them being fully 6 inches across, and as flat as a Camellia. This, too, should be a useful bedding Rose.

Badidea is a variety already forging ahead, and we shall not be surprised if it is seen in every prize stand next year. The rich pink colour and grand deep petals are attractive features. We are informed that this, one of Messrs. William Paul and Son's best introductions, is also a fine decorative garden Rose. Many other new Roses, including Corallina, the beautiful Sulphurea, the Alexandria, Salmona, together with older varieties of the firm's introduction, such as Enchantress, Queen Mab, Sylph, Sappho, White Lady, Olo, Spenser, Crown Prince, Pride of Waltham, &c., were well represented, each variety in a basket containing some 30 or 40 blooms, and it appeared to us that this was one of the most natural ways in which Roses could be displayed, in order to give the public a good idea of their true decorative value.

Other good new Roses were also on view, such as the superb Mildred Grant, Frau Karl Druschki, Soleil d'Or, Robert Scott, Dr. F. Guyon, Souvenir de Pierre Notting, and in fact nearly every new Rose of merit was exhibited here during the four days of the special show.

Messrs. William Paul and Son are to be congratulated in bringing together and maintaining such a large collection as was here displayed, the beauty of all being much enhanced by the charming surroundings of these lovely gardens.

CROYDON HORTICULTURAL SHOW.

THE thirty-sixth annual summer show of this society was held on July 8, and an excellent display resulted. The Roses were the best feature.

OPEN ROSE CLASSES.

Messrs. B. R. Cant and Sons, Old Rose Gardens, Colchester, were first in the principal Rose class (forty-eight blooms, distinct), thereby winning the National Rose Society's silver-gilt medal. They showed blooms of most uniform quality. Messrs. D. Prior and Son, Colchester, were second, and Messrs. Frank Cant and Co., Colchester, were third. Most of the blooms in this class were large and good.

Twenty-four Roses, distinct (trebles): Messrs. B. R. Cant and Sons were again first; Frau Karl Druschki was first shown; Messrs. D. Prior and Son, being a good second; Messrs. Paul and Son, Cheshunt, were third.

Mr. Thomas Butcher, The Nurseries, South Norwood, was first in another class for twenty-four blooms, distinct; Mr. Will Taylor, Hampton, second, and Mr. E. J. Jefferys, West Croydon, third.

Messrs. Frank Cant and Co. were first for eighteen (distinct), Mrs. Edward Mawley being a lovely bloom; Messrs. Prior were second, and Messrs. B. R. Cant and Son third.

Messrs. D. Prior and Son, Colchester, were first for twelve blooms of one variety, showing lovely *Bessie Brown*, a splendid lot; Messrs. Frank Cant and Co. were next with Frau Karl Druschki in very good form; third, Messrs. B. R. Cant and Sons, with Her Majesty.

Messrs. Frank Cant and Co. were first for twelve Teas, a variety, with very good and well coloured flowers; Mrs. Mawley; second, Messrs. D. Prior with Maman Cochet, third, Messrs. B. R. Cant and Sons with Medea.

Mr. Will Taylor was first for twelve bunches of gaul Roses. There were no more exhibits in this class.

AMATEURS.

Thirty-six blooms, distinct (challenge cup competition): First, Alfred Tate, Esq., Leatherhead, with a stand that contained some very fine blooms. This exhibit contained in best Rose in the show (Mrs. John Laing, silver-medal); second, Mrs. Hayward, Woodhatch Lodge, Reigate; third, E. M. Crossfield, Esq., Denne Park, Horsham.

Twenty-four Roses, distinct: First, Mrs. Hayward, Marn Cochet being the best; second, E. M. Crossfield, Esq.; third, A. Slaughter, Esq., Steyning.

Eighteen Teas: First, E. M. Crossfield, Esq.; second, Mrs. Hayward; third, A. Slaughter, Esq. These blooms were of moderate quality only.

Six blooms (trebles): First, Mrs. Hayward; the first Marchioness of Londonderry and Maman Cochet were second, A. G. Hammond, Esq., Cambrian House, Rugeley Hill; third, E. M. Crossfield, Esq.

Twelve Roses, one variety: First, Mrs. Hayward, with good Her Majesty; second, Keppel H. Gifford, Esq.; third, E. M. Crossfield, Esq.

Twelve Roses, distinct: First, Edward Mawley, B. Berkhamstead, White Maman Cochet being a lovely bloom; second, F. Wellesley, Esq., Westfield, Woking; third, E. M. Crossfield, Esq.

Twelve Teas, distinct: First, F. Wellesley, Esq., with very good blooms; second, E. M. Crossfield, Esq.; third, A. Slaughter, Esq.

LOCAL ROSE CLASSES.

Twelve Roses, distinct: First (challenge bowl for the year and the National Rose Society's silver-gilt medal), F. A. Amenden, Esq., 22, Chichester Road; second, C. C. W. Esq., Chichester Road.

Six H. P. Roses, distinct: First, C. T. Moon, Esq., Camp Road; second, F. W. Amenden, Esq.

Six Teas, distinct: First, Miss Thrale, Shirley Ex Shirley. This stand contained the best bloom in Edward Mawley in the local classes, which was given a silver medal.

MISCELLANEOUS.

The first prize for table decorations was won by E. Edith M. Robinson, Hilsdale, Purley, with elegantly arranged Pink Carnations and Gypsophila.

Twenty-four bunches Sweet Peas: First, Mr. W. Lind, The Gardens, Marden Park; second, C. B. Crisp, Chichester Road; third, Miss Beckford, Oxford Road, Hants.

Twelve bunches Sweet Peas: First, F. W. Amenden, Esq.; Messrs. J. Laing and Son, Forest Hill, were first for group of plants, showing very well, and winning the silver gilt medal.

For a small group of plants F. A. Radford, Esq., Southhurst, South Hill Park Road was first with a pretty display of the tuberous Begonias were excellent.

The first prize for a group 10 feet by 7 feet was won by F. Link, Esq., J.P., Homedale Park Hill. It contained some splendid Gloxinias.

NON-COMPETITIVE EXHIBITS.

Mr. Butcher, The Nurseries, South Norwood, showed a group of Palms and flowering plants; Messrs. Campbell and Sons exhibited their brilliant Cannas; Messrs. J. Peet and Sons sent Sweet Peas; Messrs. J. Cheal and Son, Cheshunt, showed hardy flowers, and Messrs. John Laing, showed hardy flowers extensively. There were Begonias from Mr. B. R. Cant from Messrs. Paul and Son, Cheshunt, and from Mrs. Jackman, Woking, hardy flowers and Water Lilies from Mrs. Amos Perry, and hardy flowers from Messrs. T. & G. Limited.

Strawberries and Tomatoes were the chief features in the fruit and vegetable classes, while the tent devoted to the cottagers' exhibits was of much interest and contained excellent produce.

WOLVERHAMPTON FLORAL FETE.

ONE of those circumstances over which one has no control occurred at the Wolverhampton Floral Fete on the evening of Monday, the 8th inst., when the wind rose and forced the authorities to lower all the tents. Happily, in the order to the big marquees, wherein nearly all the main poles were broken, no one was injured; but it was impossible to do anything in regard to staying to be done overnight. In the opening day of the exhibition the tents were rapidly put up and by nine o'clock all were standing, though no sleep was then erected. However, exhibitors and committees worked with such unanimity that the judging of the show was commenced at 11.45 a.m., only an hour and a quarter after the proper time. It was in the non-competitive specimen plant, and group sections that the greatest and most occurred, and when our representative left late in the afternoon the groups for which Wolverhampton has become

famous were not arranged, and we are forced to omit any further reference to them in this report. While condoling with the managers upon the trouble which has come upon them, we must congratulate them upon the manner in which it was met and largely overcome. There was no hurry or excitement, the work being pushed forward with steady persistency. As has been said, the Rose section was ready for the Judges at 11.45 a.m., and the display was one of the finest that has been seen this year. There were many hundreds of blooms staged by amateur and professional growers, and throughout there was an evenness of quality. In the amateurs' division the chief honours fell to the Rev. J. H. Pemberton, and in the nurserymen's section to Messrs. E. Harkness and Co.

AMATEURS.

The chief class in this division was for thirty-six single trusses, distinct, and the place of honour was secured by the Rev. J. H. Pemberton, Havering-atte-Bower, Romford, whose beautiful exhibit comprised Mrs. E. G. Sharman Crawford, Ulrich Brunner, Marchioness of Londonderry, Horace Vernet, Mrs. J. Laing, Countess of Caledon, Caroline Testout, Françoise Michelson, and Papa Lambert. Mr. R. Foley Hobbs, Worcester, was placed second, and had charming blooms of Tom Wood, Mrs. John Laing, White Maman Cochet, Kaiserin Augusta Victoria, Caroline Testout, Bessie Brown, and Frau Karl Druschki amongst others. Mr. W. Boyes, Derby, was third.

For six blooms (trebles) the Rev. J. H. Pemberton won with Bessie Brown, Charles Lefebvre, Mrs. J. Laing, A. K. Williams, Kaiserin Augusta Victoria, and Caroline Testout. Mr. M. Whittle, Leicester, who was second, had Mrs. E. Mawley in grand condition. Mr. F. Dennison, Kenilworth, was third.

The Rev. J. H. Pemberton was again first for twenty-four distinct. Messrs. R. Foley Hobbs and M. Whittle were second and third.

For twelve, distinct, the prize-winners were Messrs. M. Whittle, F. Dennison, and the Rev. J. H. Pemberton, in the order in which their names are given.

For twelve Teas, distinct, Miss Whittle was easily first with Bridemaid, Medea, White Maman Cochet, The Queen, Mrs. E. Mawley, Princess of Wales, Mme. Cusin, Comtesse de Nadailac, and Caroline Kuster. Mr. R. Foley Hobbs was second, and Mrs. F. A. George, Worcester, third.

NURSERYMEN.

The great class of the show was that for seventy-two, distinct, and there were no less than six competitors, of whom the Metropolitan champions, Messrs. E. Harkness and Co., were placed first with a magnificent stand of fresh bright blooms. Some of the varieties best represented were Ulrich Brunner, White Lady, Charles Lamb, Papa Lambert, Marie Baumann, Mrs. J. Laing, Gustave Piganeau, Heinrich Schultze, Marchioness of Dufferin, E. Y. Teas, Muriel Grahame, Horace Vernet, Mrs. Harkness, Alfred Cuthbert, Captain Christy, Marie Verdier, Dr. Sewell, Mrs. W. J. Grant, Comtesse de Ludre, Marchal Niel, J. S. Mill, Innocente Pirola, and Mme. E. Verdier. Messrs. B. R. Cant and Sons, Colchester, were second, some of their best blooms being A. K. Williams, Mildred Grant, Mme. Cusin, Comtesse de Nadailac, Catherine Mermet, Ben Cant, and Souvenir d'Elise Vardon; Messrs. D. Prior and Sons third.

In the class for forty-eight, distinct, Messrs. E. Harkness and Co. were again ahead. Mildred Grant, Ulrich Brunner, Papa Lambert, Star of Waltham, Her Majesty, E. Y. Teas, Bessie Brown, Suzanne Marie Rodocanachi, Mme. Delville, and Frau Karl Druschki were very fine. Mr. G. Mount was second, and Messrs. B. R. Cant and Sons third.

Mr. G. Mount secured the lead for eight trebles with grand examples of Mrs. W. J. Grant, Mildred Grant, Ulrich Brunner, Frau Karl Druschki, Marchioness of Londonderry, Mrs. J. Laing, Bessie Brown, and Caroline Testout. Mr. G. Mount also won for twelve bunches of Roses, some of the best being Captain Hayward, Liberty, Mrs. W. J. Grant, General Jacquemont, and Ulrich Brunner. Mr. G. Prince was second, and the King's Acre Nurserymen, Hereford, third.

In the class for twelve new Roses, Messrs. B. R. Cant and Sons were first with a handsome set; Messrs. A. Dickson and Sons, Newtownards, and Messrs. Perkins and Sons, Coventry, were second and third.

For twelve dark Roses, one variety, Mr. G. Mount was first with Liberty in wonderful colour; Messrs. D. Prior and Sons second with A. K. Williams, and the King's Acre Nurserymen third with the same variety. For a light Rose Mr. G. Prince was first with superb specimens of Mildred Grant; Messrs. Townsend and Son second, and Messrs. D. Prior and Sons third.

In the class for twenty-four, distinct, Mr. G. Mount was first with Ulrich Brunner, Mildred Grant, Lady Moyra sauciere, Frau Karl Druschki, Mrs. J. Laing, Suzanne Marie Rodocanachi, Marquise Litta, and others. Messrs. J. Townsend and Son were second, and Mr. G. Prince third, the last-named showing very strongly in both classes for six and Noisettes.

Sweet Peas, herbaceous flowers, Pansies, and Violas were all grandly staged, while specimen plants and Begonias made splendid show in themselves. Fruits and vegetables were not creditable, some of our best growers showing in both cases. The non-competitive section was magnificent, and comprised practically everything that could be shown. Messrs. Webb and Sons write that they were awarded a large gold medal for their exhibit of Gloxinias, &c.

MANCHESTER ROSE SHOW.

ITS annual fixture fully sustained its high reputation on July 11 as one of the finest gatherings of the season. The rooms were considered to be quite equal to anything staged during the year. The competition also proved keen, in some cases ten entries being staged. The day proved an ideal one, warm, but unless the Roses were therefore attractive till closing time.

OPEN CLASSES.

Sixty distinct single trusses brought six competitors, Messrs. Harkness and Co. staging the premier lot. They had fair-

sized fresh blooms, the best being Comte de Raimband, Her Majesty, La France de 80, Gustave Piganeau, Frau Karl Druschki, Earl of Dufferin, Gladys Harkness, Mildred Grant, A. K. Williams, Bessie Brown, Comte de Ludre, Maman Cochet, Mrs. John Laing, Golden Gate, and others; second, Messrs. Alex. Dickson and Sons, Limited, Newtownards, with some fine blooms of Mildred Grant, Charles Lefebvre, Duke of Wellington, A. K. Williams, and others; third, Messrs. Frank Cant and Co., Colchester.

For thirty-six distinct trusses: Messrs. Harkness were again first, with a very fine stand; second, Messrs. Prior and Sons, Colchester; third, Messrs. A. Dickson and Sons. There were several more competitors.

Twenty-four Teas or Noisettes: Messrs. Frank Cant and Co., Colchester, won with a fine lot, the best being Maman Cochet, Mme. de Watteville, Muriel Grahame, Etiole de Lyon, and others; second, Mr. George Prince, Longworth, with fine blooms of Mrs. E. Mawley, White Maman Cochet, Maman Cochet, Hon. Edith Gifford, and Mme. Cusin. Messrs. Prior and Sons won the remaining award.

Twelve Teas or Noisettes: Mr. G. Prince led with a fine even box of varieties, already named. Messrs. Frank Cant and Co. and Messrs. Prior and Sons were placed in the order named.

Twelve trusses of any white or yellow Rose: Mr. G. Prince secured the chief honour with very fine White Maman Cochet. Messrs. Harkness were second with Frau Karl Druschki; third, Messrs. Prior with White Maman Cochet.

Twelve single trusses any light colour: Messrs. A. Dickson and Sons won with grand blooms of Mildred Grant; Messrs. J. Townsend and Sons, Worcester, were second with Bessie Brown; Messrs. Frank Cant and Co. third with Mildred Grant.

Twelve single trusses of any crimson: The King's Acre Nursery Co., Hereford, secured the leading award with massive blooms of A. K. Williams; Mr. Hugh Dickson, Belfast, was second with well-formed blooms of Hugh Dickson; the remaining award went to Messrs. Prior and Son for A. K. Williams.

AMATEURS.

Twenty-four trusses, distinct: E. B. Lindsell, Esq., took the lead with a fine lot. Especially good were Ulrich Brunner, Bessie Brown, Horace Vernet, A. K. Williams, Victor Hugo, Maman Cochet, Charles Lefebvre, and Duchess of Portland; second, the Rev. J. H. Pemberton; Conway Jones, Esq., was third.

Twelve distinct varieties: First, E. B. Lindsell, Esq., with large blooms; R. Foley Hobbs, Esq., and the Rev. J. H. Pemberton second and third.

Eighteen Teas or Noisettes, distinct: Conway Jones, Esq., led with fair sized pretty blooms. R. Foley Hobbs, Esq., and Richard Park, Esq., were placed as named.

Twelve Teas or Noisettes brought five competitors, the prize takers being Messrs. R. Park, Conway Jones, and E. B. Lindsell.

Twelve single trusses of any white or yellow: First, the Rev. J. H. Pemberton, with Bessie Brown in good form. F. R. Curtis, Esq., was second; H. V. Machin, Esq., third.

Twelve blooms of any light coloured variety: R. Park, Esq., was first with Bessie Brown; E. B. Lindsell, Esq., second, with large blooms of Her Majesty, and R. Foley Hobbs, Esq., third, with Bessie Brown.

Twelve blooms of any crimson: First, the Rev. J. H. Pemberton with Charles Lefebvre. H. V. Machin, Esq., with Gustave Piganeau and F. R. Curtis, Esq., with Ulrich Brunner were second and third.

For district grown Roses, twelve varieties, C. Burgess, Esq., was first, and R. Hall, Esq. second; the first and second prize winners for six being the same exhibitors.

MISCELLANEOUS.

For a display of Roses, Mr. J. Matlock was placed first. His exhibit comprised some lovely single varieties; Messrs. J. Townsend were second with a somewhat formal display; Mr. G. Prince third, having grand blooms of Liberty, Mme. J. Grolex, and others.

For the best arranged basket of Roses, Messrs. Perkins and Sons, Coventry, won; Mrs. J. Nixon and Miss Ada Stanley took the remaining prizes.

The society's silver medal was awarded to Messrs. Alex. Dickson and Sons, Newtownards, for Mildred Grant as the best H.P. or H.T., and Mr. G. Prince had a similar award for White Maman Cochet as the best Tea or Noisette.

For the best collection of Sweet Peas, Mr. John Derbyshire secured the silver medal for a meritorious lot of about 100 varieties. In the class for twelve varieties the same exhibitor was first, a new variety called Dainty having a white ground with a rosy pink edge, was included. For not less than twenty-five varieties, Mr. F. Smith secured the chief honour.

Of non-competitive exhibits, Messrs. Jones and Sons, Shrewsbury, were awarded the silver-gilt medal for a fine collection of Sweet Peas.

Certificates of merit were awarded to Mr. W. L. Pattison for Violas; Messrs. Caldwell and Sons for Roses and herbaceous cut flowers; Mr. J. W. Williamson for a very fine specimen of Lilium auratum; and to Mr. J. Pilling for Violas.

At the luncheon several members of the District Council were present, and in replying to the toast of the visitors, an announcement was made that it was desired by the council that the gardens should remain for all time in their present form. Mr. P. Weathers, as usual, made most satisfactory arrangements both for the exhibitors and the numerous company of visitors who patronised the exhibition.

EAST ANGLIAN HORTICULTURAL CLUB.

THERE was a large gathering of East Anglians at the July meeting to hear a discourse by Mr. G. Davison, of Westwick House Gardens, upon "Herbaceous Flowers." Mr. Davison has a wide repute for growing these flowers well by the fact of his having taken for several years in succession first prize for forty-eight bunches at the Norfolk Society's Show. The

way he talked of the plants and their habitats at once showed his love and deep interest for them. He said that to talk of a herbaceous garden was to talk of a garden of flowers, a garden where, from the Aconite to the Helioleba, something fresh was to be found daily. He told also what success was to be obtained by learning the natural habitats of plants and making the position in the garden as like them as possible. Make groups of this class of flowers bold and imposing. Be careful to use only the best portions of the plants for replanting. Mr. Davison also made allusion to the beauty of the flowering shrubs. He also told of the wayside flowers and the possibilities of working these up to good. The following were some of the specimens Mr. Davison had filed the table of the room with and to which he occasionally made reference: Lilium giganteum, Lathyrus latifolius grandiflorus albus, new seedling Delphiniums of many shades and massive spikes, Orchis foliosa, Paeonies, Tropaeolum, Eremurus Bungei, Enothera speciosa roses, and a good many others.

A hearty vote of thanks was accorded Mr. Davison for his instructive discourse. A capital discussion followed in which Messrs. T. B. Field, E. Peake, J. C. Abel, the president, and others took part. The exhibition tables were well filled with good produce, in the competitive classes Roses and Peas (edible) being exceptionally good.

Six Tea Roses, staged by Mr. F. Williams, gardener to Mr. Louis Tillett were the best in that class. Mr. C. Matthews, gardener to L. S. Willett, Esq., Thorpe, being first for six H.P.'s.

An award of merit was given by the floral committee to a grand salmon zonal Pelargonium seedling raised by Mr. D. Howlett, gardener to T. Chaplin, Esq., Thorpe Hamlet. Mr. Henry Dobbie, Pinebanks Gardens, Thorpe St. Andrew, secured Mr. E. Peake's prize for six specimens of wild flowers correctly named.

Mr. Robert Holmes, Tuckwood Farm, Norwich, showed a decided new break in the Shirley Poppies with full double and semi-doubles of pretty shades which are coming true from seed. The Shasta Daisy, too, is well grown by Mr. Holmes, and he staged half a score bunches, quite distinct in form, some being 4 inches across. Mr. C. H. Fox, gardener to Sir Edward Mansel, Bart., Catton House, had a bunch of exceptionally good seedling Delphiniums, very large in the individual blossoms and bold spikes.

The competition for the cup presented by Mr. E. T. Boardman, Town Close, Norwich, was commenced, Mr. C. H. Hines, Trowse, gaining the most points. The second stage of the cup presented by Mrs. Louis Tillett, Old Catton, was also decided, the vegetables being so good as to cause a tie between Mr. C. H. Hines, Trowse, and Mr. W. Eash, Thorpe. It should be mentioned, also, that Mr. G. Davison had brought up large patches of the Bog Pimpernel and Monotropa hypophysis, the latter a most curious root parasite.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.

THE conversation and exhibition of this association took place on Tuesday, the 7th inst., and was quite equal to, if not distinctly in advance of, many of its predecessors. Two large halls were needed to display the garden produce of its members, and the exhibits in many instances were of a high order of merit.

The table decorations of the ladies were a very special feature, and on this occasion several handsome prizes were given by generous donors. The chief class was won by Mrs. G. W. Cook, Muswell Hill, N., who had a very dainty arrangement of Cecile Brunner Rose and appropriate foliage; Mrs. Oliver, Tollington Park, N., was second with a superb arrangement of Iceland Poppies and Asparagus; and Miss Wright, Nigel Road, Peckham, S.E., was placed third. In another class for prizes of less value, Miss Wright was first with an arrangement of red Poppies and Oaks, and Mrs. Cook second with pretty decorative Roses. In another class of a similar character Mrs. A. Taylor, East Finchley, N., was first with Iceland Poppies, &c., and Miss Welch second with pale pink Carnations. Miss Oliver was first with a large vase of flowers, set up for artistic effect, and Miss Grose second. Miss Welch led in the class for a vase of Sweet Peas, and Mrs. Taylor was second.

The Sweet Pea championship for the trophy offered by Mr. R. Sydenham, Birmingham, was won by Mr. D. B. Crane, Highgate, N., who had large blooms of good colour of most of the newer and better sorts set up in pleasing fashion. In this case the patent vases for displaying Sweet Peas were used by the winner, and much may be said in their favour. For the "Needs" Sweet Pea championship several of the exhibitors were disqualified, and in this instance Mr. Oliver, Tollington Park, N., was second. Of the "Ichemic" championship for cut flowers, set up on space 5 feet by 2 feet, Mr. D. B. Crane was a good winner, staging a most representative collection of hardy flowers in season, and tastefully displayed.

Mr. G. W. Cook, Muswell Hill, N., easily secured the silver medal for six bunches of garden Roses. These were beautifully staged, and the flowers were of a high order of merit.

Mr. T. W. Sanders, F.L.S. (the president) took the chair at the conversation and concert, and it was quite late before the company dispersed after the close of a most enjoyable time.

FRENCH HORTICULTURAL SOCIETY OF LONDON.

ON Saturday last the members of the above society were invited by Mr. Peter Kay, the eminent Grape culturist of Finchley, to visit his establishment there. The party, consisting altogether of about fifty persons of various nationalities, English and French predominating, assembled on the ground about 4 p.m. They were met by Mr. Thomas Bevan, who conducted the party through the various greenhouses, and who gave information as to the extent of Mr. Kay's culture, the method by which the whole establishment was supplied with water, independent entirely of the local water company, and much other technical matter. Among the visitors were Mr. George Schneider, Mr. Ingamells, Mr.

Witty, Mr. Harman Payne and Son, Mr. Cutbush and Son, Mr. Drost, Mr. Guillod, Mr. R. H. Pearson, Mr. Michle, and many of the young French members.

The inspection of the establishment being ended, the company was then conducted to the lawn behind Mr. Kay's residence, where tables were spread and a light meal provided. Here the visitors remained for some time, enjoying the open air entertainment in the heartiest good humour, frequent references being made to the recent demonstrations of friendly regard that have taken place between the two nations, which, as one speaker pointed out, are no new thing between English and French horticulturists, who have always held each other in high esteem.

Mrs. Kay, upon the invitation of her husband, proceeded in fluent and excellent French to propose the health of M. Loubet, which was cordially received. Mr. G. Schneider proposed the health of the King and other members of the Royal family, both of these toasts being duly honoured by the singing of the respective national anthems.

The chairman, Mr. Peter Kay, expressed his delight at seeing so many friends of the society present, reminding them that he had been awarded gold medals in France for his Grapes, and was also elected a member of the National Horticultural Society of France. He proposed the toast of success to the French Horticultural Society of London, and would ask its president, Mr. Schneider, to reply. Mr. Schneider, in returning thanks, dwelt briefly on the aim and objects of the society, expressing gratitude for their reception by Mr. and Mrs. Kay that afternoon, and to all friends who had helped in the work of their society, which now numbered 600 members. Other toasts were responded to by Mr. Thomas Bevan, Mr. Harman Payne, Mr. Hunt, a visitor from New Zealand, and others. Altogether the meeting was a very cordial and enjoyable one. The weather was perfect, and Mr. and Mrs. Peter Kay's hospitality was much appreciated, and will long be remembered by every one present.

ROMFORD AND ESSEX HORTICULTURAL SOCIETY.

THE fifty-fifth annual exhibition of this society was held in a meadow overlooking Gilden Hall Park, Romford, on Thursday, July 9. To protect their position financially, the executive had deleted from their schedule of prizes several large and important classes, but, notwithstanding the display was of a most interesting description. In some instances, however, the competition left something to be desired, but this may rightly be attributed to the vagaries of the weather this season.

PLANTS.

For the best and most tastefully arranged group, with a circular front, 10 feet by 6 feet, Mr. A. C. Philbrick, gardener to Mrs. Mashier, Marshall's Park, Romford, had the best exhibit. The arrangement was pretty and pleasing and the plants were well disposed. Mr. H. C. Chaffe, gardener to H. B. Michell, Esq., Eastbury House, was a good second, although some of the more important points of the group were not well finished.

The five guinea challenge cup presented by the late president was won outright on this season by Mr. W. Richardson, gardener to F. Green, Esq., Hainault Lodge, for a similar group to the last mentioned, but in this instance 6 feet by 5 feet. This group was well arranged with bright flowering and good quality foliage plants. Second prize was awarded to Mr. A. Higgins, Cottage Homes, Hornchurch.

A decorated fireplace was an interesting class, by far the best display, winning first prize for Mr. Richardson, who had Hydrangeas, Acalypha Sanderii, Begonias, and a pleasing assortment of foliage plants charmingly disposed; Mr. Higgins was second, and Mr. Philbrick a good third.

CUT FLOWERS.

Five entries for twenty-four cut Roses, distinct, made a brave display, a good lot securing first prize for Mr. G. H. Baxter, Hutton Park, Brentwood; Miss Pemberton, Havering, was second with a good lot of blooms; Mr. P. Perry, White Horse, South Weald, was third.

Mr. G. H. Baxter was the only exhibitor of twelve Tea Roses, distinct, and was awarded first prize.

The three exhibits in the class for twelve bunches of Sweet Peas made a charming display, Mr. Baxter again leading; Mr. Higgins was placed second with blooms less meritorious.

Twelve bunches of cut flowers found Mr. Richardson again leading with a fair lot of flowers of a varied character; and Mr. Chaffe was second.

FRUIT.

For the season fruit was well shown. For a collection of four distinct varieties, Mr. R. Farrance, Chadwell Heath, staged a very handsome lot, Gros Mission Peach, black Hamburg Grapes, Steel's Victoria Raspberries (very good), and Latest of All Strawberries placed this exhibitor in the leading position; Mr. W. Green, Harold Wood, was placed second.

Mr. Farrance led in the class for three bunches black Grapes, and Mr. Chaffe was placed second. With a dish of crimson Galande Peach, Mr. Farrance and Mr. Green with a good and ripe Melon, secured first prize in their respective classes. In the class for three dishes of Strawberries, distinct, Mr. W. Green staged a phenomenal trio. They were indeed fine, Royal Sovereign, Dr. Hogg, and Latest of All being seen at their best.

For a single dish of Strawberries Mr. Farrance led with a grand basket of Latest of All. Mr. Green being second with Dr. Hogg, and Mr. Richardson was third. Mr. Farrance won first prize for a dish of Gooseberries, showing Leveller; Mr. A. C. Philbrick being second; and Mr. Chaffe third. The last-named led with a nice and well-finished dish of Tomatoes; Mr. Farrance second, and Mr. Higgins third.

Vegetables were fairly well staged, particularly so in the amateurs' and cottagers' tent. The display as a whole was very encouraging to the executive, and with such a long experience it is hoped this society will have a useful future.

Table decorations were beautifully arranged by Mrs. W. Green, Harold Wood, who also was placed first in the

classes for a bouquet and button-holes. Mr. Leonard Brown, Brentwood, had a small though very charming exhibit of Sweet Peas in fine condition, and an interesting collection of English Irises set up with considerable taste.

ULVERSTON ROSE SHOW.

ON Thursday, the 9th inst., delightful weather favoured this popular event, which has now become one of the most important shows in the North of England, and that chiefly owing to the labours of the committee and Messrs. G. Mackereth and G. W. Poole, the honorary secretaries. The gate money amounted to over £130. From the many shows held last week one might naturally expect a decrease in the open classes, but this was more than compensated for by the wondrous display from Messrs. A. Dickson and Sons, Newtownards, County Down and Ledbury, who swept all before them, many new seedlings figuring prominently.

OPEN CLASSES.

The great class in the show was for seventy-two distinct, Messrs. A. Dickson and Sons staging flowers of grand substance and colour, some of the best blooms of which were Alice Lindell, Bessie Brown, Mrs. Conway Jones (a charming pink), Frau Karl Druschki, and Mrs. D. McKee (a bright yellow H.T.). They also had the first prize for sixteen trebles, a most superior lot.

Also in the class for thirty-six, distinct, was the same good quality shown. Marchioness of Downshire, Caroline Teatout, Duchess of Westminster (a superb pink), and several seedlings telling with good effect. Mr. H. V. Machin, Worsop, staged a smaller but effective stand, Bessie Brown, Victor Hugo, and Captain Hayward stood out conspicuously.

For six blooms each of dark, light, and Teas, Messrs. Dickson were again first. Frau Karl Druschki, Lady Derby, Mrs. W. J. Grant, Niphetos, and Rubens were splendid. Mr. H. V. Machin was a moderate second.

The class for twelve Teas or Noisettes was again a victory for Messrs. Dickson. The same firm won the National Rose Society's bronze medal for the best H.P., the best Rose, the best H.T., and the best Tea or Noisette, with Horace Vernet, Mildred Grant (2), and Bessie Brown, in each case being followed by Mr. Machin, who showed very well.

Messrs. Dickson's stand for twelve new Roses was greatly admired, and contained the following varieties: Gladys Harkness, Countess of Annesley (the best new seedling), Alice Grahame, Frau Karl Druschki, Mrs. D. McKee, Duchess of Portland, Lady Derby, Robert Scott, Mildred Grant, and a sterling seedling. They had the finest twelve blooms of one dark and one light variety in Tom Wood and Mrs. E. Mawley; Mr. Machin again following.

AMATEURS.

Classes were numerous, but space will only allow of the following being dealt with, viz., the gold challenge cup class, value 15 guineas and medal. Here Mr. F. W. Tattersall of Morecambe won for the second time with some good blooms. Mr. R. L. Garnett, Lancaster, was a close second, and the Rev. R. T. Langtree, Grange, third. The latter exhibitor had a beautiful lot in eighteen distinct. The prizes in the remaining classes were evenly distributed among Messrs. Machin, Midgley, Tattersall, and Garnett.

The medal for the best dark Rose went to Mr. Machin for Gustave Piganeau; for the best Tea to Mr. H. E. Johnson for Innocente Pirola, and for the best H.T. to Mr. Garnett for Mildred Grant.

GROWERS OF LESS THAN 300 PLANTS.

The Ulverston Council trophy and silver medal was won by Mr. F. J. Harrison, Ulverston, Messrs. Postlethwaite and H. E. Johnson taking many others. The Myles Woodburne challenge trophy, for the best bloom, was awarded to the latter gentleman with a fine Innocente Pirola.

SWEET PEAS.

These were magnificent. The J. Towers Settle challenge trophy, value 20 guineas, also the first prize in the class for twelve, were handsomely won by Mr. M. Firth, Leicester. A 10 guinea cup for local growers, given by the same gentleman, was taken by Dr. Jackson. The Irish-grown flowers from Messrs. Alex. Dickson were noticeable for their grand colour. Messrs. Garnett and Midgley also showed well.

Certificates of merit were given to Messrs. Jones and Sons, Shrewsbury; Mr. R. Bolton, Carnforth, for Sweet Peas; Mr. Mawson, Windermere, for herbaceous plants; and Mr. Mackereth, for shower bouquets.

WOODBIDGE FLOWER SHOW.

So strong a hold has Woodbridge Show secured in East Anglia generally that it has been for long, and is so still, a name to conjure with. A casual visitor seeing this show for the first time has not far to go on entering the town before he sees signs of and feels the influence which has secured for this show the success it boasts of, as being the chief, the oldest, and the most popular show and gala in East Anglia. The enthusiasm engendered by the show is apparent everywhere. It is in the atmosphere; everybody is smitten with it. We never saw a country town so bedecked with flags and banners and bunting before. Every house, like its occupant, was made to wear a smiling face, for that day at least. All associated with the show, now established fifty-two years, are deserving of the highest praise, from the president (Lord Rendlesham), Major and Mrs. Howey, in whose beautifully wooded park it was held, the committee, and last but not least, the hon. secretary, Mr. John Andrews, who for so many years has been tireless in his efforts to minister to the success of the show, and to whom the exhibitors and judges are especially indebted for boundless hospitality at his private residence.

The show was held in six tents on the 9th inst. Apart from the Rose tent the chief attractions of the show were centred in the large tent, and the exhibits in it were chiefly honorary and supplied by the trade. The following firms

were well represented by splendid exhibits of plants and flowers. Messrs. Wallace of Colchester, amongst other good things, had a splendid collection of Iris Kempferii.

Messrs. Daniel Brothers of Norwich had an extensive collection of hardy herbaceous flowers artistically arranged under the supervision of one of their managers, Mr. Clayton. Conspicuous amongst them was a grand new variety of Candytuft Grand Emperor, and Carnation Victoria Harbord, as well as a large collection of the best Sweet Peas. Messrs. Fred Smith and Co., seed growers of Woodbridge, had an imposing bank of hardy flowers in season. Mr. R. C. Notcutt, of Ipswich and Woodbridge, had a unique and beautiful exhibit of Roses arranged in glasses with abundant foliage and on long shoots, affording an effective object-lesson in the natural and best way of arranging the Rose. Messrs. King and Co., of Coggeshall, exhibited Sweet Peas in great variety and excellence. Messrs. Cutbush and Sons, of Highgate and Barnet, were represented by an interesting exhibit of flowering plants and cut flowers. From the president, Lord Rendlesham, came a beautiful collection of Carnations.

Among the cut flowers at this season of the year the Rose always takes precedence, and here it had a largesse devoted to itself, and for quality of flowers and extent of exhibits it was one of the best of the year so far.

Fruit was well represented. The Grapes throughout showing good quality, as did other fruits also. We have not seen British Queen Strawberry so well exhibited for many years. It was the true variety, the flavour being quite distinct and very delicious. Plants in pots were the weakest feature of the exhibition, very few possessing any merits being shown. Vegetables, on the contrary, both in the open and the cottagers' classes, were well shown and in good numbers. We congratulate the society on the success of the show, and especially on the record attendance and cash taken at the gate.

Thirty-six distinct varieties, single trusses: First, Messrs. R. Harkness and Co., Hitchin; second, Messrs. Prior and Son, Colchester; third, Messrs. B. R. Cant and Sons, Colchester.

Twenty-four blooms: First, Messrs. Prior and Son; second, Messrs. B. R. Cant and Sons; third, Messrs. R. Harkness and Co.

Twelve blooms, Teas or Noisettes: First, Messrs. F. Cant and Co., Colchester; second, Messrs. Prior and Son; third, Messrs. B. R. Cant and Sons.

Twenty-four distinct garden or decorative Roses, space 10 feet by 8 feet: First, Messrs. F. Cant and Co.; second, Messrs. B. R. Cant and Sons.

AMATEURS.

Twenty-four single trusses, twelve Teas or Noisettes allowed: First, Mr. O. G. Orpen, West Bergholt; second, Rev. A. Foster-Melliar, Sproughton; third, Mr. F. Curtis, West Bergholt.

Twelve single trusses: First, Mr. O. G. Orpen; second, Rev. A. Foster-Melliar; third, Mr. Reginald Steward, Packingham Hall, Norwich.

Six single trusses (Teas or Noisettes): First, Rev. A. Foster-Melliar; second, Mr. O. G. Orpen; third, Mr. R. Steward.

Six any Teas or Noisettes, single trusses: First, Mr. O. G. Orpen; second, Mr. F. Curtis; third, Mr. R. Steward.

Six Briar Roses (distinct varieties): No entry.

There were many classes provided for miscellaneous cut flowers arranged for effect, and these undoubtedly formed one of the best features of the show.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE usual monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. Thomas Winter presided. Four new members were elected, making sixty-one this year, the total membership now being 1,026. Five members were reported on the sick list. The sick list has been unusually heavy during the last half year.

NATIONAL SWEET PEA SOCIETY.

THE third exhibition of this society was held in the Prince's Hall, Earl's Court, on Wednesday and Thursday last. The quality of the blooms, on the whole, was excellent, but it is a pity that the surroundings were not more attractive. The yellow-painted sides of the building would have been much improved by a partial draping, and the exhibits, as a whole, were very flat. These are, however, minor points, to which the committee are fully alive. The exhibition was a very pretty one, and Mr. Horace J. Wright (the hon. secretary) has worked hard for its success.

OPEN CLASSES.

Special classification class. Collection of nineteen varieties. This class is intended to illustrate the colour distinctions in the society's classification. First prize, Mr. C. W. Breadmore, 120, High Street, Winchester, with a really distinct collection. Duke of Westminster (purple), Hon. Mrs. E. Kenyon (very pale yellow), Coccinea (red), Jeannie Gordon (cream and rose), and Lady Grief Hamilton (lavender) were the most striking; second, Mark Firth, Esq., Wistow Hall, Leicester (gardener, Mr. F. J. Clark), America (splashed red and white), Lottie Eckford (pale blue-violet), Dorothy Tennant (rich purple), Mars (crimson), Captain of the Blues (rich blue-purple) were excellent; in fact, the colours were remarkably good. A. G. Haymah, Esq. (gardener, Mr. Ackland), Hapfold House, Froume, was third, with good flowers also.

Thirty-six bunches: First, Mr. Mark Firth, Wistow Hall, Leicester (gardener, Mr. J. Clark), with bright distinct flowers. Mr. Leonard Brown, Dafodil Nursery, Brentwood, was second; and Mr. Breadmore, Winchester, third. The first prize lot was arranged by far the best.

Twelve bunches: First, Messrs. Jones and Sons, Shrewsbury, with excellent flowers; second, Mr. Breadmore, Winchester, with crowded vases; third, Messrs. E. W. King and Co., Coggeshall.

CARSON'S PLASTINE.

A PLASTIC, DURABLE, GLAZING COMPOSITION.

Withstands exposure to heat and moisture on Forcing Houses, Conservatories, Frames, etc. Supersedes Genuine Linseed Oil Putty.
SOLD IN KEGS, 28lbs., 56lbs., and 112lbs. each. Price 16s. per cwt. 2 cwt. and upwards delivered carriage paid.

"VITROLITE."

A PAINT SPECIALLY PREPARED FOR HORTICULTURAL WORK.

Durable, Elastic, will not Flake or Scale, Dries with an Enamel Surface.

WHITE, AND STONE COLOUR, 7s. 6d. per gallon. Mixed ready for use. 8 gallons and upwards delivered free.

FULL PARTICULARS SENT ON APPLICATION.

TRADE EXCLUDED.

Thirty-six bunches: First, Mr. A. G. Hayman (gardener, Mr. Ackland), Hapfold House, Frome, with a really excellent display; a good second Mr. G. H. Baxter, Hutton Park, Brentwood (gardener, Mr. H. Holloway); third, Mr. Michels, Kingston.

Twenty-four bunches: First, Mr. A. F. Wootton, College Road, Epsom, with fresh and bright blooms; second, Mr. H. T. Michels, Farleigh House, Kingston (gardener, Mr. Hughes); third, Mr. R. Bathurst, Iron Acton, Gloucester.

Twelve bunches, distinct: First, Mr. Hugh Aldersey, Aldersey Hall, Chester, the new King Edward VII. being the best; Mr. T. Lloyd Davies, Park House, Addlestone (gardener, Mr. George Crabbe) was a good second, Agnes Johnson (rose-buff) being a lovely flower; Mr. H. J. Meyer, The Grange, Harlow, was third; and Mr. Mark Firth fourth. There were eleven exhibits in this class.

Nine bunches: First, Mr. Hugh Aldersey, Aldersey Hall, Chester, with pretty, well set up flowers; second, Mr. A. Stear, Royaton Park, Pinner; third, Miss Beekford, Ham Common (gardener, Mr. J. Watson).

Six bunches: First, Mrs. F. Brewer, Suffield House, Richmond, with Gorgeous and Lottie Hutchins as the best of a pretty lot; second, Mr. S. F. Jackson, Danehurst, Epsom; third, Miss Beekford.

OPEN.

Two bunches (white): First, Mr. C. W. Breadmore, Winchester, with excellent Sadie Burpee and Dorothy Eckford; second, Mr. Hugh Aldersey; third, Mr. R. Bathurst, Dean Lodge, Iron Acton, Gloucester.

Two bunches (crimson): First, Mr. Breadmore with Salopian and Mars; second, Miss Beekford, Ham Common (gardener, Mr. J. Watson); third, Mrs. F. Brewer, Suffield House, Richmond.

Two bunches (yellow): First, Mr. Breadmore, with Hon. Mrs. Kenyon and Hon. Mary Ormsby Gore; second, Mr. Hugh Aldersey; third, Mrs. F. Brewer, Richmond.

Two bunches (pink): First, Mrs. F. Brewer, Suffield House, Richmond, with Lovely and Prima Donna; second, Mr. J. Lloyd Davies, Addlestone; third, Mr. M. Y. Green, Eynaford.

Two bunches (rose and carmine): First, Mr. Breadmore, with Lord Rosebery and Prince of Wales; second, Mr. R. Bathurst; third, Mrs. F. Brewer.

Two bunches (mauve): First, Mrs. F. Brewer, Admiration and Dorothy Tennant were the varieties; second, Mr. Breadmore.

Two bunches (blue): First, Mr. Breadmore, with Countess Cadogan and Navy Blue; second, Mrs. Brewer; third, Mrs. A. Tigwell.

Two bunches (orange shades): First, Mr. Breadmore, with Miss Willmot and Lady Mary Currie; second, Mr. Hugh Aldersey; third, Mr. R. Bathurst.

Two bunches (blush): First, Mr. Breadmore, with Modesty and Duchess of Sutherland; second, Mr. H. T. Michels, Kingston.

Two bunches (Picotee edged): First, Mr. Hugh Aldersey, with Maid of Honour and Golden Gate; second, Mr. Breadmore.

Two bunches (striped and flaked red and rose): First, Mr. Breadmore, with Galety and America; second, Mrs. Brewer; third, Mr. H. T. Michels, Kingston.

Two bunches (striped and flaked purple and blue): First, Mr. Breadmore, with Grey Mar and Princess of Wales; second, Mr. H. T. Michels.

Two bunches (bicolor): First, Mr. Breadmore, with Triumph and Prince Edward of York; second, Mrs. F. Brewer; third, Mr. Hugh Aldersey.

Two bunches (violet and purple): First, Mr. Breadmore, with Duke of Westminster and Duke of Clarence; second, Mr. Hugh Aldersey; third, Mr. H. T. Michels.

Two bunches (maroon and bronze): First, Mr. Breadmore, with Black Knight and Boreston; second, Mrs. Brewer; third, Miss Beekford.

Two bunches (lavender): First, Mr. Breadmore, with Lady Grisel Hamilton and Lady Nina Balfour; second, Mr. Aldersey; third, Mr. H. T. Michels.

Two bunches (fancy): First, Mr. Breadmore with Lottie Hutchings and Gracie Greenwood; second, Mr. F. Lloyd Davies; third, Mr. Michels.

Two bunches (magenta): First, Mr. Michels with Captivation and George Gordon.

Two bunches (corise): First, Mr. Breadmore with Coccinea; second, Mr. T. Lloyd Davies; third, Mr. Michels.

FLORAL DECORATIONS WITH SWEET PEAS.

Table decoration (trade excluded): First, Mrs. Rapley, St. John's, Withdean, near Brighton, with pink and red Sweet Peas, Maidenhair Fern, &c.; second, the Right Hon. Earl Spencer, K.G., Althorp Park, Northampton (gardener, Mr. Silas Cole), with splendid blooms of a pink variety; third, Miss M. M. West, Rydal Grange Road, Sutton.

In the open class for table decoration, Miss Cole, The Vineyard, Feltham, was first, using effectively the Rural Table Decorations; second, Messrs. Jones and Sons, Shrewsbury, with red and pale yellow varieties; third, Miss Dorothy M. Oliver, 97, Tollington Park, N.

Messrs. Jones and Sons, Shrewsbury, were first for a bouquet of Sweet Peas, and second for a wreath or cross. Miss C. J. Cole, Feltham, was first in the latter class, also for three buttonholes, an epergé, and basket of Sweet Peas.

NEW SWEET PEAS.

The best of the new varieties were:—
Scarlet Gem.—A beautiful soft crimson-red, very distinct. From Mr. Eckford.

Florence Molyneux.—White, flaked with pale rosy purple. Very dainty and attractive. (Dobbie and Co.)

Mrs. H. K. Barnes.—Buff-white. (Dobbie and Co.)

Agnes Johnson.—Buff-pink. (Dobbie and Co.)

Mrs. W. P. Wright.—Rich, rather crude purple. (Dobbie.)

Gladys Unwin.—A pretty, rich pink flower, with wavy edges. From Mr. W. J. Unwin, Histon, Cambridge.

Bolton's Pink.—Rich, deep rose-pink. A good colour. From Mr. Robert Bolton, Warton, Carnforth.

Margaret.—White. A flower of good form and substance. From Mr. E. Molyneux, Bishop's Waltham.

Miss Ettie Ingman.—Rich pink.

Mr. John Ingman.—Rose-scarlet, very bright. From Mr. S. Cole, The Gardens, Althorp Park.

Lathyrus latifolius grandiflorus alba was well shown by Hobbies Limited, Dereham.

Mr. J. Smith, 145, Disraeli Road, Putney, showed several dark purple varieties. The certificates were not awarded when our representative left.

NON-COMPETITIVE.

Mr. Henry Eckford, Wem, showed a collection of Sweet Peas that comprised some very distinct varieties. *Scarlet Gem*, a striking flower, more crimson than scarlet, was the best. Silver-gilt medal.

Messrs. H. Cannell and Sons, Swanley, Kent, showed Sweet Peas in quantity. The Cupid varieties were particularly good, and there were also bold vasefuls of the better known sorts. *America*, *Lottie Eckford*, *Prince of Wales*, and *Mauve Queen* are all new and distinct Cupid varieties. Gold medal.

Mr. E. Sydenham, Tenby Street Birmingham, and Mr. J. Williams, Oxford Road, Ealing, showed Rural Table Decorations prettily arranged with Sweet Peas and greenery. Silver-gilt medal.

Messrs. E. W. King and Co., Coggeshall, Essex, exhibited bunches of the Sweet Pea. Silver medal.

Messrs. Jones and Sons, Shrewsbury, arranged an extensive display of Sweet Peas in many good varieties. The pinks and salmon-pinks were very attractive. Large silver medal.

Hobbies, Limited, Dereham, had a splendid display of Roses, Carnations, and Sweet Peas. The Roses, effectively arranged in bowls and vases, with arches of *Crimson Rambler* behind, filled one end of the group. Carnations in some lovely varieties occupied the centre, and Sweet Peas filled the remaining space. Among the new Sweet Peas were *Golden Rose*, cream and rose; *Mrs. W. Wright*, bright purple; *King Edward*, crimson; and *Dainty*, bluish. Large gold medal.

Messrs. Dobbie and Co., Rothsay, N.B., had a delightful lot of Sweet Peas, all the varieties shown being new ones. *Florence Molyneux* (white and rose), *American Queen* (crimson rose), *Lord Rosebery* (rich deep rose), *Gracie Greenwood* (salmon pink), *Dorothy Eckford* (pure white), *Jessie Cuthbertson* (cream, flaked with crimson), and others were well represented. Silver-gilt medal.

Mr. Charles W. Breadmore, Winchester, arranged an extensive exhibit of Sweet Peas which would have been more attractive had there been less greenery used. The flowers were of good size and the leading sorts were shown as well as some new varieties. Gold medal.

Proposed International Exhibition, Manchester, 1905.

At a meeting recently held in this city, it was unanimously resolved that it is desirable to hold an International Exhibition in Manchester in 1905, and a committee was appointed to take such steps as they consider necessary to ascertain the views of those likely to be interested in such a project.

Ealing Flower Show.—Years ago specimen plants used to be well shown at the exhibitions of this society, which held its thirty-ninth annual display on July 8. The ever-encroaching builder and the consequent destruction of the smaller estates, account largely for their non-appearance nowadays. The writer's memory is carried back to a certain grand show held under the auspices of this society some thirty-five years ago in Ealing Park. The mention of this once-famous place recalls that, at one time, it was in the possession of the late Mrs. Lawrence, mother of the present well-known and esteemed president of the Royal Horticultural Society, Sir Trevor Lawrence, Bart. In 1868 Ealing Park was tenanted by H. S. Budgett, Esq., Mr. Cole the then gardener showed some magnificent plants, and the celebrated old firm of Messrs. John and Charles Lee—then in its prime—also contributed largely. The society is not supported at all as it should be by the residents. But to refer—very briefly—to the show under notice, which was held in Walpole Park. Visitors to these annual displays always look—and never look in vain—for the beautiful non-competitive contributions from Gunnersbury Park and Gunnersbury House. On this occasion Mr. George Reynolds sent from the former place a very charming group, while Mr. James Hudson contributed from Gunnersbury House beautiful new hardy Water Lilies. Likewise, not for competition, was a lovely group of Maples and Lilies from Messrs. W. Fromow and Sons, Chiswick. Turning to a few only of the strictly competitive classes, cut Roses made a good display. For forty-eight blooms Messrs. G. and W. Burch, Peterborough, secured first honours; Mr. Charles Turner, Slough, secured second place. The dinner-table decorations were very attractive. Mrs. A. W. Perkin gained first prize with a design in tricolor in honour of the French President's visit—an apt

and much admired act of floral patriotism. Mrs. H. B. Smith's beautiful bouquets of Orchids, &c.—not for competition—were a very attractive feature. A much-merited word of praise must be accorded to the cottagers' fine vegetable display—the allotments at Ealing doing splendid work in this direction—truth to tell the vegetables shown by the cottagers were superior to those shown by professional gardeners. Certainly no produce from this latter section equalled the six first prize dishes from John Grant, the champion allotment holder at Ealing this year. The show was well managed by Mr. George Cannon, the hard-working secretary.—Quo.

ANSWERS TO CORRESPONDENTS.

Names of plants.—*J. Goodfellow*.—The small-leaved *Veronica* is *V. carnosula*. Of the remaining two the one with the longer racemes is *V. salicifolia* var., and the other is *V. speciosa* var.—*B. E. C. Chambers*.—The name of the Rose is *Clio*.—*R. M. G., Portmadoc*.—Unfortunately, the plants were very much shrivelled, but apparently *Neillia Torreyi*. If a large shrub it is *Neillia opulifolia*. Some indications of the character of the plant are a great help.

Romneya Coulteri diseased (BRECHLEY).—Your *Romneya* appears to be infested with a fungus, probably mildew. You might try dusting it over with flowers of sulphur. If this does not answer and the plant gets worse it would be advisable to burn it to save the others from becoming infested.

Rose leaves infested (SUBSCRIBER).—Your Rose leaves are infested by the grubs of one of the saw-flies (*Blennocampa pusilla*), which feed on the undersides of the leaves, causing them to curl up at the edges, and eventually to roll up as you find them. No insecticide can be applied to the grubs, as they are safely sheltered by the leaf, and it would not be worth while to try and catch the flies before they lay their eggs. The best thing to do is to pick off the leaves as soon as they show any signs of curling and burn them.—G. S. S.

* Several "Answers to Correspondents" are unavoidably held over until next week.

ERRATUM.—A slip occurred in "Notes from Worcester-shire" last week. For *Cydonia Sagenti* please read *Sargenti*.

HOW ON

THE GARDEN

No. 1653.—VOL. LXIV.]

[JULY 25, 1903.]

THE INFLUENCE OF GARDENING ON HEALTH.

WE hear much in these days of cures for every mortal ill—the open air cure, the light cure, the Grape cure, and countless others. It is strange that no healer of body and mind should have before now suggested the gardening cure. True, gardening is made part of the daily routine in manic asylums, workhouses, and reformatories, where the occupation is supposed to produce a salutary effect on the unfortunate inmates; but as far as we know, for sane and orderly folk, gardening has never been raised to the dignity of a scientific cure. Yet how many are which are disguised under finer names may be gathered into the one focus of gardening! Open air, Heaven's own light of sunshine, the fruits of the earth, exercise of limb and muscle—all these are close at hand at the service, without money and without rice, of many a one who passes them by without so much as a thought. Alas! that there should be toilers without number in all our large towns to whom such blessings are virtually denied.

But, after all, as the old adage says, prevention is better than cure, and there is no question that the man who in leisure moments digs or hoes his bit of garden ground—who wages war against the ever-present weed or light—who buds his own Roses or in one way or another enjoys the product of his own skill, be he gentle or simple, will be far more likely to keep disease at bay and to be healthier and happier than his neighbour who cares for none of these things.

The reason is not far to seek. Gardening not only strengthens the physical powers. It is an engrossing occupation which, without overtaxing it, diverts and soothes the mind, while in its never-ending phases there is no monotony. If we tire of one aspect of it, we have it to turn to another to find rest and variety in an entirely different branch of its many ramifications. Each day—nay, one might almost say, each hour—brings its own change, and however much the gardener may plod, he need never be mind-weary. Infinite diversity is always within reach, and every day and every recurring season brings its own refreshment and rich reward. What else, may we ask, yields such large returns—such manifold interest on work or outlay?

To possess a garden is one thing, to be a

gardener is another and quite distinct matter. We venture to think, however, that more than one deep truth lies hid in the old story of the Garden of Eden. Is it not possible that we may find there, if we will, not Adam alone, nor even Humanity in him prefigured, but the individual man and woman placed by Eternal decree in the Garden of the World to dress it and to keep it. We may catch the echo of the Everlasting fiat that in all future time and through all the generations to come, each in his or her own order should work in one degree or another for the well-being, not of themselves alone, but of the race. Surely we may take it as a foreshadowing of the healthful labour joining hand in hand with gladness and plenty, which was fore-ordained to be the common lot. Certain it is that there is scarcely a child of either sex who has not the intuitive desire and love of "making a garden." Yet how seldom are children helped and encouraged as they should be by suitable training to find the pleasure these natural promptings lead them to expect. Rather than leaving them entirely to their own devices in these matters, how much better that limbs and brain alike should be developed while real—not make-believe—work goes on merrily in the children's quarters. Thus the gardening instinct would be fostered in early youth, and a good foundation laid for the rational use of it when they shall be children no longer, and need wholesome and restful relaxation from the storm and stress of after days. It is well to remember that the love and knowledge of gardening cannot be picked up like pebbles any day at will as we wander idly along the shore of life. The natural intuition once shrivelled up and withered may never again be galvanised into existence.

Ideal gardening of necessity is in the pure air of the open country, but we may see many an evidence of the craving for it in the window box of the bustling town—the dusty Ferns and hanging pot of Creeping Jenny in the London area—or the roof garden amongst the chimney pots of the City warehouse. And who shall say what healthful influence may not hover about the poor Geranium trying to grow in the cracked teapot of some sad-eyed, toiling seamstress of the East End slum?

We cannot all be practical gardeners, yet it would be well for this, our mighty empire of Great Britain and Britain beyond the seas, if a vastly greater proportion of us were proud to claim the title. It is not too much to say that in every home,

whether in town or country, there should be at least one inmate, if not more, to take a lively interest in the garden, and, where that is impossible, at any rate in the garden produce department. Even where no part can be taken in open air work, every household is happier where there is one who will undertake daily to rearrange the flowers and to control the proper use of fruit and vegetables in their season.

For whether gardening be looked at from the point of view of a fine art or of a practical science of daily life, it must be reckoned with, and either furthered to the great and lasting benefit of every member of the household or neglected to their serious detriment.

Within the last half century a radical and happy change for the better has come over our English School of Cookery. We have wisely taken a leaf out of our neighbour's book, and have learnt to diversify the solid meat dinners and suppers of our forefathers with many additions of vegetables and fruits, formerly unattainable, at any rate by the million. There are those, nowadays, who advocate a strictly vegetable diet, but without going to any such extremes we may safely say that an abundant daily supply of fresh fruit and vegetables is one of the most important factors of our national health, not to say of our national moral well-being. It is a very significant fact that after the last Bank Holiday, the increased orderliness of the holiday makers, and the reduced number of the usual police-court cases were commented on in the daily papers as one result of the greater facilities afforded to the populations of our large cities of buying cheap and wholesome fruit. Certainly it is good to be able to buy garden supplies, but happier he who has the chance of raising his fruit and vegetables by his own skill or by the skill of others under his own eye. Are we not all ready to acknowledge with acclaim the superiority of the produce of our own plot of Mother Earth?

Even the citizen cooped up by bricks and mortar and restricted thoroughfares is by no means exempt from the universal law of gardening which we maintain to be the heritage of human kind. If he has neither time nor opportunity to work with his own hands, it is still incumbent on him to do all that in him lies to promote the intelligent and worthy labours of others, and there are multitudinous ways in which this may be done.

It goes without saying that the owner of many a fine estate finds his happiest and most salutary occupation in looking into and

planning with his workpeople the details of his flower gardens and pleasure grounds, his orchards, his vineries, his wood and coppices. "I've tried most things," said such an one, "but never until I took up gardening have I had such keen delight in any pursuit, and the best of it is it leaves no bitterness behind." If anyone doubts the truth of the statement, and especially if without any particular organic trouble he is feeling somewhat ailing and weary in mind and body from the over-taxing of his nerves in the hurry and rush of life, let him begin at any point to which his fancy leads him and give a fair trial to an hour or two daily of garden work. It need not be hard labour, but if the gardening cure is to do any good there must be real work and real interest, whether of hands or head, within the precincts of the garden itself. A hundred ways are open. A neglected bit of ground to be converted into a thing of beauty—a kitchen garden to be better ordered and made more productive—fruit trees to be pruned or grafted and renovated, or fruit to be thinned or gathered and stored—a greenhouse with capability of flower beauty yet not as satisfactory as it might be—a strain of some favourite plant to be improved by selection and hybridisation—a shrubbery altered from a series of dull green bushes to a delightful belt of flowering and fruiting trees. In fact, there is literally no end to the gardening avocations presented by every acre of ground. Persevere only and we venture confidently to predict that the priceless jewel of health will be found lying hidden somewhere beneath the surface of the peaceful enclosure.

EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

STREPTOCARPUS FLOWERS FROM ALDENHAM HOUSE.

Mr. Beckett sends from the Aldenham House gardens a delightful gathering of *Streptocarpus* flowers, conspicuous for their pure and varied colourings. The rose shades were particularly clear and distinct, and we hope Mr. Beckett will aim at keeping the colours quite pure, and not trouble about the size of the flowers. Our correspondent writes: "Most of the flowers I send you are our own seedlings. My ambition has been to produce new colours and long flower-stems. I believe the *Streptocarpus* when its culture is better known will have a great future, as well-grown plants continue to bloom practically all the summer." The strain at Aldenham House is an excellent one for cutting. The stems are long, without any tendency to becoming overdrawn.

SEEDLING CARNATIONS.

Mr. Wythes sends from the Syon House gardens a superb gathering of seedling Carnations raised from seed supplied by Mr. Douglas, of Edenside, Great Bookham. The flowers were exceptionally varied in colour, large, and for the most part not split, and very sweetly scented. One, a white variety, was quite worth perpetuating. When Carnations so beautiful as this can be grown from seed, it is almost needless to trouble about named sorts.

LOGANBERRIES FROM A NORTH WALL.

Mr. Wythes also sends a few splendidly-grown Loganberries from a north wall. This is an excellent fruit, pleasantly acid in flavour, and very refreshing. Several notes and an illustration appeared in THE GARDEN of July 11 last.

LOTUS TETRAGONOLOBUS.

Mr. M. P. Forster, Fairfield, Warkworth, Northumberland, sends flowers of the interesting *Lotus Tetragonolobus* with the following note: "This is a very handsome rock plant here in deep soil and sun. *Eremurus himalaicus* and *E. robustus* have been very fine; *E. Bungei* is just opening."

ANCHUSA CAPENSIS.

Among the many interesting plants recently sent from Newry by Mr. Smith was this beautiful blue-

ANCHUSA CAPENSIS.

flowered biennial, a much reduced illustration of which we give. Its large blue flowers are very welcome in some rather shady corner, and give just the colour so many desire.

MULGEDIUM PLUMIERI.

Mr. Shillitoe, F.L.S., sends from Sydenham Hill, S.E., flowering-stems of this beautiful Mulgedium, with its tall stems and clearly coloured flowers. The following note accompanied this welcome flower for our table: "I forward you some flowering stalks of *Mulgedium Plumieri*. They are very fine this year, some being more than 8 feet high. I brought the seed many years ago from the Pyrenees. The clumps are now of large size, and numerous seedlings come up every year. The leaves are very long, deeply dentated, and varied in outline, it forms with the French grey-

coloured flowers a conspicuous and handsome object in the odd corners of the garden. It is quite hardy, and the leaves do not completely die down during even severe weather. I am surprised that one so seldom meets with it." We hope Mr. Shillitoe's note will draw attention to so little known a plant.

FLOWERS FROM A SCHOOL GARDEN.

Mr. Edward Peake, Rydal House, Earlsdon Road, Norwich, sends Sweet Peas and *Antirrhinum* from a school to which we have on more than one occasion directed the attention of our readers. Mr. Peake is accomplishing a sound horticultural work among the boys under his charge, and we know this from the many good things that come from the school. The flowers sent showed that the most intelligent culture had been brought to bear upon the plants.

SOME DELIGHTFUL EVERLASTING PEAS.

Mr. R. Dean sends some charming varieties of Everlasting Peas with these words: "Enclosed are a few Everlasting Peas from plants growing as bushes against Apple trees in my seed grounds at Hounslow, and therefore having no special cultivation. The white, if grown under glass, or if it had special culture, would be as fine as anything seen this season. The storms have somewhat damaged the blooms. I have two or three forms of *Delicata*; the one sent is the only one yet in bloom."

The flowers were remarkable for their abundance, neatness, and variety of colouring. Mr. Dean sent the handsome *L. grandiflorus* with its big purple flowers; *Delicata*, a lovely warm rose-purple shade, very bright; *Queen of the West*, a beautiful white, very free; and *Latifolius superbus*, intense purple-crimson.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

CASSIA LÆVIGATA, *Desfontainia spinosa*, *Lagerstrœmia indica*, *Lonicera etrusca*, *Paecliflora capslaris*, *Pavetta caffra*, *Petrophila pulchella*, *Solanum glaucum*, and *Tibouchina heteromalla*.

Orchid Houses.

Arides suavisimum, *Angræcum eichlerianum*, *Bifrenaria atropurpurea*, *Bulbophyllum Deari*, *Calanthe japonica*, *Cattleya granulosa*, *Dendrobium Calceolaria*, *D. endrocharis*, *D. formosum* var. *giganteum*, *Epidendrum scriptum*, *Eulophia monophylla*, *Oncidium crispum*, *O. longipes*, *O. trulliferum*, *Polystachya rhadopera*, *Renanthera storisii*, *Rhynchostylis retusa*, and *Sarcanthus pallidus*.

T Range.

Adenocalymna nitidum, *Amasonia calycina*, *Anigoanthus flavida*, *Aphelandra chamissoniana*, *Aristolochia gigas* var. *Sturtevantii*, *Costus speciosus*, *Crossandra undulatifolia*, *Emilia amplexicaule*, *Eranthemum tuberculatum*, *Gesnera cardinalis*, *Isolomas* in variety, *Notouia trachycarpa*, *Physostelma Wallichii*, *Pinguicula caudata*, *Rondeletia strigosa*, *Tillandsia Lindenii*, and *Vernonia scorpioides*.

Greenhouse.

Begonia Corbeille de Feu, *Campanula Vidalii*, *Celosia cristata* var. *pyramidalis*, *Clerodendron fallax*, *Datura fastuosa*, *Eupatorium ianthinum*, *Francia appendiculata*, *Lantana Camara* var. *Lobelia tenuior*, *Rivina humilis* in fruit, *Schizanthus retusus*, *Statice sinuata*, and *Trachelium cœruleum* var. *album*.

Rock Garden.

Aconitum Lycoctonum, *Arnica longifolia*, *Boykinia aconitifolia*, *Campanula alliariifolia*, *C. Scheuchzeri*, *Dianthus viscidus*, *Epipactis palustris*, *Erigeron glaucum*, *Erythraea Massoni*, *Gentiana straminea*, *G. tibetica*, *Gypsophila libanotica*, *Meconopsis Wallichii*, *Enothera missouriensis*, *Platycodon grandiflorus* var. *Mariesii*, *Potentilla nepalensis*, *Prunella grandiflora*, *Sidalcea Listeri*, *S. malvæflora*, *S. spicata*, and *Zygadenus elegans*.

Arboretum.

Clematis crispa, *C. Hendersonii*, *C. integrifolia*, *C. intermedia*, *C. Pseudo-flammula*, *C. viticella* var., *Genista etnensis*, *G. aspalathoides*, *G. nigricans*, *Indigofera decora*, *Notospartium carmichaeliae*, *Spiraea japonica* and var., *S. Menziesii* and var., *S. Douglasii*, and many other things.

Herbaceous Borders and Ground.

Aconitum stoerkianum, *Astilbe chinensis* var. *japonica*, *Cimicifuga americana*, *C. racemosa*, *Delphinium* (numerous species), *Eucharidium concinnum*, *Gilia coronopifolia*, *Lavatera cachemiriana*, *L. thuringiaca*, *L. trimestris*, *Malcolmia littorea*, *Malope trifida*, *Nepeta* (various species), *Nymphæas* in variety, *Pentstemon barbatus*, *P. Hartwegii*, *P. heterophyllus*, *P. perfoliatus*, *P. Richardsonii*, *P. spectabilis*, *P. Wrightii*, *Salvia sclarea*, *S. virgata*, *S. viscosa*, *Sidalcea* (numerous species), *Silene echinata*, *Spiraea digitata*, *Thalictrum* (numerous species), *Verbascum* (numerous species), *Verbena Aubletia*, *Veronica* (numerous species), and very many other things.

Borders round Palm House.

Agapanthus umbellatus var. *Leichtlinii*, *A. u. var. mooreanus*, *Albica Nelsoni*, *Bravca geminiflora*, *Crinum Powellii*, *Opuntia camanchica*, *O. fragilis*, *O. mesacantha*, *O. polyacantha*, and *Rosecea purpurea*.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

- July 29.—Chesterfield Horticultural Show.
August 3.—Basingstoke, Newbury, Sheffield, Grantham, Lichfield, and Headington Horticultural Shows.
August 4.—Royal Horticultural Society's Committee meet; Abbey Park Flower Show, Leicester (two days).
August 5.—Dudley Horticultural Show.
August 6.—Midland Carnation and Picotee Show at Birmingham (two days).

The Dean of Rochester has expressed his intention of being present at the gardeners' dinner to be held on Michaelmas Day next. We are quite sure Dr. Hole will have a great reception.

The illness of Mr. W. Marshall.—At a meeting of the fruit committee, held at Chiswick on the 14th inst., Mr. George Bunyard in the chair, a vote of sympathy was passed by those present with Mr. Marshall in his long illness, and a sincere hope expressed that he would soon be restored to his usual good health. *Ex officio* (as a member of the council) Mr. Marshall has occasionally presided at the meetings of the fruit committee at Chiswick.

Thornton Heath Rose Show.—At this excellent show on Wednesday, the 15th inst., it was interesting to notice that Mr. H. E. Molyneux, who has quite a small garden at Balham, secured many prizes. He gained two firsts and one second prize, and the latter box for Teas contained a superb flower of Maman Cochet, which gained the silver medal for the best bloom in the exhibition. Mr. Molyneux is one of our most valued contributors. He knows not only how to grow Roses, but how to show them. The show, we are pleased to know, was a great financial success.

Market gardeners and their rent. In view of the losses sustained by reason of the late frosts, which have practically ruined their fruit crops, Mr. Leopold de Rothschild has remitted to the market gardener tenants upon the Gunnersbury estate 15 per cent. of the rent due for the past six months.

The new Curator of the Birmingham Botanic Gardens.—We are pleased to hear that Mr. T. Humphreys, assistant-superintendent of the Royal Horticultural Society's Gardens at Chiswick, has been appointed Curator of the Birmingham Botanic Gardens, in place of Mr. Latham, who is retiring after many years of devoted service. It is interesting to know that Mr. Humphreys first began his career with Messrs. J. Dickson and Sons, of the Newton Nurseries,

Chester, in 1882, and stayed with that firm for five years. From there he went to Kew, and was at one time sub-foreman in the Arboretum, then to the Royal Horticultural Society's Gardens at Chiswick. The committee of the Birmingham Botanic Gardens have made a wise selection. Though of a retiring disposition, Mr. Humphreys has a quiet determination that makes for good work, and his courtesy and kindness have won him a host of friends. For many years he has acted as secretary to the floral committee, and at the last meeting Mr. May, the chairman, acting in the absence of Mr. Marshall, referred in terms of high praise to Mr. Humphreys' quiet and successful endeavours, both at Chiswick and upon the committees, to carry out his official duties. A small sub-committee has been appointed to give practical proof of the committee's recognition of their secretary's work, and in his fresh sphere of labour the new Curator has our hearty goodwill.

Fruit and Flowers at the Woodbridge Show.—This, as far as I know, is the only show where a special class is devoted to ornamental stands of flowers and fruit, arranged for effect. I think the idea is an excellent one. It is not every gardener who can compete in the large class for decorated tables of fruit, and few shows, comparatively speaking, can afford the prizes necessary. In these decorated stands we have the idea carried out, and in the classes for then it is possible for a great number of small growers to compete. It was certainly one of the prettiest and most interesting classes in the show, and the stands exhibited were beautifully and artistically arranged, and, judging by the crowds of people surrounding them, were as much admired as any feature of the show.—T. E.

National Chrysanthemum Society's outing.—On Monday, the 13th inst., the members of the National Chrysanthemum Society had their annual outing, the place visited this year being Park Place, Henley-on-Thames, the residence of Mrs. Noble. The party took train to Reading, and from there went by river to Henley. The water trip was much enjoyed, as also was the visit to the beautiful and well-kept gardens of Park Place.

The Royal Horticultural Society's Committees' cricket match.—The members of these staid judicial bodies again, as last year, have agreed to play cricket, the place this time being Holland Park, Kensington, the day Saturday, August 8, and the time 11 a.m., with luncheon at 1 p.m. The delightful day at Gunnersbury Park, so heartily enjoyed last year, will not be readily forgotten. Mr. W. Howe will captain the floral committee side, and Mr. G. Woodward the fruit members. All members of these two committees are invited to play, and the members of other committees, with their friends, are invited to attend and see it. The occasion should be one of pleasant sociability. Generally the committees meet only to work. On this one occasion they may be excused if they are a little playful.

A new Strawberry (Givon's Late Prolific).—At a meeting of the fruit committee of the Royal Horticultural Society at Chiswick, on July 14, a very fine basket of a late Strawberry was exhibited by Messrs. Bunyard, Maidstone, and if the variety had not previously received an award, it would certainly have had one now, as it proved to be a delicious fruit and was much admired. Givon's Late Prolific is a dark red firm fruit of roundish oval shape, but I noticed that its shape varies, a few being of wedge form. The flavour is excellent—neither too sweet nor too acid. I think a briskish flavour with late Strawberries makes the fruit more palatable, but there is one objection to this useful addition to the late kinds, and that is it is not late enough. There is yet room for a really good late variety, as Strawberries of this class are very scarce. We find that the latest varieties grown on a north border are not as late as described; but on the other hand the raiser has given us an excellent fruit, which I intend to give ample scope in the position named. It will be most valuable to follow the mid-season varieties, and its firmness will make it valuable for

sending away. It will certainly be a great gain to Strawberry growers.—G. WYTHES.

Long-foot Cabbage.—According to the *Agricultural News* of the West Indies, a very hardy acclimatised variety of the common Cabbage is found occasionally in the West Indies, chiefly in negro provision grounds. It has bright green leaves without the glaucous bloom usually found on some Cabbages. It is said to thrive anywhere, and is evidently well suited to dry, arid conditions, where no other kind of Cabbage will grow. The negro name of "Long-foot" at once suggested that it was not unlikely to be closely related to the Cabbage grown in the Channel Islands and in the Canary Islands for the purpose of making walking sticks from its stems. This is evidently the case. The growth of the stem is promoted by constantly stripping off the lower leaves. Some specimens have been known to attain a height of 10 feet. The Long-foot Cabbage may, however, have other uses, and that is to supply green food for man and beast in times of scarcity. We, therefore, commend this hardy and apparently neglected vegetable to the attention of those living in remote and arid localities. It is easily propagated by cuttings.—J. R. JACKSON, *Claremont, Lympstone, South Devon.*

Rose Brailwick Fairy.—This is a new rambling Rose that is not yet in commerce, but is of the class that is wanted. In colour it is almost white, with the faintest shade of cream; the buds are small, elongated, and of perfect shape for buttonholes. It will also be in great demand for trade purposes. The plants I have seen at Brailwick, Colchester, are immense growers, with very rich brown foliage, which gives a striking effect to the flowers when in bloom. A very pleasing feature is its strong scent, reminiscent of Almonds when crushed. It will be suitable for pyramids, pergolas, arches, or would make an excellent hedge. A very good bunch was exhibited by the raisers, Messrs. Frank Cant and Co., at the Holland House show this year.—H. E. MOLYNEUX.

Flowers for Butterflies.—It surprises me to see several flowers mentioned for this purpose, and the one which I have always found eminently the best omitted. I refer to *Sedum spectabile*, which in August and September generally monopolises the attention of the butterflies in my garden in Cheshire. I have counted as many as twelve butterflies at a time on one head; they consisted of Red Admiral, Peacock, Comma, and Small Tortoiseshell.—C. WOLLEY DOD.

When I was a boy specially noticeable were the large and beautiful butterflies that used to frequent the breadths of large single Sunflowers grown in a Northern nursery for seed production. Perhaps these gorgeous insects have varied their tastes since those days, but certainly since single Dahlias came into culture so largely butterflies seem to have favoured them beyond all other flowers. I have seen some beautiful ones on single Hollyhocks, and most oddly of all on large double African Marigolds. There seems to be no doubt that large flowers of striking colours do attract these winged insects very much, but all the same they seek for the intoxicating, or rather satiating, secretion which these flowers possess in abundance. To secure visits from these charming creatures, but not to destroy them as vandals, it is well to have in a garden flowers that specially attract them.—D.

Pelargonium Paul Crampel.—This Pelargonium, referred to by Mr. Burrell on page 39, affords another illustration of the fact that a long time often elapses after a plant has been distributed before its merits are recognised, while, on the other hand, some bound at once into popularity. The variety Paul Crampel was distributed by M. Lemoine in 1892, so that it is, as far as soft-wooded subjects are concerned, quite an old plant, yet has only lately become generally grown. The same thing happened in the case of the double-flowered zonal variety F. V. Raspail, which, distributed by M. Lemoine in the spring of 1878, was for some years almost lost to cultivation, till it was taken in hand by some of our market growers, and for a long time held its own as the most popular double-flowered variety in cultivation, to yield only at last to its sport F. V. Raspail Improved.—T.

The influence of climate on fruits.

We are all familiar with the general fact that certain fruits are grown in certain regions, that we have tropical, sub-tropical, and temperate fruits, and even that the Peach belt and the Apple belt do not coincide. Probably most of us know, some, perhaps, by rather disappointing experience, that certain varieties of fruits are not so hardy as others. But have we ever considered at all carefully how a difference in climate may influence the form, quality, and other characteristics of any particular variety of a fruit? I imagine that very few of us have done so, and perhaps fewer still have had an opportunity to examine personally samples of the same variety of fruit from different countries, or different sections of the same country, and note the differences and peculiarities. The writer had several such opportunities the past season, having received several barrels and boxes of specimen Apples from different parts of Canada and the United States, and the modifications of varieties were most remarkable. Some sorts which are very well known to me as grown here in Nova Scotia were so changed as really to be scarcely recognisable by their general characteristics. When I came to study them more carefully, to note dots and other skin characters, there were usually some points which suggested our Nova Scotia Apples of some variety, but even then it was largely a guess, and I needed the label to verify my suspicion. The most conspicuous changes noted are that our Nova Scotia Apples are longer, more inclined to be ribbed, and of a deeper darker red than the same variety grown in Ontario or in Massachusetts. In the Northern Spy, for example, the Ontario Apple is quite oblate, and is very smooth and regular in outline, with the basin or blossom end very slightly corrugated, if at all. The Nova Scotia Spy, on the other hand, while occasionally flattened, is typically a long conical Apple, with a deeper basin and cavity, and both of these depressions rougher and more corrugated. Nova Scotia and Massachusetts Baldwins show the same differences to even a greater extent. The Massachusetts Apple is a very smooth fruit, rather oblate, with neither basin nor cavity corrugated to any extent; while our Nova Scotia Baldwins are proverbially rough in outline, are conical and approaching oblong in shape, and are always corrugated at the blossom end, and with the five points which mark the five ovaries always prominent. In colour, too, there is a marked difference; while the Massachusetts fruit is a handsome scarlet the Nova Scotia Baldwin is much darker, more of a crimson, or even brownish or bronze. In talking with my good friend Mr. R. W. Starr, who knows more about Apples than any other half-dozen men in Nova Scotia put together, I find that he had much interesting correspondence with the late Charles Downing of New York (America's greatest pomologist, to whom he often sent fruit) on this subject. Mr. Downing repeatedly expressed surprise at the much deeper colour of our Nova Scotia Apples, and the tendency of such sorts as Rhode Island Greening to have a blush on the cheek as grown here, while in his district they are practically green. But not only are the external characters of the fruit modified; the flavour and quality seem equally susceptible of change. Mr. Downing considered the Apples from Nova Scotia as of the highest flavour, and said that from only one other section, the Cumberland Mountains of

Tennessee, did he find their equal in quality. He attributed this difference largely to our cooler, more northern climate (the higher altitude of the Cumberland Mountains giving practically the same effect). President Schurman, of Cornell University, has expressed the same opinion, saying that there is a marked difference in the King of Tompkins as grown in New York and in Nova Scotia.—F. C. SEARS, *Director Nova Scotia School of Horticulture.*

Candle Trees.—Amongst the many peculiarities of vegetation the fact that candles grew on trees is one that has often been stated, but never corroborated to the satisfaction of those who would wish to cultivate such a plant for the sake of providing the homely and domestic candle. Yet a Candle Tree has been known to cultivation as a stove plant for a very long time. These Candle

of Apples, which is said to be communicated to some extent to the flesh of animals fed upon them, but which is entirely given off if the food of the animal is changed a few days before killing. The fruits of *P. edulis*, which are shorter and rougher, are, as the specific name indicates, edible, being eaten by the natives. While writing these notes, *THE GARDEN* for April 18 came to hand, and in it, on page 254, a paragraph on "A few notable Trees," the value of which would have been enhanced if the writer had given the scientific names of the trees. With regard to the South American Cow Tree, I may, perhaps, add a few words by way of illustrating the manner in which botanical facts are twisted, contorted, or enlarged upon by the unscientific Press. A few years ago when a visitation of diphtheria was traced to a certain milk supply, note appeared in one of the daily papers on the

very Cow Tree now under consideration, and a suggestion made that such plants should be cultivated in our gardens to supply the family milk by tapping the tree instead of milking the cow, a rather expensive experiment if our gardens had to be turned into heated glass houses to suit the requirements of a South American tree.—JOHN R. JACKSON.

Tigridias.—Few things in the summer garden are more gorgeous than the Tiger Flower (*Tigridia Pavonia*), of which there are several forms. I have several flowers out now, and though they remain for a day only, they appear in succession. I plant the bulbs in spring in a very warm southern corner in light soil. *Rosea* is a favourite variety.—J. Henley.

Stonehenge and the barbed-wire fence.—The secretary of the Commons and Footpaths Preservation Society writes: "The Wiltshire County Council has now definitely declined to protect the public rights prejudiced by the obstruction by means of a high barbed-wire fence of all the roads leading to Stonehenge. The council has suggested that the cost of an action involving such far-reaching principles as the preservation of the right of public access to Stonehenge should be borne by the public generally. The Commons and Footpaths Preservation Society has, therefore, been reluctantly forced to appeal for funds to enable the grievance of the public to be placed before a court of law. The society has determined to endeavour to raise a guaranteed sum of £2,000 to provide against every possible contingency, although this sum will probably not be needed, as the society is advised by several eminent legal experts that it can expect to establish the public rights. Already the members of the society have guaranteed £1,000 of the sum needed. The

action is not contemplated in any vindictive spirit against Sir E. Antrobus, the landowner, whose motives in the matter of the enclosures are fully recognised and appreciated by the society. But it is imperative that the claim that Stonehenge is not a place to which the public can enjoy a right of way should not be allowed to go by default, otherwise in the future it will be most difficult, if not impossible, to protect any path giving access to a view-point or to a place of historic interest. The question of the preservation of Stonehenge itself is a side issue, for the monument may be permanently safeguarded by the State by means of the Ancient Monuments Acts without enclosure, without expense to the landowner, and without depriving the owner of his legal interest in the stones."

THE TIGER FLOWER (*TIGRIDIA PAVONIA*).

Trees are natives of Mexico and Central America, and belong to the order Bignoniaceae; they are closely allied to the Calabash. Three species only are known, and the two most important are *Parmentiera cerifera* and *P. edulis*. The name of the genus is derived from a French writer *Parmentier*, and the first-named species refers to the waxy appearance of its long slender cylindrical fruits which hang in clusters like a bunch of candles. It is a native of Panama, where it is known as the *Palo de Velas*. The fruits are commonly from 2 feet to 3 feet long, and sometimes even 4 feet. Dr. Leemann writing of this tree says:—"A person entering the forests which are composed of this tree almost fancies himself in a chandler's shop, for from all the stems and older branches these fruits are suspended." When ripe they give off a small

Japanese Maples.—Among the numerous species and varieties of deciduous shrubs comparatively recently introduced into English gardens none is of greater beauty and interest than the Japanese Maples. Small colonies of them suitably planted are sure to claim attention from all plant lovers, whether owners of gardens or their friends. There is a refinement and delicacy of texture and colouring in their foliage that in my opinion no other hardy shrubs possess during the summer and autumn months. With us some planted about twelve years ago have proved quite hardy. One great advantage these Maples have is that in small gardens they do not outgrow their position so soon as many deciduous shrubs do. I am sending you a photograph of a very fine specimen of *Acer palmatum purpureum* I saw at Lathom House, Ormskirk, some time ago. It is the largest Japanese Maple I have yet seen. Mr. Ashton, the gardener to Lord Lathom, is naturally very pleased to draw the attention of garden lovers to its size and general beauty.

Garden vases.—I am reminded of this subject in consequence of recent rearrangement of some vases in the grounds here. So far as I can make out they have been in position over sixty years—at least, I have known them for more than half that period, and so far as ordinary wear is concerned they are as good to-day as when I first saw them. They are made of some mixture of Roman cement and hard sand, and at first sight would be taken as cut out of stone. They vary in size and shape, from large urn-shaped ones, standing on 4 feet high square bases made of the same material, to the ordinary vase about 3 feet high. I noticed the maker's name stamped at the bottom of one of them as Austin, New Road, London. I can find no trace of the firm now in the "Horticultural Directory," though I seem to remember that a firm named Austin and Seeley had a vase stand not far from King's Cross Station in 1862. Be that as it may, what I wish to emphasise is the excellence of the material for making outdoor garden vases. We find plants generally used for filling vases to grow much more freely in them than in marble vases, of which there is a number on the terrace here. I feel sure the same remark would apply in the case of those made of terracotta or cast-iron. For older gardens one great advantage these artificial stone ones have is that in time their outer surfaces get partly covered with the smaller lichens and other allied forms of lower vegetative growth. To my mind this adds much to their beauty and interest. With ordinary care there is no more risk of injury from chipping than in the case of terracotta ones. Unfortunately, the photographs I have are not suitable for reproduction.—H. J. CLAYTON, *Grimston, Tadcaster.*

Lettuces.—There is undoubtedly a wide difference between Lettuce stocks, not only in relation to hearting and to edible quality, but also to permanence. Some are of so fugitive a character that they bolt off to flower even before hearts are formed. Those are no good, and their existence rather indicates that the seed has been saved from bolters rather than from good hearting stocks. But stocks of that kind, whilst proving exceedingly exasperating, do the vendor much harm, as no grower cares to be so deceived twice. It is far wiser to purchase good stocks of enduring character at higher prices than to obtain cheap seeds that result in worthless products. Those who occasionally indulge in Lettuce trials soon find how wide is the difference between good and indifferent stocks. When at Clendon Park, Guildford, the other day I was much interested in the Lettuces I saw growing there. Mr. Blake keeps up a very constant supply, and as evidence of that he had of five diverse varieties no less than four different plantings, with a fifth just coming on. The varieties were all of Messrs. Sutton and Sons, and included their mammoth White Cos, a tall form, pale green in colour; Giant Cos, a green form of the Paris White, and a first-rate one to heart in firmly; Favourite, a curled Cabbage variety, pale in colour, but carrying big solid hearts, with few outer leaves; Giant Cabbage, a fine plain-leaved form that gives large hearts and stands well, also has the merit of

being exceptionally good when cooked as an ordinary Cabbage. Smallest yet for edible or salading purposes, the firmest, sweetest, and most crisp was Little Gem, a variety classed as a Cos, and if so it is certainly a very dwarf, compact one. Planted 10 inches apart on good ground, as is done at Clendon Park, it produces very firm solid heads, and is one of the nicest in cultivation. To have good Lettuces in hot weather seed should be sown thinly in well-watered drills on a north border, the plants being thinned down to 9 inches apart.—A. D.

Forcing plants by means of ether. At the last exhibition at Cours la Reine there was shown a little model of an apparatus for submitting to other fumes shrubs which were intended to be forced. M. Aymard of Montpellier, the founder of this process, has used it for two years with great success. He made a communication recently on the subject to the Horticultural Society of Hérault, from which we extract the following passages, bearing more particularly on the amount of ether to be employed: (1) At the rate of 175 grammes per cubic metre, and with forty to forty-four hours' etherification, efflorescence started at the end of sixteen days. Blossoming was full by November 21 or 22 to December. (2) Using 150 grammes per cubic metre, and with thirty to thirty-six hours' etherification, efflorescence started at the end of sixteen days. (3) With 100 grammes per cubic metre and twenty-four to thirty-six hours' treatment, efflorescence began at the end of fifteen days. These figures may require some explanation. It should be noted that all these experiments were made in the open air, and were subject to atmospheric variations. Thus it was quite possible that one or two etherifications made during mild weather might have succeeded better than others. Operations with 100 grammes of ether per cubic metre were made only twice, as a too clement winter renders the ether useless; but Nos. 1 and 2 have been repeated a number of times. It is pretty certain that with a colder climate the doses used must be stronger; at any rate the apparatus should be kept in a closed room where it could be heated in some way.

Destruction of the woodlouse.—The number of lauded preparations for the destruction of the woodlouse is pretty considerable; each orchardist possesses his own favourite remedy, more efficacious, doubtless, than all the others; nevertheless, the woodlouse continues to work havoc. A writer in *Le Journal d'Agriculture Pratique* mentions a process which has given very satisfactory results. In an orchard where he had a free hand to do anything to destroy this pest, M. Mangin had tried a large number of recipes; all of them yielded negative results. At last he hit upon a mixture, by means of which he has destroyed whole masses of woodlice. This mixture consists simply of a varnish composed of light gum-lake mixed with 5 to 10 per cent. of lysol. The "body" of this varnish, being constituted of alcohol, moistens and penetrates the parts which shelter certain species of woodlice. All the parts invaded by the pest are painted over with a brush or powdered, but this must be done only in very dry weather. The alcohol evaporates and the gum-lake "fixes" the woodlice, preventing them from escaping by flight from the toxic action of the lysol. At the end of two or three paintings the lice will be entirely destroyed, not only upon the branches, but also upon the green parts of the tree. The preparation of this product is very simple. A quantity of light-coloured varnish is procured, such as is in common use among cabinet-makers and polishers, and this is mixed with once or twice its volume of denatured alcohol and with 5 to 10 per cent. of lysol. A remedy so easily prepared, and which has been used with successful results in France, should be worth a trial here.—F. J. HARDY.

Humea elegans.—When grown successfully this is most effective, but it seems a little difficult to manage. I have always been able to grow the plants well enough, but have failed to flower them sometimes, and I do not feel sure if it has been because of late sowing, or if it is usual for a percentage to fail. On one occasion I raised

eleven seedlings, all of which grew into fine plants, and were potted on into 8-inch pots. Of these two plants failed entirely to flower, though they grew well. The others threw up grand panicles of inflorescence, attaining fully 8 feet high. Last year from a large batch of plants only a very few flowered. A few of the smallest plants were kept over, and this season I was asked to put the tops in as cuttings. I certainly thought it a most unlikely subject to root. However, every cutting rooted, and they have since flowered, but have not made such large plants as they usually do when grown on from seed.—A. HEMSLEY.

Rabbits barking trees.—A Fellow enquires how best to protect young trees from rabbits. The best way, no doubt, is to wire them round with small meshed wire at a distance of 6 inches or 8 inches from the stem, taking care to let the wire go down at least 6 inches below the surface to prevent the rabbits burrowing under, and having it high enough to keep them from leaping over. Save, however, with a few specimen trees, this is generally considered too expensive, and as a rule tar is used instead. But tar is not always satisfactory, as it sometimes itself kills the trees, particularly if applied after the rabbits have commenced to bark them. In any case Stockholm and not gas tar should be used, and a better plan than putting it on the young trees is to drive in a few stakes round the stem and smear them with the tar, as rabbits have a great dislike to their fur sticking to anything. We have found the following preparations very useful for the purpose: (1) Davidson's Composition, made by a Leith firm; (2) a teaspoonful of tincture of assafoetida in half a bucketful of liquid soil applied with a brush, perhaps twice during the winter; (3) a mixture of lime, water, and cow manure, pretty strong, is excellent; so is any strong-smelling grease.—*From the Royal Horticultural Society's Journal.*

Potato disease.—Early Potatoes purchased in the market have already shown a good deal of disease, although chiefly on the bud ends, which are, as a rule, the parts of the tubers least covered. That fact serves to show how important it is that in moulding up the plants the soil be made fairly thick, as in such case it acts as a protective medium. No doubt with disease sports already prevalent in the atmosphere the recent heavy rains did wash them into contact with the tubers and thus produce exactly similar action to what is seen when leaves or stems are affected. But full or complete moulding cannot be done when Potato rows are planted close together. To enable earthing to be well done, the rows should be fully 30 inches to 36 inches apart and a second moulding given after tubers have been formed. Close planting is not at all economical, not only are more seed tubers required, but it checks leaf development, and for the production of an abundance of sound, healthy, starchy tubers the leafage cannot well have too much light and air. It is always the lower and least exposed leaves that first fall a prey to the Potato fungus, and from these spores are bred in great abundance. No doubt the present heat will check spore action materially during the day; but because there is generally so much of moisture in the soil, considerable moist or humidity is generated during warm nights, and this air moisture accelerates spore growth with great rapidity. If the heat continues presently the humidity at night will be greatly lessened, and if on breadths the fungus has not appeared then it may not be seen for some time. Unfortunately in our climate heat waves are so often followed by thunderstorms, and these favour fungus development materially. It will be wise in any case to have at disposal plenty of copper and lime solution for spraying the plants early, and once or twice later at intervals of a couple of weeks to save them so far as possible should the disease be prevalent.—A. D.

Verbenas.—These old favourites certainly deserve more attention. Your note in THE GARDEN, page 21, reminds me of the time when they were used extensively for bedding. The most popular varieties were Defiance, scarlet, a very free spreading sort, the shoots rooting into the ground at every joint, the flowers, though small, were very

bright in colour and produced in great profusion; Snowflake, the white variety, was not quite so vigorous and required pegging down; Purple King, bright purple self, also was a little difficult to manage, being much subject to the black spot you refer to, but on account of its distinct colour was more in demand than either of the others. The time for growing collections of named varieties is undoubtedly past, but in my early experience keeping up a collection of these was rather an important matter, and very difficult it was to keep some sorts through the winter. Of the varieties you refer to Ellen Willmott is one of the finest we have. In going through Covent Garden Market a few weeks ago I was much struck with the bright effect produced by masses of this plant grown in pots; they were to be seen on several stands. This beautiful Verbena is evidently destined to become one of our most popular market plants. I also noted a very bright scarlet variety named King of Scarlets; this may be the same thing as Warley, at any rate it is a fine Verbena, but as we have so many good scarlet pot plants it may not become such a general favourite as the pink. Verbenas are easily raised from seed; by careful selection vigorous and free flowering varieties of distinct shades may be propagated from cuttings for a season or two, and a vigorous stock kept up by adding fresh seedlings.

Tropæolum Sunlight.—This beautiful yellow climbing variety, which came from America a few years ago, varies considerably when raised from seeds, but by careful selection a large percentage will come quite true. Some more resemble the dwarf varieties in habit, and flower very freely. The deep golden-yellow flowers have a pleasant perfume, a much more decided scent than I have found in any other variety. The Tropæolums are not generally recommended for cut bloom, but I find they are very useful. I recently cut some of the semi-dwarf shoots and flowers together, and after being in water a week the shoots had grown, and several blooms which were quite small buds when cut had developed.—A. HEMSLEY.

Weather and ripening Peaches.—It may be of interest to you and your readers to know the effect of the weather for the last five years on the ripening of Peaches out of doors on a south-west wall. Alexander and Waterloo were planted in 1891. I see no difference in the fruit, both are clingstones, medium size, and highly coloured. 1899, July 9, Waterloo was ripe; 1900, July 12, Waterloo and Alexander, fruit small, ripe and falling; 1901, July 10, Waterloo, ripe; 1902, July 15, gathered a dish of Alexander later than usual; 1903, July 13, gathered from both trees. One year, but I cannot find the note of it, Alexander was gathered on July 6. A good early Nectarine with me is Advance, heavy cropper, fruit medium size, plenty of fruit now, but the snails are attacking it.—J. A. PORCH, *Edgarley House, Glastonbury.*

THE ROSE GARDEN.

NOTES ON NEW DECORATIVE OR GARDEN ROSES.

I HAVE been collecting my notes for the last twelve months, and the difficulty is to condense them. With exhibition Roses there is a definite standard, and the raiser knows that if a Rose does not come up to that standard it is useless calling it an exhibition variety, but one cannot help being suspicious that a standard is quite lost sight of when we come to deal with decorative Roses. Any Rose not up to exhibition form is immediately labelled decorative. This applies most strongly to our continental raisers. Out of curiosity, I ran through the catalogues of new Roses offered for sale, year by year, during the last seven years by one of our largest firms out of a total of roughly 260 Roses all raised on the continent. Thirty-five

only are now grown in sufficient quantity to be worth cataloguing in that same firm's general list for 1902.

The standard for decorative Roses should be as stringent as is the exhibition Rose standard. I presume there is a demand for these new Roses at 3s. 6d. each or they would not be catalogued; but one wonders where it comes from. One ought to remember, perhaps, that the continental Rose is handicapped by our climate, and does not therefore stand quite the same chance that the British-raised Rose does.

These facts have made me rather shy of dealing with new Roses from the continent, and if these notes consist mostly of comments on home-raised Roses, the reasons are not far to seek; it follows that if a continental Rose is well-spoken of it is worth trying.

Ards Pillar.—I referred to this Rose in the notes on exhibition Roses in the number of July 4, but undoubtedly its place will be among the decorative Roses. It is an excellent pillar Rose, rich velvety crimson, cupped form. Its raisers—Messrs. Dickson of Newtownards—have done much for the exhibition Rose, but some of our finest garden Roses have come from their nursery, and this variety is likely to add to their reputation.

Aimee Cochet, a very promising hybrid Tea from Messrs. Soupert and Notting, colour flesh, with a rosy peach centre, flowers large and full and with a good point. It is a good grower and one of the best of this well-known firm's recent introductions.

Alberic Barbier.—This was well shown by Messrs. Turner at Holland House and the Temple, and is one of the wichuriana hybrids. It is a very strong grower, with dark foliage, contrasting well with its creamy white (deepening to yellow in centre), flowers semi-double.

Auguste Barbier is also excellent, possibly to be preferred to the last. It is free blooming and its semi-double flowers are produced in panicles; the colour is rosy lilac.

Jersey Beauty is becoming better known; it is still one of the best and will grow 20 feet in a season, palest yellow flowers and stamens.

Francois Foucard I saw growing well at Gunnersbury House recently. It struck me as an excellent variety, especially when I was told it was also an autumn bloomer; pale yellow in colour.

Paul Transom has a strong tea perfume, and is quite distinct, with the well known characteristic dark green foliage, flowers in panicles of good size, and its rose-coloured flowers are larger than usual and double.

René André is one of the prettiest, but the growth not quite so vigorous as some of the others, its flowers are semi-double, saffron yellow, the buds being sometimes a deep orange-red.

The last mentioned six Roses are all wichuriana hybrids, and make a charming set. Their price will be quite reasonable in the autumn, and everyone should grow them; they make good standards, but are at their best on steep banks, where they can ramble at will.

Arethusa.—A new China Rose that promises well, deep yellow in colour, tinted with apricot. A free flowering hybrid China. From Messrs. William Paul of Cheshunt.

Blush Rambler.—A new seedling Polyantha climber that I think very highly of. I am not at all sure that it is not the best seedling that has so far been put on the market. It is an excellent grower, very sweetly scented (a quality which few of the Ramblers have). Its truss is very large, and the flowers have room to develop, so that it does not get that too

crowded appearance that is a common fault. Its flowers are nearly single, of Apple blossom colouring, and altogether it can be highly recommended. It was raised by Messrs. B. R. Cant and Sons of Colchester, and plants from the open ground will be ready in November.

Chameleon.—Another of Messrs. William Paul's "Riviera" Roses, rosy flesh colour, with a fine deep-coloured outer petal, sometimes almost crimson on the buds. It has been well shown by the raisers, and will make a useful bedder. Another of the same class from the same growers is

Corallina.—Introduced in 1900, but I mention it here as it is an excellent bedder, very pretty in the bud, deep rosy crimson in colour, and good in the autumn.

Climbing Caroline Testout.—If all the plants of this Rose are as good as the specimen I have seen we have got something worth having here. Unfortunately, there is a tendency to revert back to the type amongst the climbing sports. This Rose needs no description; it was sent out last year by M. Chauvy.

Conrad Strassheim.—Sent out as a Hybrid Tea, but it has more of the appearance of a Tea, and is best described as a brighter Souvenir d'un Ami. The colour is rose, reverse of petals carmine, nice long bud. Distinctly promising.

Conrad F. Meyer.—One of the earliest of all Roses and at the same time one of the most vigorous growers. It would make a fine hedge. Messrs. George Paul and Son of Cheshunt had a fine bunch of it in their first prize stand of R. rugosa at the Holland House show. I believe we are indebted to Mr. James Hudson, of Gunnersbury House, for introducing this Rose to this country. It has all the good points of the best of the rugosas with the colour of Mme. Gabriel Luizet.

Comtesse Sophy Torby.—A fine large flower. When I saw it last autumn it had bright coppery orange flowers with deep pink centres, but I was told that in the summer it was almost peach-red with deeper coloured centres. It is tea-scented and a good grower.

Dainty.—Another "Riviera" Rose from William Paul's. It is pale primrose in colour, with a deeper yellow centre, sometimes edged carmine, flowers medium size, neat and compact, produced in clusters that are light; in a word, this Rose is well named.

Dorothy Perkins.—Now too well known to need description.

Ellen Willmott.—A Rose I have not seen growing, but a bloom of it in Messrs. George Paul and Son's stand at Sutton show this year struck me as being something that was wanted. A Hybrid Tea, nearly white, of good shape and substance. I cannot find it in any catalogue, so presume it is new. Shall be glad to hear more of this Rose.

Field Marshal.—A climbing China Rose (semperflorens) crimson in colour, of the shade of the old Cramoisie Superieure, but the shape and size is an improvement on that old friend. A good Rose that has received an award of merit from the Royal Horticultural Society.

Frau Peter Lambert.—This Rose promises very well. It has been well exhibited in the show box, but I think its right place is with this section. It is very free flowering, deep rose, shaded salmon, a pink Kaiserin A. Victoria.

Goldelse, another sport from K. A. Victoria, good colour golden yellow, but the flowers are not so full as those of its parents. Good grower and hardy.

Irish Brightness, Irish Pride, and Irish Star.—These three Roses are all singles, the first a Hybrid Tea and the other two pure

Teas; they are all three beautiful as shown by the raisers, Messrs. Dickson and Sons, who peak very highly of them. I liked Irish Pride, but the others I have not seen.

Lady Battersea.—Too good to be omitted, although now well known; it is very charming in the bud. Messrs. George Paul and Son till continue to give us beautiful Roses.

Lady Roberts.—This gem amongst English-raised Roses has become as popular as was generally anticipated when it was first exhibited by the raisers, Messrs. Frank Cant and Co., of Rochester, two years ago. I saw a very pretty bud of it growing in the shade (that is, protected from the midday sun) and the colour was superb, especially of the younger flowers. No grower of new Roses should leave this Rose untried.

Leonie Lamesch.—Not new exactly, but sufficiently good to be mentioned, unique colouring, brightest copper red. This charming little polyantha should be more grown.

Mme. Antoine Mari.—This Rose has been very highly spoken of. It is Tea-scented, rose splashed white, handsome buds which open well, growth vigorous; it has been awarded medals on the Continent. From the grower whose name it bears, as also is

Mme. Vermorel, which is very fine, colour rose with coppery yellow centre shaded red, large buds on long stems, also a Tea.

Mme. Charles Monnier.—A semi-climbing Hybrid Tea from Pernet Ducher that promised very well when I saw it in the Braiswick Nursery of Messrs. Frank Cant and Co. The flowers are rosy flesh, yellow centre, of large size, full and globular.

Marie Louise Poiret.—A cross between Caroline Testout and Marquise Litta that I like very much. It is like both parents—that is, the colour rose shaded deeper in the centre, and it has been well exhibited this year. Introduced in 1900 by Messrs. Soupert and Notting, must not be confounded with

Marguerite Poiret, introduced by the same firm only last year. This is also a good Rose, bright china pink, with yellow reflex, flowers large, full, and shape good. Very pretty in the bud.

Mark Twain.—An American Rose of some promise. Its raiser states that it is better than Mrs. W. J. Grant or Belle Seibright, as it is called "across the pond"; but the blooms and plants I have seen so far do not bear out that statement. Still, it is an excellent flower, and perhaps a better grower.

Marquise Jeanne de la Chataigneraye.—It is perhaps as well that this Rose does not promise so much of account. What a handicap—thirty-one letters only! Colour silvery white, yellow centre.

Mercedes.—A pale pink rugosa, almost the old maiden's blush colour—that is, distinct and very pretty. I do not know who introduced it, but it is a great improvement on many of the rugosas which are grown.

Morning Glow.—Another of William Paul's Roses; it is a grand colour—bright crimson suffused orange, with good petals; can be recommended.

Prince de Bulgarie.—This I also referred to in my notes on show Roses, but it should not be omitted from this section; it is one of Pernet Ducher's best, and that is saying a great deal.

Peace.—A pale yellow sport from G. Nabonnand, and doubtless, like its parent, at its best in autumn. Not too good a grower.

Queen of Sweden.—I like this Rose very much; it was raised by George Paul, of Cheshunt, and well shown at the Temple May show. It is quite distinct, and will be found

useful; its colour is very variable, sometimes salmon, fawn-white like Antoine Rivoire, and then a flower will come almost orange, and occasionally pink. Messrs. Paul recommend it for pot culture.

Rugosa repens alba.—Another Rose from this old-established firm of Rose growers that was awarded the gold medal at Holland House. It is a grower of great vigour and makes an ideal weeping standard—the parent plant at Cheshunt covers 100 square feet of ground. It is undoubtedly a cross with wichuriana that, I believe, came by chance in the nursery. It combines the best features of both its parents.

Salmonea and *Sulphurea*.—Two Roses that can be thoroughly recommended as bedders. Excellent as all these Riviera Roses are in the autumn, their names are descriptive of the respective colours, the first-named being particularly attractive.

Senateur Belle is a Hybrid Tea, salmon-pink with yellow centre, outer petals splashed carmine. I think it will be worth growing; the flowers are large and globular.

Souvenir de Jean Ketten.—Another Hybrid Tea, good in every way. Colour rosy carmine, shaded crimson. The buds are long, opening into large perfect flowers, a good grower, and altogether one of the best of the new H.T.'s.

Souvenir de Pierre

Notting.—From Messrs. Soupert and Notting. We all hope it will prove a yellow Maman Cochet. Some very fine flowers have been exhibited. It is one of the best new Teas, and will be largely grown by exhibitors.

The Wallflower.—An excellent Rose for a hedge, a lighter coloured Crimson Rambler, flowering in a similar fashion; it is one of Messrs. Paul's Cheshunt Roses.

Tea Rambler.—Its flowers are produced freely and in clusters, and are sweet-scented. For a summer flowering Rose it lasts a long time in flower. The colour is deep coppery pink, changing to soft salmon-pink, and during the process some curious effects are seen. A correspondent writing to me says:—"I like the new Tea Rambler, the flower is pretty, but looks sometimes as if a Strawberry had sat on it and leaked a bit." This also comes from Cheshunt.

Una.—Another Cheshunt Rose, a cross between the Dog Rose and Gloire de Dijon,

or one of its near relatives. There is a fine bed of this Rose at Kew. Buds are yellow, changing to creamy white on opening, of large size, quite (when well grown) 3 inches or 4 inches in diameter; nearly single; makes a fine hedge; altogether to be recommended.

Waltham Rambler.—A new Rambler after the style of Leuchstern, paler in colour, but more vigorous in growth; very pleasing, and well shown by Messrs. William Paul at the May Temple show; fine large panicles of flowers.

HERBERT E. MOLYNEUX.

Brantwood, Balham, S.W.

NOTES ON HARDY PLANTS

HARDY PLANTS IN FLOWER AT KEW.

GENTIANA LUTEA.

ONE of the most striking plants in the herbaceous ground at Kew is *Gentiana lutea*. It is growing in one of the borders there in ordinary good garden soil, and during late June and early July was at its best. The leaves are large, broadly ovate, forming a rather dense tuft some 12 inches to

GENTIANA LUTEA IN THE HERBACEOUS GROUND IN THE ROYAL GARDENS, KEW.

18 inches high. The flowering stems, which are from 3 feet to 4 feet high, have numerous large leaf-bracts oppositely arranged. In the axils of these the yellow flowers are very freely produced in bunches. When at its best this Gentian is a striking and effective plant. The growths usually flower when two years old.

CHAMÆLIRIUM CAROLINIANUM.

This is a North American plant that appears to be quite at home on the north side of the Kew rock garden, growing in light soil and a somewhat moist situation. As the illustration of it will show, it is extremely effective when in flower. It is of tufted habit of growth and spreads fairly rapidly, so that to obtain a good plant is only a question of one or two seasons' culture. The leaves are broadly lanceolate, and the tufts which they form not more than 3 inches or 4 inches high. The flower-spikes, bearing towards the top a great quantity of small white flowers, are from 18 inches to 24 inches high, and a good plant will produce several. Late June and early July are also the times of year at which this plant is at its best. Those who can give it the conditions mentioned above should not fail to add it to their collections.

SAXIFRAGA LINGULATA VAR. LANTOSCANA.

In some works of reference *S. lantoscana* is given the rank of a species, but in the "Kew

Hand List" it is now classed as a variety of *S. lingulata*. It is a handsome plant, bearing slightly drooping racemes, and the flowers so arranged on both sides of the rachis or stalk as almost to present a flat surface. It is not at all difficult of culture if given a position freely exposed to the sun and a well-drained soil. There is a variety *superba* of more robust habit, and bearing arching racemes of white, crimson spotted flowers. June is the month during which *S. l. lantoscana* and the variety *superba* are at their best. The former may be increased by division.

TREES AND SHRUBS.

CUPRESSUS LAWSONIANA AND SOME OF ITS VARIETIES.

THE Lawson Cypress, though introduced to this country only about fifty years ago, is now one of our most common conifers, while in point of numbers its named varieties equal those of any other hardy tree or shrub. It is one of the most variable of plants; this can be seen in a bed of seedlings where all types from the thin, upright form to the spreading, semi-pendulous habit of the typical plant can be found. In its native

habitat of Northern California and Oregon *C. lawsoniana* forms a tall, elongated, pyramid-shaped tree, reaching 100 feet or more in height, with short, horizontal branches which are semi-pendulous at the ends. In this country it will probably in course of time reach to practically the same height, as its growth is vigorous, and it seems quite at home in nearly every part of the country. In several places it has already become half naturalised, as seedlings have been found in considerable numbers near large trees, and seem to thrive and do well. Its bright, glaucous green foliage and graceful habit render it conspicuous wherever planted, and this is enhanced every spring by the bright crimson male catkins which appear in considerable numbers near the ends of the branches. A closer inspection at the same time will show the tiny cones near the catkins, they ripen and shed their seeds, nearly all of which are good in the first year. It is a diffi-

cult matter to make a selection from the numerous varieties, but those most worthy of growing are represented by the following:—

Var. albo-spica.—This is of close-growing habit with the ends of the shoots tipped with silvery white. It is a handsome plant, especially in the spring, but is rather slow of growth and a bad plant to move when it has attained any size.

Var. Alumi.—This is a vigorous, upright conifer, with flattened branches of a bright glaucous tint. It is a form that gets better the bigger it grows, being rather of a thin habit in a young state.

Var. argentea.—This has nearly the habit of the type, being perhaps more compact and less pendulous at the extremities of the branches. There is, however, considerable variation in the forms met with under this name. The plant is vigorous in growth, and has a whitish glaucous tint, which is very attractive at all seasons. Vars. *glauca*, *Silver Queen*, and *Triomphe de Boskoop* are of much the same habit, but differ somewhat in their degree of glaucousness. The latter is considered by some to be one of the "bluest" conifers we have.

Var. erecta viridis.—This is a well known but considerably over-rated form, with upright flattened branches of a bright grass green colour. The arrangements of the branches, however, springing as they do from near the base of the plant, is very much against its use as a large specimen, as snow, or even heavy rains, will break the plant open by bending the branches; from this they rarely properly recover. In a small state it is a useful plant for decorative purposes.

Var. Fraseri.—This resembles var. *Alumi* in habit, but is not so glaucous.

Var. gracilis.—This is a form of globose habit with slender branchlets pendulous at the ends. It is of a pleasing green colour, which is good throughout the year, and makes a capital small specimen, but takes many years to attain any size. There are also vars. *gracilis argentea*, *gracillima*, and *gracilis pendula*, but the true *gracilis* is the best for general planting.

Var. intertexta.—This is a tall growing, spreading form, with rather coarse foliage and semi-pendulous habit. It is a strong, robust plant, which quickly attains a considerable size.

Var. lutea.—This is of a uniform bright yellow colour, which is conspicuous throughout the year. It is of strong constitution—an important point with coloured conifers—and soon attains specimen size. In a small state it is a difficult plant to move with safety, but is better when it has attained a height of 2 feet or 3 feet.

Var. patula.—This is of a pyramidal, compact habit, and dark green, shining foliage. The branches are flattened, and spread out fanwise towards the extremities. It is of strong growth.

Var. Smithii.—This is a glaucous green form of upright, pillar-like habit, being the same diameter at the top as it is at the bottom. The foliage is fine and much divided, and the whole plant is very distinct and graceful.

Var. stricta.—This is a slender, upright plant, with dark green foliage, and somewhat resembles var. *erecta viridis* in outline, but the short branches spring from a central trunk, and rarely, if ever, suffer from snow or high winds.

Var. versicolor.—As its name implies, this is of a mingled green and gold colour. It has a vigorous, spreading habit, but the spotty effect it produces is not likely ever to render it very popular.

Var. Westermanni.—This is a form with

CHAMÆLIRIUM CAROLINIANUM AT KEW.

bright golden yellow shoots and wood, the colour of the former being mainly towards the ends. It is of a spreading, semi-pendulous habit, and soon makes a fair-sized plant.

There are many more varieties, some of which may be considered equal to those I have mentioned, but enough have been named to be a guide to those who want a selection of garden plants and not a collection of varieties. One form, C. l. var. *densa* or *nana*, is worthy of notice, as it is a dwarf, close-growing plant, suitable for the rockery, taking many years to attain a height of about 3 feet. J. C.

PHILADELPHUS MANTEAU D'HERMINE.

THIS pretty little shrub is now in flower, and is one of the best of the set which we owe to M. Lemoine in crossing *P. coronarius* with *P. microphyllus*, the first of which was the now well-known *P. Lemoinei*. The one under consideration has double flowers of the purest white, each flower perfect in shape, and very freely produced on the slender, twiggy stems. It makes a small shrub 2 feet to 3 feet in height, and is much benefited by the cutting away of the older wood when flowering is past. The flowers are very sweetly scented, and are useful for indoor decoration, the scent not being so strong as to be objectionable, as is the case with the majority of the Mock Oranges.

Bagshot, Surrey.

J. CLARK.

NOTES FROM SWANS- WICK.

PLANTING MOISTURE-LOVING FLOWERS.

It is hard to imagine a more uncanny little plant, as far as appearances go, than *Pinguicula lusitanica*. It is more like a few pale yellow fish scales doubled up together than anything else, that is, during that stage of its being to which mine have at present attained. I have been planting a tiny bog round a sort of big flower-pot saucer with this and the minute *Pinguicula vulgaris*, which also has a pallid and anæmic air about its wee rosettes, and little clumps of *Sentiana verna*. I have been trying to reproduce in miniature the exquisite wet peat meadows near Munich, so vividly described by a correspondent of THE GARDEN some time ago, and to this end intend immediately to add *P. arinosa*. The plan of sinking a porous, shallow, terra-cotta pan, and planting in peaty loam and sand round it, keeping it full of water all the summer and spring, seems to answer so well for *Primula rosea grandiflora*, a planting of which is doing grandly thus created, that I hope the three little things mentioned above may also succeed. I find it far better to do all my planting of small choice alpine, &c., in summer. While they are in full growth, and especially just after flowering, they seem to take to a fresh place at once, and the only trouble is in keeping them carefully watered, which, of course, is a necessity. But if I plant much in autumn the unestablished roots rot in our hen cold, damp, and heavy soil, that seems to affect them even though they may be in special compost; mists, vapour, and exhalations, I suppose, rise from it all round them. If, again, I plant in spring, the parching and bitter winds we always get now give them such a check as is not easy to outgrow.

But all the alpine I have turned out of pots—of course I am speaking of those grown in pots for his purpose—from about May 25 onwards, in his and former years, have invariably gone on well where they were properly attended with water. It would be different, of course, in a very

dry garden. I have no doubt whatever that Mr. Pearson is quite right in his correction of my misstatement as regards

DELPHINIUM BELLADONNA.

I said in my haste that some of the plants I put in last autumn were seedlings, but if the plant is sterile of course they could not have been; the explanation is that I bought young plants, nice healthy young plants too, and did not stay to consider whether or not they were what they looked like. I suppose, as it cannot be propagated thus, that accounts for its weakness of constitution. It is such an exquisite thing, and one never seems to get the exact shade in the ordinary *Delphiniums*, although I have a very good range of blues, from the darkest to the palest, in seedlings of these now flowering for the first time, the strong soil suiting them well. As for the *Lithospermum*, I believe the crux of the matter, so far as mine are concerned, lies in those three pregnant words of Mr. Pearson's, "On the level." The only two potsful of this lovely gem that have ever lived with me have been two planted thus casually, and after the careful arrangement

La Czarine, a good cropper, bright red, some very large berries of elongated shape, with markedly polished smooth shoulders, irregular in size, sweet, excellent flavour.

White Pine, difficult to pick, as it is impossible to judge accurately of its ripeness, a white or faint blush in colour, pink seeds, small round berries, all one size, prolific bearer, most delicious flavour.

Ananas Perpetuel, a failure, no crop, shy, small, and of no merit in taste.

Michigan, a large, coarse, knobby berry, dull in colour, no flavour, and a poor crop.

Leon XIII.—Very like *St. Joseph*, but not so good, less prolific, small bright red berries, sweet and soft. Of course the merits of this latter with the other perpetuals cannot be properly assayed until the end of the summer, but even if a soft, woolly, tasteless Strawberry does bear for months together. It is not much good, as everyone is soon tired of it.

SCHIZOCODON SOLDANELLOIDES,

on first acquaintance, is rather a hopeless-looking plant. It is like a few little half-dry bits of dark

SAXIFRAGA LINGULATA VAR. LANTOSCANA AT KEW.

of the rest which ended so dismally had been made. Last August we planted some experimental rows of

STRAWBERRIES,

the testing whereof has been a matter of interest. The runners came from France, were very strong and good, and went ahead well from the first. Perhaps it is needless to say that Royal Sovereign, previously in possession, came out an easy first, but one or two of the others we think worth preserving.

The summary, according to our experience, is as follows: All ripened together, within a few days, and picking began on June 26. Soil, a good loam over clay, well trenched.

Goliath.—This is the Strawberry originally raised in Bath by Mr. Kitley. Large berries, irregular in shape, good bright red, no special flavour, and a trifle sour. A poor crop.

Brandyvine (an American berry).—Small, prolific bearer, good colour, no flavour, rather sharp. This should be an excellent jam Strawberry.

The well-known *St. Joseph*, allowed, as it should not be, to ripen its first setting, had very prettily shaped and coloured berries, small, very sweet, and deliciously flavoured, all one size. A large crop.

red Barberry leaf, the same leathery crackling texture. I am making a little colony of *Shortia galacifolia* and *uniflora*, *Galax aphylla*, and the first-named, and certainly a reputation for being hard to grow, is justified by such an appearance on introduction. The sweetly pretty bright blue-lilac flowers of *Haberlea rhodopensis*, more like *Streptocarpus* than the *Gloxinia*, to which they are generally compared, are most attractive, but the plant is evidently terribly sensitive to the slightest drought. Even one hot day without watering, although it is well tucked into a shady rock recess with a big stone keeping the sun off it, caused it to curl its corrugated leaves inwards instead of letting them lie in the normal flat rosette, and look quite withered, a condition to give the grower with a shock of terror lest it should be gone for ever.

If once the middle of its hairy rosette, like those of the *Ramondias*, gets full of soil it is most difficult to clear it out, and when I make another planting of things of this kind I shall be more careful, as they seem to dislike having foreign substance lodged between and about the younger leaves, and yet to be unable to get rid of it.

CONANDRON RAMONDIODES

which lives with them and shares the same affection for a shady, moist rock face, is much more manageable, as having leaves that, though they are much the same shape and also arranged rosette wise, are smooth and not hairy, and convex instead of concave. I find it is good to have alpine, &c., which like the same sort of treatment together, as these all can be watered at one time and labour is saved; also, as someone lately remarked, they do better where the soil bulk is of one nature than where they only have an oasis of, say, sandy peat and loam, in a surround of something else. I saw that M. Correvon remarked of one or two of the Primulas that they like the company of their own species and will not grow in an isolated position; this suggestion opened my eyes to the fact, which I think undoubted, that there are many other delicate plants of the same way of thinking. Even among my few alpine this is most plainly observable. The *Glossocoomias*, for example, which are quite easy to grow here, and do well on the rockery and on the level border beside a path, grow appreciably faster when two or three are planted together than when one is alone. What a lovely thing *G. ovata* (*Codonopsis ovata*) is! The bell, so large for the size of the plant, is very pretty when you look at it from above and only see its plain delicacy of grey-mauve colouring. But when it is reversed, and you look inside, what a revelation of rich colour and exquisite markings! The first flower comes out at the top of the stem, then another lower down: rarely more than one at a time on a stalk. It is a very tender-looking little plant, but nevertheless, after dying quite down each winter, comes up with quiet persistence and several sizes larger with every returning spring. I have not seen the green-flowered form in blossom, though I now have it in the garden, but I am told, and can easily believe, that it is not nearly so attractive as the other. I have one clump of *G. ovata* in sandy loam on the level in full sun, and two on the partly shaded side of a rockery about 18 inches from the ground in a level pocket of sandy peat and loam; all three are equally healthy, so it cannot be such a difficult plant to grow as is sometimes supposed. I daresay it would hate smoke or any townish contaminations of the air, as its delicate, faintly tomentose leaves would soon suffer. How very much more useful from a decorative point of view are the

OLD CLOVE AND THE MARGUERITE AND GRENADIN CARNATIONS,

in their varieties, than the choice border Carnation from layers. Here I have masses of good-sized flowers in different shades of rose and scarlet, intensely floriferous, and most charmingly bright and gay, the result of a sowing of *C. Grenadin* seed last year.

Very few of the plants turned out singles, and the flowers are of good size; of course all are fringed. They have been in flower since the middle of June, while the first *Clove* Carnation came out the second day of July, and both will continue for months. Not one border Carnation is showing colour yet (July 5), though they are going to be plentiful in blossom, and they will be all over long before the crimson *Cloves*, which last year were still blooming at the end of November, and were only spoiled by the excessive wet.

THE WHITE EARLY GLADIOLI THE BRIDE

are very lovely just now. Some of them are among dwarf bush *Roses*, where their lemon-tinged whiteness is exquisitely framed by young copper-tinted shoots and the *Tea* blossoms in their delicate shades.

THE WICHURAIANA ROSES, though quite young and still small, are extremely promising for another year. *May Queen*, a bright crimson double, very like *Cramoisie Supérieure* in flower and colour, is, to my mind, infinitely superior to any other I possess. The undecided yellowish pink of *René André* is, of course, the kind of thing that is fashionable and continually being aimed at just now, but colours like this are wonderfully set

THE BEAUTIFUL ORCHIS LATIFOLIA IN THE BOG GARDEN AT KEW.

ORCHIS LATIFOLIA.

OF our native Orchids this is the most vigorous and, on the whole, the most striking, and, moreover, one that usually does well under garden culture. The plant shown in the accompanying illustration is growing in that portion of the Kew rock garden devoted to bog plants. The leaves are large and handsome, being heavily blotched with purple-brown, while vigorous plants will produce flower-stems from 2 feet to 3 feet high, the flowers being produced in the axils of small leafy bracts, which are numerous upon the stem. *Orchis latifolia* delights in a cool and fairly shady position and moist soil. Nowhere have we seen it finer when growing wild than in one of the most inaccessible parts of Burnham Beeches, in a spot shut in by trees where the sun could rarely penetrate, on the bank of a small stream. The soil in such a spot consists almost wholly of decayed leaves (of the Beech largely), so that an excellent idea of its requirements may easily be had. They have been successfully provided at Kew, and are almost identical with those under which *O. latifolia* grows wild, except that the Kew plant enjoys more sunlight. H. T.

AN ARTIST'S NOTE-BOOK.

CAMPANULA PEREGRINA

ONE of the most interesting plants before the floral committee of the Royal Horticultural Society recently was this biennial *Campanula*, which was shown by Messrs. J. Veitch and Sons of Chelsea, and given an award of merit. It will make a welcome flower for the conservatory. The flowers are bell-shaped, pale blue to violet-blue in colour, the ovary being encircled, as also the base of the corolla, with deepest violet-blue. They are arranged in a dense spicate raceme 2½ feet high. The plant is much branched from the base, thus enhancing its decorative value. The species, however, is a very old one. These free-growing *Campanulas* are of the greatest value in the conservatory, and *C. peregrina* is so in particular. It is exceptionally free.

ROUND ABOUT A GARDEN.

THE MUSIC OF JULY.

JULY is described as the silent month; and, indeed, the chorus of thrush and blackbird has fallen all to pieces. You can now walk among the shrubberies in early morning without that buoyant feeling that you are taking part in the full choral service of Nature. Throughout the sunlit day, too, the skylark orchestra is now so thin and fitful that you actually notice

off by having a good glowing crimson *Rose* somewhere at hand to show them up; such, at least, is my heresy.

Pink Roamer, so often recommended, is a nice bright pink, not, however, without a faint suspicion of magenta at first, but it goes off to a most horrible dull exaggeration of the latter unpleasant hue, in which state it is far from pleasing.

The good deep rose-pink of *Anne of Geirstein*, the Hybrid Briar, glows like jewels behind an 18-inch high mass of some *Geranium*, whose name I have lost and forgotten, whose large flowers are of the most brilliant and perfect shade of violet-blue. The combination sounds rather painful, but in reality is glorious.

Swanswick Cottage, Bath.

M. L. W.

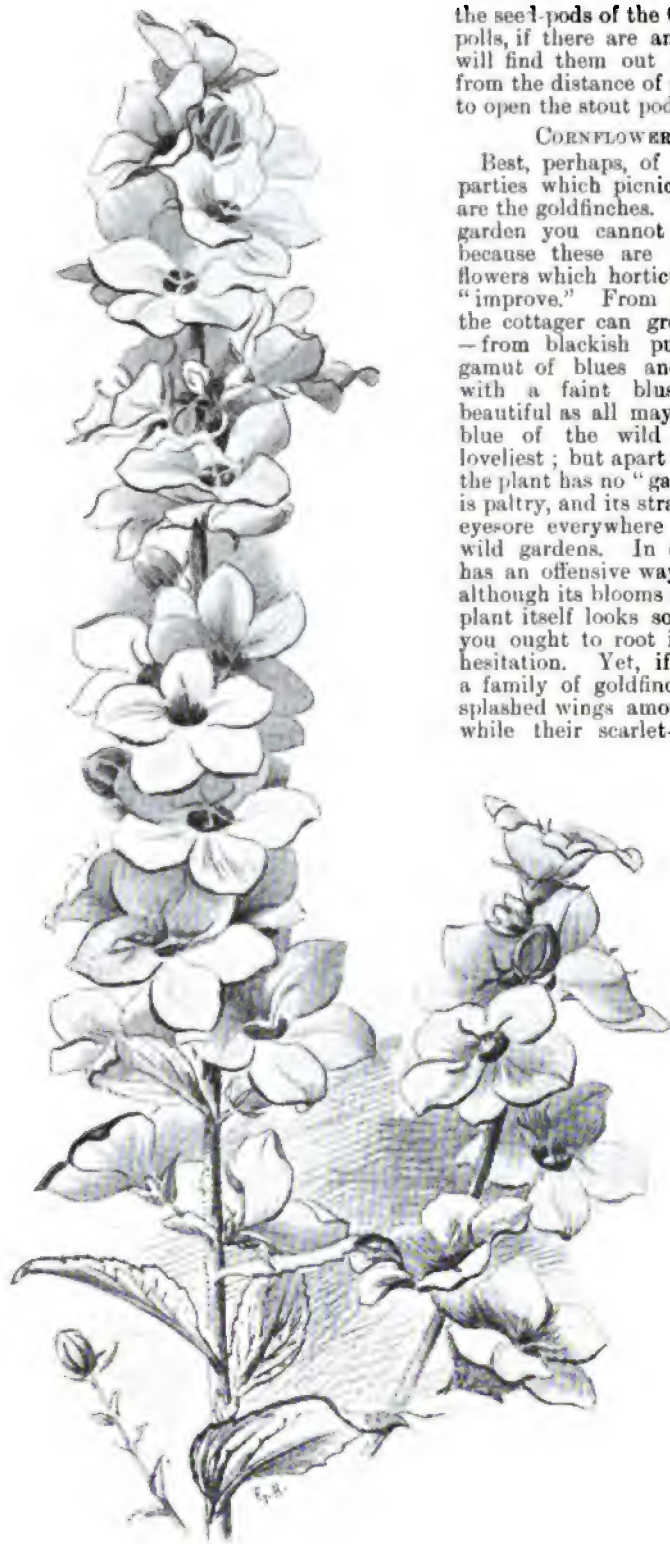

when a skylark is singing. Last month the whole sky vibrated with song, and you walked under it unconcerned. But the two greatest gaps in late summer's programme of music are caused by the departure of the cuckoo for foreign parts and the silence of the nightingale. Not that the nightingale is actually silent. From his point of view he probably has more to say, and says it oftener in July than in May. He says it to wider audiences, too, because so soon as the young nightingales are fairly fledged they are escorted round the country from spinnery to shrubbery, and from shrubbery to coppice by their noisy parents. In this wandering we see no doubt the first stirring of the instinct which culminates in overseas migration; but the music to which the nightingales march with their families is very different from the liquid melodies which they poured out round their nesting sites in spring. "Kruk-kruk," says a deep harsh voice in the shrubbery. "Kruk-kruk," a little further off. "Kruk-kruk," a little nearer. Watching, you catch sight of three or four bright russet-coloured small birds, obediently trooping after that croaking voice. It is a family of nightingales being personally conducted by their parents round the neighbourhood.

VOICES OF SUMMER.

But, though the nightingale has exchanged his cornet-flute for a sort of foghorn, and both the ballad-singing blackbird and the thrush *improvisateur* are seldom audible, except when they chatter out of a bush before you or raise a persistent outcry because some wandering cat or weasel is near their brood, there is music enough in the garden. The confident carol of the robin and the twisting trill of the hedge-sparrow suggest, perhaps, uncomfortable thoughts of coming winter in the new prominence which their simple songs assume; but the music of the wren carries on the traditions of spring, and in the notes of yellow-hammer and cirl bunting we hear the same iteration of the continued presence of summer as shrills in the grasshopper's music. The very heat haze which shimmers over the meadows seems to vibrate to the yellow-hammer's tune, which he repeats four times to the minute from the top of the garden hedge. Nor have all of our summer visitors in mid-July followed the example of nightingale or cuckoo. The white throat still fills himself up into the air out of an evergreen and sings a quavering song as he descends. The sedge warbler still jangles musically from the shrubbery's recesses, and the swallows, house martins, and swifts are noisier now than ever with their broods launched in the mazy whirl of life, all twittering and screaming with the joy of it.

BIRDS AND WEEDS.

At every turn the nursery noise of birds reminds you that the breeding season has trebled the feathered life that finds a temporary home inside your garden fence. You never suspected a bullfinch's nest in that Crimson Rambler on the trellis, but the soft notes of bullfinch conversation surround you now on every side. The gardener has some remarks to make, too, about the family of hawfinches which visit the Green Peas in the very early morning before he gets to work, and the resonant "chew-chew-chew" of young greenfinches seems to fill every corner of the kitchen garden. More musical, with their alternate high and low call-notes, are the families of linnets, and very handsome are the fathers in their ruddy waistcoats and pale-barred wings. But to have many linnets in your garden, even in districts where linnets

CAMPANULA PEREGRINA. Just over half natural size.)

are so numerous as to surprise the London visitor—who sees "cage-birds" in every hedge—you must have lots of weeds in seed, and it is not everyone who sighs to see a great Sow-thistle that had smuggled itself among the Sweet Peas uprooted, because he thinks how many linnets might have visited that weed. Where redpolls breed, too, you may be sure of hearing their deep, distinctive twitter wherever the Sow-thistle is found, and if in some "knuckle end" of your garden you can allow

the seed-pods of the Godetia to ripen, the redpolls, if there are any in the neighbourhood, will find them out and let you watch them from the distance of a few feet as they labour to open the stout pods.

CORNFLOWER AND GOLDFINCH.

Best, perhaps, of all the uninvited family parties which picnic in your garden in July, are the goldfinches. If you have a very formal garden you cannot grow blue Cornflowers, because these are common, straggling wild flowers which horticulture has not managed to "improve." From a penny packet of seed the cottager can grow them of every shade—from blackish purple, through the whole gamut of blues and pinks, to pure white, with a faint blush in the centre; but, beautiful as all may be, the original heaven's blue of the wild Cornflower remains the loveliest; but apart from this charm of colour the plant has no "garden" virtues. Its foliage is paltry, and its straggling habit makes it an eyesore everywhere except in the wildest of wild gardens. In dry seasons, moreover, it has an offensive way of crinkling up, so that, although its blooms are beautiful as ever, the plant itself looks so manifestly diseased that you ought to root it up without a moment's hesitation. Yet, if you have ever watched a family of goldfinches, fluttering with gold-splashed wings among the azure Cornflowers, while their scarlet-crowned parents taught

them how to cling to the yielding stalks and extract the seeds while hanging head downwards, you will be very loth to part with a single Cornflower. And the worst of it is that the more untidy and "seedy" the Cornflowers become, the more attractive they are to the goldfinches. This, however—like the Godetia seeds and the redpolls or the Sow-thistles and the linnets—is only another instance of the difficulty of keeping a tidy garden if you are fond of birds, unless the garden is large enough for you to make a "bird corner" in it.

THE PARTRIDGE QUESTION.

Just now the bird problem of my own garden is partridges. It recurs every year, and in much the same shape. This year there were eighteen eggs in a cunning nest under a young Austrian Pine in the shrubbery and seventeen chicks were hatched. Of these, one has died, because I counted only sixteen crossing the path from the Cabbages to the Raspberries a day or two ago. The gardener objects on principle to "nigh a score of birds" clucking and pecking among his vegetables, though he grudgingly defers to my assertion that young partridges only eat insects, and are, therefore, welcome guests in a garden. If they would not subsequently always choose seed-beds for

their dust-baths and pick up the seeds scattered during the operation, this argument might hold good to the end; but it always ends in a tacit compromise that the gardener may "shoo" the partridges out of the vegetables and even throw clods at them, so long as he is careful not to hit them, provided that they are unmolested when they walk about the lawns or the shrubberies. They soon learn that if they are hunted out of one part of the garden they may remain in another, and when the annual partridge drives take place in winter we have our reward. The countryside around may be re-echoing with the volley-firing of crack shots, piling up their score of so many hundred brace killed before lunch, but our garden will be full of the crowing and clucking of partridges, who knew where they would be safe when the noise began. They are scarcely as big as sparrows yet and cannot fly over a Cabbage, but in December they will be glad to come whirring over the Pine trees into sanctuary. E. K. R.

GARDENING OF THE WEEK.

INDOOR GARDEN.

AMARYLLISES now ripening up their growth in cool, airy pits or houses should not be prematurely deprived of water at the root so long as the foliage continues green, but keep the soil in the pots slightly moist, and during hot, bright weather a shading of light tiffany will protect the foliage from the fierce rays of the sun and allow it to complete its proper functions. Nerines, which are more advanced in the ripening process than the former, should be exposed to the full sun in cool, well ventilated pits, and as the foliage becomes exhausted and dies off moisture must be entirely withheld and the pots stored away in a dry shed or room.

CINERARIAS.

Young seedling plants established in 3-inch pots should be potted on before the pots become full of roots, otherwise they will receive a check, and those previously pricked out in boxes should now be potted singly in 3-inch or 4-inch size, according to the strength of the plants. These should all be placed in a cold frame in a shady position, or reverse the position of the frame and give it a northern aspect. Keep the atmosphere moist and shade the plants whenever the sun is powerful.

PRIMULA SINENSIS.

Young plants require a slightly warmer and drier atmosphere than the Cinerarias, and should be potted in a compost of one-third each of loam, leaf-soil, and peat made sufficiently porous by the addition of sand and broken charcoal. The earlier plants should now be ready for 5-inch pots, and after the potting should be placed in a frame near the glass and given a shading of tiffany on all bright days. Watering should be attended to carefully, and must not at any time be given in excess. The ventilation also requires close attention to keep the plants sturdy and compact, for if kept too close they quickly become drawn, and are apt to fall about in the pot.

TREE CARNATIONS.

Old plants of these in 6-inch or 7-inch pots from which the summer crop of flowers has been out may now be potted into pots one size larger, and grown on for next season. Where a cold house can be given them it is to be preferred to placing these plants out of doors. During the summer they require a light shade, and the house must be occasionally damped.

HUMEA ELEGANS.

As soon as ripened seeds of this season's growth can be obtained make a sowing for next year's display. Use small, shallow pans well drained and filled with equal parts of light loam and decayed leaf-soil, with a free addition of sand,

pressed moderately firm and watered before sowing. Cover the seeds very slightly and place a sheet of glass over the pan, which may then be placed on a shelf in a shady position in a somewhat close house or pit. In either position attend carefully to the condition of moisture of the soil or the seeds will not germinate freely.

CELSIA ARCTURUS.

As soon as the young seedling plants are big enough to handle prick them off to three round the side of a 3-inch pot, and in this way grow them on till they get into 6-inch or 8-inch pots, in which they will make a fine display during the early months of the year.

Wendover.

J. JAKUES.

FRUIT GARDEN.

MELONS.

PLANTS in pits and frames swelling off fruit will now take an abundance of water at the roots. During unfavourable, cold, wet seasons it is not advisable to water overhead in these structures, where the plants are more subject to canker than when grown in houses, and spider does not make so much headway; but advantage may be taken of a fine afternoon for flooding the bed with water at a temperature of 85° to 90° without wetting the foliage, and closing about half-past three, when the atmospheric moisture will produce conditions highly favourable to the rapid development of the fruit. Pay particular attention to the preservation of the old leaves, as they cannot be interfered with without producing a check, and give them full exposure to sun and light by cutting away all lateral growths and keeping the glass clean. Elevate the fruits on inverted pots, on a level with, but not above, the foliage, as some varieties are liable to become discoloured when they change for ripening if night airing is neglected. Attend well to the linings by turning and renovating with fresh manure before the heat in the beds shows signs of declining, cover with good dry mats, and give a chink of night air to prevent an accumulation of rank steam and condensation of moisture on the fruit. Get out young plants before they become pot-bound, and make a good sowing of some quick-fruited sort for coming in October.

CUCUMBERS.

If a heated compartment, perhaps now filled with Melons, will be at liberty in about three weeks, the present time will be favourable for sowing a few seeds of Telegraph or some other favourite variety for autumn fruiting. Be careful to cleanse the house thoroughly. Also prepare the necessary material for giving bottom-heat. Have it well worked before it is taken in, and defer plunging the fruiting pots or making the ridges until all danger of burning the soil has passed away. Make frequent additions of light, rich turf to the roots of plants which have been in bearing for some time, feed copiously with clean liquid, and water occasionally with warm clarified lime water to keep the hills free from worms.

CUCUMBERS IN FRAMES.

These are now in full bearing, and will require unremitting attention if they are to be kept in good order for any length of time. Dress them over three times a week and earth up with rich turf and old lime rubble as the roots find their way to the surface. Attend to the linings, as want of bottom-heat is often the forerunner of canker and mildew on plants in frames that have been started well and afterwards neglected. When the oldest plants show signs of exhaustion cut out all the fruit and old leaves, peg the plants down on the hills, pack the joints with pieces of fresh turf, and keep the frame close, moist, and shaded until new growth sets in.

Madresfield Court.

WILLIAM CRUMP.

THE KITCHEN GARDEN.

ENDIVE.

MAKE frequent sowings, plant out when large enough in rich soil, and keep well watered both with clear water and liquid manure. This is one

of those salad plants that should be accorded liberal treatment so that large, well blanched heads may be had in the quickest possible time; no bolting will then take place.

There are various methods adopted in blanching, viz., by tying when the leaves are dry, by placing inverted flower pots over them, and by laying a clean, dry roofing-tile upon each plant when about three parts grown. I prefer the latter mode for the curled variety, whilst the tying up process answers well for the Batavian.

GLOBE ARTICHOKE.

These are very late in producing heads this season, owing to the severe and continued check the plants received in May and June. Cut the stems down as the heads are cut, and apply a heavy mulch and frequent copious waterings. By so doing fleshy heads may be cut for a long period and the plants will be strengthened for another year. Having regard to the tenderness of this esculent there can be no doubt that it is a good practice to annually lift some strong side shoots in autumn and pot them up. Keep them in a cold house or pit, and plant out at the end of April; especially is this method recommended where the soil is stiff and cold and other conditions of the district are uncongenial.

PEAS.

The mid-season and late crops are looking healthy and robust in this district, and if not already done the surface should be mulched for the double purpose of conserving moisture and affording nutriment. Any check they receive at this time through becoming dry at the roots or impoverished will tend to bring on an attack of mildew and the ultimate diminution of the crop. It frequently happens that the haulm falls outwards from the supporting sticks, hence it is necessary to pass a string of cocoanut fibre down the entire length of the row, passing it round Bean-poles inserted firmly in the ground at intervals of about 10 feet to keep it tight. This operation should be repeated as growth proceeds.

TOMATOES FOR WINTER.

Sow seed or insert strong cuttings of varieties that are known to answer for winter fruiting. Winter Beauty is one of the best. Raise them in cool quarters and grow sturdily throughout. To ensure this avoid the use of fire-heat until cold weather sets in, and do not feed the plants. Pot on firmly as required, using a compost mainly of loam, adding sufficient nodules of charcoal and road grit to make the whole porous. Ten-inch pots will be large enough for fruiting the plants in.

ASPARAGUS BEDS.

Keep these free from weeds and treat liberally at this time in order that the plants may recuperate for another year. By ceasing to cut somewhat earlier than usual, and by feeding occasionally with salt, soot, and artificial manure, the growths now are exceptionally robust.

H. T. MARTIN.

Stoneleigh Abbey Gardens.

FLOWER GARDEN.

CARNATIONS.

THE Carnation and Picotee are best propagated by layers, and this important work should now have attention. The operation in itself is very simple, and very easily learnt by those who are so disposed. The operator should provide himself with a good kneeling pad, a sharp knife, and a pair of sharp scissors. Remove the leaves which ensheath each layer up to the third or fourth joint, counting from the top. This removal is generally effected with a slight horizontal rift, but where the layer is very succulent a pair of sharp scissors should be used. The plant being thus prepared, remove any dead leaves and a little of the old soil, and place the compost, previously prepared, round the plant. Take the layer firmly between the left forefinger and thumb and thrust the point of the knife through the third or fourth joint, as the layer may be more or less matured; band the layer until the joint just cut freely opens, press gently into the soil, and peg firmly. I have found from experience

that pegs made from the tops of Pea sticks answer best for this purpose. Galvanised wire is largely used, but this is liable to rust, and, if overlooked when removing the layers, may occasion the disruption and destruction of them. When layering is finished water lightly with the fine-roset pot. Should sparrows and other birds be troublesome when removing the soil from the newly-layered plants, sprinkle a little soot over the soil occasionally; this will help to keep them at bay.

FERN-LIKE PLANTS FOR THE FLOWER GARDEN.

However much we may appreciate Ferns in the plant houses, we have yet but rarely employed them in the flower garden, and there are many obstacles which are likely to prevent their use there. We have only to look among herbaceous plants to find many things with all the grace of a Fern and yet will withstand the sun as well as a Toadflax. *Thalictrum minus*, although growing freely in ordinary soil in the full sun and being perfectly hardy and permanent, is almost as attractive as *Adiantum cuneatum*. *T. adiantifolium* is a very interesting plant; the foliage is very pretty and most suitable for cutting. *T. aquilegifolium* is a fine border plant, with yellowish flowers and handsome foliage.

PRIMROSES AND POLYANTHUSES.

Those who wish to save seed of any special varieties of these must now keep a watchful eye on them, the former especially, as in sunny aspects it is very probable that the pods from the earliest flowers that have, as is the rule, curled down beneath the leafage have burst and perhaps shed their seed. A few days of warm dry weather serve to ripen seed of this description very rapidly. Seed should be sown immediately after it is gathered or it will grow with vigour if kept till the following spring. If sown now a bed of finely-pulverised soil in the open air will answer to perfection.

Ashwellthorpe Hall Gardens, Norwich.

SUPPORTING MELON FRUITS.

WHEN the Melon is growing under natural conditions it is a prostrate plant, and the fruit immediately it is formed finds a secure resting place on the ground, so that the stem of the plant at no time suffers from supporting its own weight. It is very different in the case of this fruit when grown under glass or trellis suspended from the roof. The question then becomes an important one as to which is the most effective method of helping the plant to bear the great weight of the crop it often carries. Amateurs and beginners are often puzzled in this matter, as from time to time many and varied contrivances are recommended. One or two facts should be borne in mind relative to this aspect of successful Melon growing, as they unquestionably have a certain bearing and influence on the success of the crop.

The first is that the support should be given before the fruit becomes heavy enough to bend and distress the shoot on which it is grown, that is, as soon as it is the size of a pigeon's egg. If left unsupported too long the tissues of the shoots become disturbed and damaged, unfitting them afterwards to develop and bring the fruit to perfection. The second important point to notice is to see that the resting parts of the support are well distributed under the base of the fruit, for if undue pressure is exercised at any one point at this and subsequent stages of the fruit's growth, the surface of the Melon may be disfigured by the line of contact being impressed permanently on it. So tender is the skin of the Melon at this stage of its growth that the least scratch will leave an indelible mark.

One noted grower years ago used to be credited with the practice of netting his Melons according to his taste and fancy by scratching the surface when young with a needle. As the fruit developed, so of course did the markings, presenting a pretty picture or not when ripe, according to the talent of the artist. I mention this to show the importance of providing supports which give a well-balanced support to the fruit.

Many growers are satisfied with tying the fruits under the trellis with a strong piece of matting passed crossways under the fruit. In the hands of capable growers this method answers very well; but there is always a danger of the matting shifting and the fruit falling, or of the decay of the matting, and so let the fruit drop. Another way preferred by many is to have pieces of board 5 inches square, and suspend the same under the fruit, fastening them by strings from each corner of the board to the trellis, and boring a hole in the middle to pass away moisture which may collect and settle on the former. This method gives steady and effective support to the fruit; but the objection to it is that the base of the fruit receives

A GOOD METHOD OF SUPPORTING MELONS.

its whole weight during growth, and often, in consequence of the moist atmosphere caused by syringing and evaporation, the boards are more or less damp always, causing many of the fruits to split and give way at the base before ripening. The method now most generally adopted and which we recommend is the one illustrated—namely, supporting by small nets specially made for the purpose. These are easily fixed, and the support is evenly distributed, with no undue pressure on any particular point, and there is no danger of the fruit falling. The only precaution to take under this method is to prevent the possibility of marking the surface of the fruit, and this can be done by occasionally hoisting the net, so that the strong markings are not always on the same part of the surface. OWEN THOMAS.

A large Cucumber.—Mr. E. L. L. Thornycroft writes from Thornycroft Hall, Sidington, Crewe: "My gardener brought me in recently a Cucumber, of which he was very proud. It weighed 3lb. 11oz., was 29 inches long, and 8½ inches round; it was Dickson's Excelaior."

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

CYTISUS ANDREANUS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I sympathise very much with Mr. Burrell in his disappointment in connexion with the planting of this very pretty and, I still think, very easily cultivated Broom, as described on page 437 of the last volume. I have found it quite at home in soils and under circumstances in which *Prunus pissardi* is found to do well. Were the plants which so failed such as are sometimes supplied by the trade grafted on the roots or stems of young seedling Laburnums? If so, the cause of failure would seem very obvious. Such plants rarely, if ever, give satisfaction; they generally, indeed, flower freely for a season or two, but soon become stunted and sickly, and die off after a few years. I would therefore advise Mr. Burrell to

procure a fresh stock, taking care that the plants are on their own roots—whether produced from cuttings or layers, or even seedlings—as, happily, from 20 to 30 per cent. of these are found to come true, and may easily be tested before they are planted out in their permanent quarters. H. F.

THE DOUBLE CRIMSON SWEET WILLIAM (DIANTHUS BARBATUS MAGNIFICUS).

[TO THE EDITOR OF "THE GARDEN."]

SIR,—“R. P.” in speaking of this plant says: “There is no doubt as to its being difficult to keep,” a statement requiring a little modification so far as my own experience goes. I have always found that in light, very sandy, much drained soils, it is certainly difficult to keep, while in the more holding and clayey soils the plant is one of the most easy to deal with of my acquaintance. This is not the result of a single experience, but in gardens and localities as far removed as Buckinghamshire, Birmingham, Gloucestershire, Cheshire, &c., where heavy soils have obtained, the plant

grew and increased most freely. On light soils as at Tooting and in this (Hampton) district it requires special care and attention, and even then is without much of the vigour of those grown in the more heavy soils. It may be in these colder and more tenacious soils there is a something very near akin to the "cool damp soils of Scotland," and it is in this the plant delights. In a Gloucestershire garden I once made an edging of it, and was amazed at its success and the way the plant grew from the base. In this district, to which repeatedly plants have been transferred from the above, the plant refused to develop. Obviously on the more holding soils the plant is a success, and on the reputedly light and warm soils can scarcely be comforted at all. I strongly advise those who garden on heavy soils to try it and report results.

Hampton Hill.

E. JENKINS.

BEDDING PANSIES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I observe Mr. John Fleming, when gardener at Cliveden, is credited with the popularising of the Tufted Pansy, or bedding Viola. In a certain sense that is true, because he largely employed in the huge beds at Cliveden the old Cliveden Blue, Purple, and White. But these were not of the strain of the Tufted Pansies of to-day. They were bedding Pansies of a very diverse race. It was not till some time later that the wordy war between the late John Willr and Mr. Edward Bennett broke out over the great progenitor of the Tufted Pansy, Viola cornuta, or that farther discussion as to the origin of its progeny, Viola Perfection, began. Then came many others, one of the most popular and widely grown being Blue Bell, raised as a chance seedling in Mr. R. Dean's garden at Ealing thirty years ago, and yet seen in many gardens, while myriads of others since raised and acclaimed have disappeared. John Fleming had, I think, passed away long before the Tufted Pansy of to-day had become what it is. If some varieties have been worthless very many have proved to be valuable additions to our flower gardens.

A. D.

MUSCAT VINES FAILING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I am sending some Vine leaves for your inspection. Can you please say the cause of the yellow spots or markings on the leaves which eventually turn brown? The Vines until about three weeks ago looked in perfect health. They are grown in a raised bed which is wholly inside, and are about six years old. I have dug down into the border and find it in perfect condition as to moisture, and in doing so came across some fine healthy roots. I shall be pleased if you can suggest any remedy. I may mention that in among the Muscates, near the middle of the house, is a Lady Downes' Vine, which was planted by mistake. Instead of taking it out I put on a dormant bud of the Muscat last spring, which made a splendid cane by the end of the season. It is now carrying several good bunches, and, strange to say, this Vine is, with the exception of two or three leaves, free from the trouble in question. The Vines are growing in a span vinery running north and south, and it is the east side that is the worst affected, those on the west side are older canes, but are affected in places.

Yorks.

G. T.

[Our correspondent has placed before us very clearly a case of diseased Muscat Vine leaves, which one seldom hears of but often sees—namely, yellow spots on the leaves and margins, eventually causing the tissues affected to turn brown and wither away. This affection is certainly not caused by red spider, neither can we trace any indication of a fungoid attack. We think that somewhat might be thrown on the subject by submitting specimens of the affected leaves to the scientific committee of the Royal Horticultural Society.

We had an experience very similar to our correspondent's a few years ago, and we traced the trouble to be due to over-cropping the Vines while young. The Muscat in its early stages of life grows

rampantly, and if permitted will carry a heavy crop without injury for three or four years. There are very few cultivators who will not gratify their vanity by occasionally growing sensationally heavy crops, unconsciously ignoring the fact that Nature abused will have her revenge, inevitably causing disappointment and failure in after years. This is especially so in the case of the Muscat of Alexandria, as its constitution is not naturally so strong and vigorous as the majority of Vines. The foliage especially is thin, making it an easy victim to insects and various diseases. In our case the Vines had been planted five or six years in a raised inside border, and had succeeded remarkably well for the first few years, finishing off heavy crops of excellent Grapes. However, towards the end of June and early in July in the fifth year the Vines became affected in the same way as our correspondent's, and we feared a total collapse; however, by considerably reducing the crop, by the encouragement of lateral growth, by light shading with herring nets, and repeated soakings of clear lime water, we succeeded in ripening the Grapes perfectly. In the winter we thoroughly examined the border and found abundance of roots and came to the conclusion that by heavy cropping and copious waterings the comparatively limited soil of the border had been so impoverished, or the fertilising elements were insoluble owing to the absence of lime in the soil, that the Vines were starving. In late autumn we had as much of the soil removed as possible without disturbing the roots too much, adding to the new turf some $\frac{1}{2}$ -inch bones, a sprinkling of bone-dust, old mortar and lime rubble, not forgetting a liberal addition of quicklime. This treatment effected a complete cure, and we have not had a recurrence of the trouble since. Our case may not have been on parallel lines with our correspondent's, but we offer him our experience for what it is worth. This is a complaint of frequent occurrence with Muscat Vines, and we invite correspondence from our readers interested in the subject.—Ed.]

HYBRID WATER LILIES FAILING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Some four years ago I planted several Nymphaeas in an oval pond some 70 feet to 80 feet long by about 45 feet wide. The water is from 2 feet to 4 feet deep in winter, and 1 foot to 3 feet in summer, and chiefly supplied by rain. A few plants came up and flowered. The second year I planted some more. Still fewer came up and flowered. The third year I planted more, and none came up. Last May I again planted, and none appeared. I may mention all the Lilies were planted about May in each year in wicker baskets, in good loam, and all the Lilies were of the newer sorts. I may also mention the pond has been during the last three years, and still is, rather thickly covered with Duckweed.

Essex.

R. T. S.

[We sympathise with our correspondent, and consider after his successive attempts at growing these beautiful Lilies, that if he has not succeeded in commanding success he has certainly deserved to succeed. He seems to have observed and carried out all the details essential to success as regards soil and planting, &c. Yet, in our opinion, it is not difficult to point to the cause of failure, and this is expressed in the last sentence of our correspondent's statement—namely, "that the pond was rather thickly covered with Duckweed, and has been so for three years." From our experience of water covered by this weed in summer, we have no hesitation in saying that it is hopeless to expect to succeed with these Lilies while the water is in this condition. Nymphaeas love warmth, and in proportion to the warmth of the water in summer will be the measure of their success. As long as this weed is permitted to form a coating on the surface of the water, it is quite impossible for the sun's rays to penetrate. If the temperature of this covered water were taken—say 6 inches to 12 inches under the surface—and compared with water from weed, and open to the sun's influence, a difference in temperature would be found of not less than from 6° to 8° in favour of the latter.

Our correspondent, after clearing away the Duckweed, and subsequently keeping the surface of the water clear, will in future doubtless succeed with the culture. There are many ways of clearing the water of this weed—the most common way is by scooping it off with a fine sieve fastened to a pole. A man entering the water would soon clear the area mentioned, and by repeating the operation occasionally the water would be kept clear. In America, we believe, the surface of ornamental waters is kept free from weeds by spraying with Bordeaux mixture. The mixture is used in a diluted and weak state, and is found to kill the weeds in a few days. We have had no experience with this remedy ourselves, but it might be tried upon a yard or two of the water first, and, if successful, its application could be soon extended.—Ed.]

EXTENSION OF HAMPSTEAD HEATH.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Your notice about the extension of Hampstead Heath showed your sympathy with the movement, and therefore you will, perhaps, allow me to add the names of the officers of the council and my address, to which offers of donations can be sent. The Right Hon. G. J. Shaw Lefevre is the President, the Earl of Meath is the Vice-President, Sir Robert Hunter and Mr. E. Bond, M.P., are joint treasurers, the Bankers of the Fund are the London and South-Western, Limited, 28, High Street, Hampstead, and Lloyd's Bank, Limited, Rosslyn Hill, Hampstead, and I am honorary secretary. Our first council meeting was held on June 26, but already nearly £7,562 has been promised, besides £3,000 conditionally offered; but that sum is a long way below the total of £48,000 that is needed.

It behoves, therefore, all who care to preserve the beauty and freshness of Hampstead Heath to send their gifts or promise *without delay*; and if any will bestir themselves to interest others, I shall be glad to send a paper giving full details, with a map, a picture of the Heath and the fields, subscription forms, and any other information that is required. It is delightful to those of us who know the lives of town workers, the stress and pain of heat, and crowds and noise, to think that the Tube will soon bring swiftly and cheaply hundreds and thousands of them out to the clean air and verdant loveliness which the Heath affords. But unless the eighty acres of the neighbouring fields are secured, the large numbers will destroy the beauty they go to seek, and the streets of small houses that it is proposed to build will spoil the far-famed view, and defile the bright high air with smoke.

It is not as one who sometimes rests in a cottage in Hampstead, but as one who often works in Whitechapel, and knows the conditions of the thousands of people who live in places where flowers will not grow, that I tell of this need to the public-spirited of your readers who care to give to impersonal causes.

HENRIETTA O. BARNETT,

Hon. Sec. of the Hampstead Heath Extension Council.

BOOKS.

The Wild Garden.—We welcome a new edition of this excellent book, which may be accepted as the standard authority on the delightful subject of gardening in the wild. In the preface to the new edition the author writes: "The best thing I have learnt from my own wild gardening is that we may grow without care many lovely early bulbs in the turf of meadows, i.e., fields mown for hay, without in the least interfering with the use of the fields. The blue Anemones, Crocus, Snowdrops, Narcissus, Snowflakes, Grape Hyacinths, Dog's-tooth Violets, Stars of Bethlehem, Fritillaries, St. Bruno's Lily, Snow-glories, wild Hyacinths, Scilla, and wild Tulips, best fitted for this early gardening in the meadow turf, wither before the hay is ready for

* "The Wild Garden," by William Robinson (Murray). Price 10s. 6d. New edition.

ODONTOGLOSSUM CRISPUM GRAIREANUM. (Natural size.)

the scythe, and we do not find a trace of the leaves of many of them at hay time. Many of the plants of the mountains of central Europe and also of those of what we call the south and east, such as those of Greece and Asia Minor, bloom with me earlier than our own field or woodland flowers. Our feebler sun awakes them in the mowless fields, and so we enjoy many spring flowers while our grass is brown. And if they come so early in the cool and high 'forest range' in Sussex, they will be no less early in the warm soils, as in Surrey or in the many valley soils, sheltered as they often are by groves and banks of evergreens. As nearly every country house is set in meadows, it is easy to see what a gain this is, not only for its beauty but because it lets us make an end of the repeated digging up of the flower for the sake of a few annual and other spring flowers—themselves to be removed just in the loveliest summer days." This is the keynote to the book, which describes the way the finer native plants from other lands should be introduced in the wild and rougher places in the woodland, in the home grounds, and the many lovely things that may be grouped and naturalised in ditch, lane, copse, hedgerow, brookside, water, and bog. It tells of the beauty of grassy woodland walk and paths, and gives helpful lists of those things which the planter should take as his guide. Another grateful feature of the book is that it is illustrated with wood illustrations, made chiefly from drawings by Alfred Parsons. This edition of the "Wild Garden" is the outcome of the author's ripe experience. Twenty years have gone by since the first edition appeared, and throughout that time he has experimented in the home grounds and woodland, with the result that the present volume is as complete and useful as a long experience can make it. The chapter "Some Results," by Mr. William Brockbank, is full of suggestions, and appeared originally in THE GARDEN. That devoted to "Hardy Exotic Flowering Plants for the Wild Garden" is one of the most helpful in the book, and is a guide to the soils required by the various things described. Here is a note about Mulgedium Plumieri, which was sent a few days ago for our table: "A plant of distinct port, with purplish blue blossoms. Till recently it was generally seen in botanic gardens only, but it has many merits as a wild garden plant and for groups in quiet green corners of pleasure grounds or shrubberies. It does best in rather rich ground, and in such will pay all who plant it, being a hardy and long-lived perennial. The foliage is sometimes over a yard long, and the flower-stems over 6 feet high in good soil."

Addenda to Sanders' Orchid Guide, 1901-3.—It is necessary in these days when hybrids are being raised with surprising freedom for supplements to be issued with a standard guide at certain intervals. We therefore

welcome this addenda to Sanders' excellent work. The new tables of hybrids consist of those crosses raised and recorded since the guide appeared, and every care has been taken to verify the records. We agree with the authors when they state that "we believe these and the preceding tables will be found to be an essential guide in every Orchid collection, particularly as a glance at them will help to avoid the too prevalent duplication and synonymy existing in the present nomenclature of hybrids." It is interesting to notice that *Cypripediums* and *Cattleyas* fill the greatest number of pages.

ODONTOGLOSSUM CRISPUM GRAIREANUM.

THERE have been shown lately many finely spotted forms of *Odontoglossum crispum*, and although a few were quite distinct in form of flower, colour, size, shape, and disposition of the markings, many very closely resembled each other. The flower change from the plethora of those whose only claim to notoriety lay in the heavy blotches and spots with which they were marked. Instead of these characters, the petals and sepals are suffused all over with a delightful blending of red, brown, orange, and purple, the first-named colour prevailing towards the centre of the flower. Sepals, petals, and lip have white margins, and splashes of white show here and there through the ground colouring. Norman C. Cookson, Esq. (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne, exhibited this new *Odontoglossum* at the Temple show on May 26, 27, 28, and it then received a first-class certificate.

AGAPANTHUS INSIGNIS.

RECENTLY flowering in the nursery of Messrs. William Bull and Sons of Chelsea was this striking *Agapanthus*. Though assigned specific rank it is more than probable that it will be classed by botanists as a variety of the old and popular *Agapanthus umbellatus*. However, from the ordinary form it differs in several well-marked particulars. The flower scape of the specimen shown was much taller than is usually seen, while the foliage is also distinct, the basal portion of the leaf being marked in the centre with a creamy tint. The most striking feature of all is, however, the head of blossoms, for the individual flowers are far more numerous than in any other form, added to which they are borne on longer pedicels, so that the

first expanded blooms droop, and, the centre being filled by the later ones, the entire inflorescence is more spherical than in the type. The colour is a shade of pale lavender, but if the plant were grown outdoors the tint probably would be somewhat deeper. This *Agapanthus* was introduced from South Africa.

SOCIETIES.

THE NATIONAL ROSE SOCIETY AT GLASGOW.

THE visit of the National Rose Society to Glasgow on the 15th inst. is the second occasion the Rosarians of the south have crossed the Border, they having visited Edinburgh many years ago when, in connexion with the summer exhibition of the Royal Caledonian Society, a National Rose Show was held in the spacious Waverley Market. The St. Andrew's Hall, in which the present exhibition was held, though the finest building of the kind in the North is, mainly on account of deficiency of light, ill adapted to flower showing, at least one-fifth of the blooms on Wednesday week being set in a kind of twilight, and as the weather was typical of Glasgow—"aye raining"—not one tiny blink of sunshine appeared to lighten the gloom. However, the Roses themselves were in such glorious form that they compensated for any drawbacks in connexion with their surroundings. Those competent to judge declared this to be the Rose show of the year, and quite equal to any previously held under the auspices of the National Rose Society. It is unfortunate that the backwardness of Scottish Roses prevented such champions as Messrs. Croll, of Dundee, and Messrs. Cooker, Aberdeen, from showing, the only firm present with flowers being Mr. Robertson, Hellensburgh. The officials of the West of Scotland Rosarians Society, in conjunction with which association the National Rose Society held this provincial show, were, it is only courteous to say, most attentive in giving every facility for reporting. The arrangements on the whole were most commendable.

JUBILEE TROPHY.

Two handsome cups, with a not extravagantly large bonus in cash, one for nurserymen and the other for amateurs,

MESSRS BULL'S NEW AGAPANTHUS.

were productive of the finest blooms in the show. For the former the prize was for thirty-six blooms, distinct varieties, there being nine entries. Messrs. Harkness and Co., Hitchin, was easily first with a superb set of blooms, large, fresh, and in perfect colour. The varieties comprised Mildred Grant, Gustave Piganeau, Bessie Brown (extra fine), Ulrich Brunner, Papa Lambert (very fine), the same remark to Gladys Harkness, Her Majesty, and Marie Radey; Marie Baumann, Mme. Victor Verdier, Lady Mary Beauchamp (a lovely bloom), Mme. Charles Crapet, A. K. Williams, Maman Cochet (extra), Comtesse de Ludre, Kaiserin A. Victoria, Mme. Cusin, Souvenir d'Elise, Prince Arthur (a fine bloom), White Maman Cochet, Fisher Holmes, Ellen Drew (lovely in colour), Mrs. Cocker, Louis Van Houtte, Mrs. John Laing, Duke of Edinburgh, Killarney (lovely), Duke of Wellington, Marchioness of Downshire, Jean Souper, Mrs. Edward Mawley, Victor Hugo (in wonderful colour), Niphotos, and Ulster. There was some difficulty in determining to whom the second prize should be awarded, the fight between Messrs. B. R. Cant and Sons, The Old Rose Gardens, Colchester, and Messrs. A. Dickson and Sons, Limited, Newtownards, being keen and close. Finally the Irish Roses were declared the less good, the noted Colchester firm receiving the second award, and Messrs. Dickson third. The former staged Her Majesty, A. K. Williams, Maman Cochet, G. Piganeau, Caroline Testout, Mme. Marie Rodocanachi, Mildred Grant, Lady Moyra Beauchamp, Comtesse de Nadallac, Papa Lambert, Ulrich Brunner, Ben Cant (silver medal), White Maman Cochet, Abel Carrière, Mrs. J. Laing, Marie Baumann, Frau Karl Druschki, F. Michelson, Maréchal Niel, Duke of Edinburgh, Mme. Cusin, Dupuy Jamin, Bessie Brown, Duchess of Portland, Fisher Holmes, Jean Ducher, Duchess of Morny, Mrs. Cocker, Black Prince, Marchioness of Londonderry, Maurice Bernardin, Medea, Reynolds Hole, Killarney, and Horace Vernet.

The amateurs' cup was offered for twenty-four blooms, distinct varieties, Mr. E. B. Lindell, Bearton, Hitchin, securing the coveted prize with beautifully fresh and well-coloured blooms of the following: Mildred Grant, Prince Arthur, Her Majesty, Comte de Raimbaud, Duchess of Portland, Mme. Cusin, Marchioness of Londonderry, Dupuy Jamin, Charles Lefebvre, Frau Karl Druschki, A. K. Williams, Comtesse de Nadallac, Horace Pernet, Muriel Grahame, Victor Hugo (a grand bloom to which the silver medal was awarded), Her Majesty, Robert Scott (extra fine), Alfred Colomb, White Maman Cochet (extra), Marie Baumann, Maman Cochet, G. Piganeau, Bessie Brown, and Mrs. J. Laing. Mr. Conway Jones, Gloucester, secured second prize, and Mr. Henry Machin, Gateford Hill, Worktop, third.

NURSERYMEN.

Rose growers are like other classes of the community, intensely human, and in the class for forty-eight blooms, distinct varieties, we find an illustration of the trait in the fact that Messrs. Dickson and Sons, Limited, Newtownards, reserved their best blooms for this class and beat Messrs. Harkness, who placed their choicest in the cup class, which, as already noted, they had no difficulty in securing. Messrs. A. Dickson's premier, forty-eight blooms, distinct varieties, were not only choice, but among them were many names not to be found in other collections. The sorts were M. Verdier, Frau Karl Druschki, Tom Wood, Mme. Cadeau Ramey, Franchon Michelot, Lady Ciammorris, Duchess of Morny, Mrs. E. C. Sharnan Crawford, Xavier Olibo, Mrs. David McKie (a cream tinted bloom to which a gold medal was awarded), Captain Hayward, Her Majesty, Marie Baumann, Florence Pemberton, Alphonse Souper, Bessie Brown, Helen Keller, Susanne Marie Rodocanachi, Marchioness Dufferin, Minister Cream Seedling, G. Piganeau, White Maman Cochet, Comte de Raimbaud, Alice Graham, Louis van Houtte, Alice Lindell, Horace Vernet, Marie Radey, Robert Scott (extra), Gladys Harkness, Duchess of Portland, Marquise Jeanne de la Chataigneraie, Earl of Dufferin, Grand, Mildred Grant, Ulster, Caroline Testout, Ulrich Brunner, Mme. Jules Grangerveine, Heinrich Schnitzels, Edouard Strassheim, Duke of Fife, Mrs. Edward Mawley, Annie Wood, William Shean (deep plush seedling), and Helen Guillot; second, Messrs. Harkness and Co., A. K. Williams, Robert Scott, Beauty of Waltham, Victor Hugo, and Susanne Marie Rodocanachi being especially noteworthy; Messrs. D. Prior and Sons, Colchester, were third.

For twenty-four trebles, Messrs. R. Harkness and Co. secured first with a magnificent lot of blooms of lovely colouring. They comprised Edward Piganeau, Mme. Cadeau Ramey, Duchess of Morny, Caroline Testout, Marie Baumann, Mildred Grant, Gladys Harkness, Alfred Colomb, Lady M. Beauchamp, Mme. Crapet, Her Majesty, Ethel Brownlow, Fisher Holmes, Frau Karl Druschki, Mme. Cusin, and White Maman Cochet; Messrs. A. Dickson and Sons, Limited, were a good second with fine blooms; and the Hereford Nursery Company third.

For thirty-six blooms, distinct varieties, Messrs. Townsend and Son, Worcester, were first, staging good examples of Ulster (grand bloom), Mrs. J. Laing, Caroline Testout, Helen Keller, Her Majesty, Bessie Brown, A. K. Williams, White Lady, Susanne Marie Rodocanachi, Frau Karl Druschki, Marquis of Lansdowne, G. Piganeau, Mrs. W. J. Grant, Marchioness of Londonderry, Catherine Mermet, Captain Hayward, Jeannie Dickson, Victor Verdier, Marchioness of Downshire, Duke of Wellington, Crown Prince, Kaiserin A. Victoria, Beauty of Waltham, Robert Duncan, White Maman Cochet, La France de '89, Victor Hugo, Clio, Killarney, Magna Charta, Maman Cochet, Reynolds Hole, and Ulrich Brunner; Messrs. J. Jeffries and Son, Cirencester, were a capital second, and Mr. David Robertson, Helensburgh, third.

For sixteen trebles, Messrs. Townsend and Son were again first; Mr. George Prince, Longworth, second, with among other lovely examples of Comtesse de Nadallac, Muriel Grahame, Ernest Metz, E. V. Hermance, Bessie Brown, The Bride, Mrs. B. O. Sharnan Crawford, Mrs. E. Mawley, Bridesmaid, and Mildred Grant; Messrs. John Jeffries and Son, Cirencester, were third.

For eighteen blooms, distinct varieties, Teas and Noisettes, Mr. George Prince, Longworth, was awarded first, staging

grand and wonderfully coloured blooms. The varieties were White Maman Cochet, Ernest Metz, Comtesse de Nadallac, La Boule d'Or, Innocente Pirola, Maman Cochet, Mrs. E. Mawley, Medea (very fine), Bridesmaid, Souvenir de S. A. Prince, Souvenir d'un Ami, Golden Gate, Cornelia Koch, Muriel Grahame, Maréchal Niel, Miss Edith Brownlow, The Bride, and E. V. Hermance. Messrs. Frank Cant and Co., Colchester, were second—Mrs. R. Mawley, Francisca Kruger, and Etiole de Lyon being noteworthy blooms; third, Messrs. D. Prior and Sons, Colchester.

For twelve blooms, Teas and Noisettes, there were nine entries. Messrs. Townsend and Sons, Lower Broadheath, Worcester, being first; second, Mr. Hugh Dickson, Belfast; third, Mr. John Mattock, New Headington, Oxford.

OPEN.

Twelve blooms of new Roses, distinct varieties: First, Messrs. A. Dickson and Sons, Limited; second, Messrs. F. Cant and Co.; third, B. R. Cant and Sons.

Twelve white or yellow Roses (twelve entries): First, Messrs. A. Dickson and Sons, Limited, with grand Duchesse of Portland; second, Mr. Hugh Dickson, Belfast, with lovely blooms of Bessie Brown; third, Mr. George Prince.

Twelve blooms, light pink or rose coloured varieties: First, Mr. George Prince, with grand blooms of Mildred Grant; second, Messrs. F. Cant and Co., with same variety; third, Mr. Hugh Dickson, with Ulster.

Twelve blooms, light or dark crimson varieties: First, Messrs. B. R. Cant and Sons, with A. K. Williams; second, Messrs. Townsend and Son, with Roseiste Jacobs; third, Messrs. A. Dickson and Sons, Limited.

Twelve varieties, fives in vases. These, like the foregoing, were badly placed, but some grand flowers were shown. Mr. George Prince was first, with unnamed varieties; Messrs. A. Dickson and Sons, Limited, second; and Messrs. Townsend a close third.

The next class was for new seedling Roses, or distinct sports, three trusses, either not yet in commerce, or not distributed earlier than November, 1902. Mr. Hugh Dickson, Belfast, gold medal for Hugh Dickson, H.P.; card of commendation for J. B. Clark, H.T. Messrs. A. Dickson and Sons, Limited, Newtownards, gold medal for Mrs. David McKie; card of commendation for Dean Hole and Duchess of Westminster. Messrs. B. R. Cant and Sons, Colchester, gold medal for climbing Polyantha Blush Rambler.

For twelve Teas and Noisettes, distinct varieties (trebles), a grand class, Mr. George Prince was first; second, Messrs. F. Cant and Co.; third, Messrs. A. Dickson and Sons, Limited.

For eighteen distinct, garden, or decorative varieties, not less than three trusses of each (space 8 feet by 3 feet), there was only a slight competition. The first prize was awarded to Mr. John Mattock, New Headington, Oxford; Messrs. F. Cant and Co., second; and Messrs. Paul and Son, Cheshunt, third.

AMATEURS.

The trophy prizes have already been noted.

For thirty-six blooms, distinct varieties, the Rev. J. H. Pemberton, Havering-atte-Bower, was first, showing Tennyson, White Maman Cochet, Her Majesty, Mrs. R. F. Sharnan Crawford, Mrs. Mawley, Caroline Testout, Papa Lambert, and Frau Karl Druschki; second, Mr. E. B. Lindell, with very fresh blooms; third, Mr. Conway Jones, Gloucester.

For eight distinct varieties, three of each, Mr. E. B. Lindell stood first with a grand lot; second, Mr. H. Machin; third, Mr. Conway Jones.

For nine blooms, Teas and Noisettes excluded, Mr. R. Park, Bedale, was first; Mr. W. Boyes, 30, Duffield Road, Derby, second; and the Rev. J. H. Pemberton third.

GROWERS OF LESS THAN 2,000 ROSES.

The three immediately succeeding classes were confined to growers of less than 2,000 Roses.

For eighteen distinct varieties: First, Mr. R. Foley Hobbs; second, Mr. Edward Mawley; third, Mr. Whittle.

For six trebles: First, Mr. R. Foley Hobbs; second, Mr. Mahlon Whittle; third, Mr. E. Mawley.

For six blooms, Teas and Noisettes excluded: First, Mr. R. Foley Jones; second, Mr. Mawley.

OPEN TO GROWERS OF LESS THAN 1,000 PLANTS.

Twelve distinct varieties: First, Mr. R. L. Garnett, Myreside, Lancs; second, Mr. G. Moules, Hitchin; third, Mr. A. Gray, Jun., Helensburgh.

OPEN TO GROWERS OF LESS THAN 500 VARIETIES.

Six blooms, distinct varieties: First, Mr. H. Adamson, Bedale; second, Mr. W. Upton, Leicester; third, Nina Dickson, Newby Bridge.

OPEN TO ALL AMATEURS.

Six blooms of new Roses, distinct varieties: First, Mr. Conway Jones, with Alice Lindell, Robert Scott, Gladys Harkness, Mildred Grant, Lady Moyra Beauchamp, and Duchess of Portland; second, Mr. Mahlon Whittle; third, the Rev. J. H. Pemberton.

Twelve blooms, Teas and Noisettes: First, the Rev. F. R. Burnside, Great Stanbridge Rectory, Essex, with White Maman Cochet (also awarded silver medal for best bloom), Comtesse de Nadallac, La Boule d'Or, Maman Cochet, Edith Brownlow, The Bride, Mme. Cusin, Muriel Grahame, Golden Gate, Catherine Mermet, Medea, and Ernest Metz; second, Mr. Conway Jones. For nine blooms, the names for first and second are the same, Mr. Lindell securing third.

OPEN TO GROWERS OF LESS THAN 500 PLANTS.

For nine blooms, Teas and Noisettes: First, Mr. F. Foley Hobbs; second, Mr. M. Whittle.

OPEN TO GROWERS OF LESS THAN 200 PLANTS.

Six distinct varieties, Teas and Noisettes: First, Mr. W. Upton; second, Rev. R. I. Langtree, Grange-over-Sands; third, Mr. H. Adamson.

EXTRA CLASS OPEN TO ALL AMATEURS.

Six trebles, Teas and Noisettes: First, Rev. F. R. Burnside, with fine examples.

Twelve distinct varieties, garden or decorative Roses

(space occupied limited to 6 feet by 3 feet): Equal first, Rev. J. H. Pemberton and Mr. Edward Mawley.

CLASSES CONFINED TO LOCAL GROWERS.

Eighteen blooms, distinct varieties: First, Mr. Bonnet, Helensburgh; second, Mr. Russell, Newton Mearns; third, Mr. MacFarquhar, Helensburgh.

Twelve blooms, distinct varieties: First and silver medal, Mr. Black, Kingussie, Fife; second, Mr. Whyte, Helensburgh; third, Mr. Smith, Corrirop.

Six blooms, distinct varieties: First, Mr. Russell; second, Mr. W. K. Gair.

In addition to the silver medal Roses already mentioned Messrs. D. Prior and Sons secured one for White Maman Cochet; Mr. E. B. Lindell another for a glorious bloom of Victor Hugo. The King's Acre Nursery Company, Hereford, and Mr. Conway Jones medals for Mildred Grant.

Messrs. B. R. Cant, Colchester, staged masses of a new Polyantha, almost single, called Blush Rambler, and among miscellaneous exhibits may be mentioned a group of Carnations from Mr. Matthew Campbell, High Blantyre, and an extensive assortment of beautiful Fancies, Violas, Sweet Peas, and Pelargoniums, from Messrs. Dobble and Co., Rothsay.

FORM BY.

THIS successful exhibition was again held, by the kind permission of Mr. F. A. Rockliff in a field adjoining Brian Hey on the 15th inst., and it is pleasing to report in this trying season an undoubted improvement in all departments in the exhibits staged by gardeners, amateurs, and cottagers.

ROSES.

as usual, were the leading feature, and were not only good in quality but in greater quantity than hitherto. Mr. R. Kennedy, as usual, occupied a foremost position by securing three firsts, having beautiful blooms of La France, A. K. Williams, Mrs. Sharnan Crawford, Captain Hayward, Killarney, Bridesmaid, Maman Cochet, Medea, Mme. Cusin, and others. Mr. Luther Watts secured two firsts, and other exhibitors that led in the several classes were Miss M. A. Rimmer, Messrs. G. Lunt, T. Carlyle, T. Pugh, D. Lever, and J. H. Page. Mr. Carlyle gained the National Rose Society's silver medal for a medium-sized but charming bloom of Maman Cochet. Coming closely on the Rose is the favourite

SWEET PEA.

which is enhanced in interest by the silver bowl presented by Mr. H. Middlehurst. This brought about a dozen competitors. Mr. Dodd, Jun., last year's winner, again occupying the premier position with well cultivated flowers artistically arranged. Very good were Salopian, Duke of Westminster, Miss Willmott, Emily Eckford, Gorgeous, Lady Gird Hamilton, &c.

BEGONIAS.

were well staged by Mr. Luther Watts, who won for three single varieties and three doubles. Gloxinias were also pleasing feature supported generally with better grown stove and greenhouse plants, Fuchsias, Geraniums, and Ferns being especially good. Seven ladies made an excellent show in table decorations, bouquets, sprays, &c., showing taste and original designs.

Mr. W. Mackellar secured the leading award for a collection of good vegetables, the cottagers being of high merit in this department.

Amongst the numerous exhibits not for competition which gained an award of merit were Messrs. A. Dickson and Sons, Newtownards, for fine Bessie Brown and Mildred Grant Roses, about four dozen of each variety, and collection of well-grown Sweet Peas and herbaceous cut flowers: Mr. R. Wright, Ormakirk, Fancies and Violas; Mr. E. Middlehurst, Liverpool, choice collection of Sweet Peas; Messrs. T. Davis and Co., Wavertree, Liliums, Petunias, Lily of the Valley, Gladioli, and good vegetables; Messrs. Caldwell, Roses, Sweet Peas, and herbaceous cut flowers. Mr. T. Pugh, secretary, and Mr. E. H. Bushell, treasurer, ably carried out their respective duties.

HORTICULTURAL CLUB.

EXCURSION TO WINDSOR.

THE annual excursion of members of this club and their friends took place on Thursday, the 16th inst., and despite the somewhat unfavourable state of the weather was greatly enjoyed. The party, about eighty in number, met at Paddington terminus at 10 a.m., and proceeded in two saloon carriages to Windsor, where, thanks to the invaluable aid and management of Mr. Harry Veltch, who kindly undertook the arrangements, and the great courtesy of Mr. Nutt, the architect, Mr. Mackellar, the head gardener, and Mr. Tait, the farm steward, the castle, the grounds, and the splendid collection of cattle were all inspected in turn under the best of auspices. The club, thanks to special permission accorded by His Majesty, enjoyed the unusual privilege of visiting the private gardens, as well as those more generally open to inspection, and it need hardly be said were delighted, not only by their beautiful design and arrangement, but also by the perfection of the order in which they were kept. So great indeed was the pleasure that the fortunately transient showers and generally dull and threatening weather formed practically no bar to enjoyment. On arriving at Windsor some of the party decided to drive through and around the splendid park; the major number, however, deterred by the threatened downpour, elected to visit the interior of the castle, and although the state apartments were not available for inspection, they went through St. George's Chapel, the Memorial Chapel, and other adjuncts of the castle, which was greatly enhanced by the presence of Mr. Nutt, who very kindly acted as cicerone to the party, pointing out with the finger of an expert the special points of architectural and historical interest. To those who drove round the park the beauty of the scene was heightened rather than otherwise by the freshness imparted by the showers, the atmospheric effects on the long vistas of the avenues being charming. At one o'clock the

party lunched at Messrs. Layton's, and subsequently were conducted over the gardens by Mr. Mackellar, passing through the private ones aforesaid, and thence to the dairy, the kennels, and farm, finally reaching Frogmore. A capital tea had been arranged by special permission in one of the Royal conservatories, after which a couple of hours were spent in visiting the kitchen and other gardens, and eventually, under Mr. Tait's kind supervision, the pick of the prize cattle were paraded for the visitors' benefit, the party then being driven back to Windsor to dinner at Messrs. Layton's.

Mr. Harry Veitch presided, and after the toast of "The King" had been duly and gratefully honoured, the health of Messrs. Nutt, Mackellar, and Tait, the two latter gentlemen being present, was proposed and drunk with enthusiastic recognition of their kind contribution to the enjoyment of the day, the function closing after a few words from Mr. Hunt, a visitor from the Antipodes, with a similarly well-deserved recognition of Mr. Harry Veitch's highly successful efforts to make it a red-letter day in the annals of the club. The party then broke up, returning to London as they came, and unanimously declaring that had the weather been better they could not possibly have enjoyed themselves more.

CROYDON HORTICULTURAL SOCIETY.

TOMATO GROWING.

THAT most popular fruit the Tomato was the subject of a paper given before the members of this society at their rooms, George Street, on the 14th inst., and the mode of culture recommended by Mr. F. Oxtoby, Cooombe Lodge Gardens, found hearty appreciation from all present. Commencing with the early introduction of Tomatoes to this country, Mr. Oxtoby remarked it was only of recent years that this excellent has gained such prominence, and its acquisition to our tables all the year round as a luscious fruit makes the demand ever increasing. For cultivation in the open ground, he advised sowing the seed early in March in well-drained pots or pans, and placed in any warm house. When the seedlings appear remove to near the glass, shading slightly until the seed leaves are fully developed, then give full exposure to prevent spindly growth. After the second pair of leaves are formed, pot off singly into 3½-inch pots, using any good loamy soil, and slightly shade for a day or two. Keep them well up to the glass and do not overwater; water carefully, never allowing the soil to get dry. They should then have made strong growth, and will require shifting into 6½-inch pots, using loam, a little decayed manure, some burnt refuse, and a little soot; also to each barrow load of soil mix about a 5-inch pot of artificial manure. The soil should be moist, and heavy watering for a few days should be withheld; gradually harden off when well established, and about the end of May or beginning of June they will be ready for planting out, that is, providing the weather is favourable. The position outside for their reception should be very sunny, and the plants should be 2 feet to 3 feet apart. Put a stake to each plant and remove all side shoots as they appear. Pinch the top of the plant out above the third bunch of flowers. Manure water given twice a week when the fruits are swelling will help them considerably. Remove the fruits as they begin to ripen, for they will finish just as well laid on a warm shelf covered with a piece of paper. For culture in the greenhouse, where they can be grown all the year round, he recommended sowing the seed in September for April supply of fruit. After raising the seedlings pot on gradually into increasing sized pots until the 10-inch pot is reached early in the new year. The soil required for these is good loam and half-decayed horse manure, place the pots on the front stage, and train the cordons or stems at a distance of 9 inches to 12 inches under the glass. The removal of the side shoots, as recommended for outside cultivation, should be adopted, and the top of the plant pinched out when the required height is reached. When in bloom the stems should be slightly tapped periodically to help fertilisation, and care should be taken not to over-water them. Keep the temperature at 60°, and ventilate at all favourable opportunities. Disease is very prevalent during winter growth, and is prevented by constant attention to ventilation and temperature of the greenhouse, keeping the atmosphere buoyant at all times. Successional sowings should be made in January, March, and May for later supplies. The lecturer gave a few interesting comments on the diseases of the Tomato, and many excellent points were learned as to their prevention and cure. Following a hearty discussion of the paper, a unanimous vote of thanks was accorded Mr. Oxtoby for his extremely practical and well delivered lecture. Mr. A. Masien will give the next paper, "Summer Pruning," on August 18.

ROYAL HORTICULTURAL SOCIETY.

SCIENTIFIC COMMITTEE, JULY 7.

PRESENT: Dr. M. C. Cooke (in the chair), Messrs. Holmes, Gordon, Massee, Saunders, Professor Boulger, Reva. W. Wilks and G. Henslow (hon. sec.).

Apple trees and insects.—Mr. Saunders reports as follows upon specimens received from Mr. Campbell, of Ardross, Leeds: "The Apple trees are attacked by the caterpillars of two different moths, but the habits of both kinds are very similar. The green caterpillars are those of the winter moth (*Chematobia brumata*), the brown and yellow ones of the great winter moth (*Hybernia defoliaria*); both belong to the family Geometridae, and are two of the most destructive pests to Apple trees. The females of both kinds are wingless, or have only the rudiments of wings, so that they are incapable of flight. As the chrysalides are formed in the ground when the moths emerge, it is evident that they must climb up the trees if they wish to lay their eggs, as is their custom, near the buds. To prevent this is one of the most important things, if it is desired to protect the trees from attacks by the caterpillars. The simplest way of effecting this is to fasten greasy bands round the stems, which the caterpillars are unable to cross. As this might injure the tree if the grease came in contact with it, a strip of grease-

proof paper, 7 inches or 8 inches wide, and long enough to overlap an inch or more, should be tied round the trees, say 3 feet from the ground, and fastened top and bottom with bast matting or soft string that will not cut the paper. Over this should be tied a strip of calico about the same width, also tied top and bottom; this must be well smeared with cat-grease, soft soap, and train-oil mixed, so that a soft, sticky compound is formed in which the moths will be caught. These bands should be put into position as early as the middle of October, and kept in working order until well after Christmas. To do this the bands should be re-greased every now and then, or whenever it is found that the grease is losing its stickiness, or, as is sometimes the case, clogged up with the number of moths caught in it. Notwithstanding these precautions, some of the females may find their way into the young shoots. Some are no doubt carried by the males (who fly well) when coupled, so that it is useful, when it can be carried out, to spray the trees before the buds show any signs of opening with a caustic alkali wash, made by dissolving 1 lb. of caustic soda in half a bucket of water, add ½ lb. of pearlash, and stir until all is dissolved, then add enough soft water to make 10 gallons, and finally stir in 1 lb. of soft soap which has been melted in a little hot water. This mixture is very caustic, and must not be allowed to touch the skin or clothes, and if it does it should be wiped off as soon as possible. A still day should be chosen, so that the wind will not blow it on to the operators; this spraying should kill the eggs if any are laid on the tree. To destroy the caterpillars the trees should be sprayed as soon as the fruit has set with paraffin emulsion, or ½ lb. of Paris green and ½ lb. of lime mixed in 50 gallons of water. This mixture must be kept well stirred, as the Paris green is very heavy, and soon sinks to the bottom, and in this case some of the mixture will be too weak to kill the caterpillars, and the rest so strong that the foliage will be injured."

Lilac shoots and frost.—Mr. Massee showed a curious and important effect of frost on the leaves of the Lilac. The apex was frost-bitten, then, after a thaw, the leaf became attacked by *Botrytis cinerea*, which travelled down the region of the midrib and petiole, till it attacked the terminal bud between the leaves. As thousands of flower buds were thus destroyed in consequence of the late frost, such represented great pecuniary loss to the growers for the flower markets.

FLORAL COMMITTEE.

CHISWICK MEETING, JULY 15.

PRESENT: H. B. May, Esq. (chairman), Messrs. A. Ferry, C. Jeffries, R. Dean, W. J. James, W. Cuthbertson, W. F. Thompson, H. J. Jones, J. W. Barr, C. E. Fielder, J. F. McLeod, and C. Dixon.

The object of the above meeting was to examine Poppies of which the under-named were then regarded as the best. The following received the award of merit:—

Poppy Cardinal (white).—A vigorous and sturdy variety, about 1½ feet high, with handsome well expanded snow-white flowers, very beautiful, and approaching to 4 inches diameter. From Messrs. Dobbie and Co., Rothsay.

P. Maphitis.—This is also a sturdy, vigorous growing sort, of nearly erect growth, the large handsome single flowers some 4½ inches across, with deeply notched petals, being of a deep crimson hue, and blotched at the base with a darker shade. From Messrs. Barr and Sons, Covent Garden, W.C.

P. glaucum.—A very showy and neat growing Poppy, about 15 inches high, and well adapted for a variety of uses within the limits of the garden. The habit of the plant is branching, the handsome crimson flowers blotched at the base with deep crimson. From Messrs. Dobbie and Co., Rothsay, Messrs. James Veitch and Sons, Limited, and Messrs. Barr and Sons, Covent Garden.

The following were highly commended (* * *):

Poppy White Colossal.—An erect growing plant, 2 feet high or more, with double white narrow petalled flowers. The latter are fully 5 inches across. From Messrs. Barr and Sons, Covent Garden.

P. Murelli's pl. American Flag.—So called probably by reason of the large double white flowers having stripes of purple; the margins of the petals are touched with a similar shade. From Messrs. Dobbie and Co., Rothsay.

P. Blue Cardinal Victoria.—A pale pink double-flowered variety, erect in growth, and about 18 inches high; the growth is sturdy and vigorous. From Messrs. Dobbie and Co., Rothsay.

P. armarium.—A slender plant 15 inches high. Flowers scarlet with a heavy blotch of black at the base of each petal. From Messrs. Dobbie and Co., Rothsay.

FRUIT AND VEGETABLE COMMITTEE.

CHISWICK MEETING, JULY 14.

A second meeting of the fruit and vegetable committee was held at Chiswick on July 14.

PRESENT: Mr. G. Bunyard (chairman), Messrs. Owen Thomas, J. Jacques, G. Wythes, W. Bates, H. Markham, S. Mortimer, H. Ealing, G. Kelf, and A. Dean. Prior to commencing business it was unanimously agreed that Mr. S. T. Wright be requested to send on behalf of the committee a sincere expression of sympathy with Mr. W. Marshall in his illness. Mr. Bunyard introduced a remarkably fine sample of the new Givon's Late Strawberry, which received a first-class certificate a year or two since. It was reported as being remarkably fine and a splendid cropper at Maidstone. The fruits were of first-class quality. The whole of the Peas grown for trial other than the few early ones dealt with at the first meeting, were then examined, and ultimately first-class certificates were awarded to Peerless (Sutton and Sons), a very fine well-flavoured 3 feet Marrow, and a capital cropper, and to Improved Monarch (J. Sharp and Co.), a very fine variety 7 feet in height, pods large, and very abundantly produced.

Awards of merit were granted to Coleman's Favourite, 3 feet, very fine pods; Webb's Kaiser, similar height, pods long, green, and abundant; Rivenhall Wonder (Cooper, Taber and Co.), 20 inches in height and a remarkable

cropper; Aristocrat (Sharpe and Co.), 4 feet, heavy cropper and of fine quality; Sherwood Forest (Hurst and Son), a very fine 7 feet Pea and a great cropper; Progression (James Veitch and Sons), a capital 6 feet Pea of great excellence; and to Feltham Gem (James Veitch and Sons), 2 feet in height, and late, pods green, crop heavy, an excellent dwarf variety. Some Cabbages, spring-planted, were seen, but the stocks were both coarse and uneven. The Vegetable Marrow plants having been mulched with manure are now promising well. Potatoes so far look very well, and the dwarf Kidney Beans will soon be ready for examination.

DRILL HALL MEETING.

ORCHID COMMITTEE.

PRESENT: Harry J. Veitch, Esq. (chairman), Messrs. James O'Brien, de B. Crawshaw, Walter Cobb, Jas. Douglas, H. T. Pitt, T. W. Bond, W. H. Young, W. Boxall, J. Wilson Potter, H. Little, H. Ballantine, H. M. Pollett, M. Gleeson, and E. Hill.

M. S. Cooke, Esq., Tankerville, Kingston Hill, Surrey (gardener, Mr. W. Buckell), showed *Oncotoglossum crispum*, Cooke's variety.

Messrs. Thomas Rochford and Sons, Limited, Broxbourne, Herts, showed *Cattleya gaskelliana* and *Cattleya Mendellii* var. King Edward VII., the latter with pure white sepals and petals and pale yellow throat.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, showed *Cattleya Mossiae* var. Wagneri, C. Harrisoni alba, *Laelia majalis*, *Renanthra Storlei*, with rich crimson and brown flowers, and *Eulophiella peetersiana*.

In Messrs. Sander and Sons' group of Orchids were *Laelio-Cattleya Martinetii*, L.-C. Blechleyensis, *Cattleya Mossiae* coleata (very attractive), *Eria convallarioides*, *Cypripedium barbatrothochlidianum*, and *Cirrhaa warreana* (botanical certificate). Silver Flora medal.

NEW ORCHIDS.

A first-class certificate was given to *Laelio-Cattleya Blechleyensis Illuminata*.—*Cattleya gigas* and *Laelia tenebrosa* are the parents of this hybrid. It is a great improvement upon the typical hybrid (L. C. Blechleyensis); it is much larger, and the flowers are more richly coloured. Sepals and petals are rosy purple tinged with buff, while the lip is rich purple. From Messrs. Sander and Sons, St. Albans.

An award of merit was given to

Cypripedium x Ullor.—C. lawrencianum and C. sandersonianum are the parents of this new *Cypripedium*. The long drooping petals are dull green, spotted with brown, the dorsal sepal is a brighter green lined with purple-brown, and the lip is brown. Shown by Reginald Young, Esq.

FRUIT AND VEGETABLE COMMITTEE.

PRESENT: Messrs. George Bunyard (chairman), J. Cheal, Henry Ealing, George Woodward, S. Mortimer, Alex. Dean, T. W. Bates, George Kelf, Lewis Castle, J. Jacques, C. G. A. Nix, J. Willard, A. H. Pearson, H. Balderson, and Owen Thomas.

Messrs. James Veitch and Sons, Limited, Chelsea, showed a new Strawberry called President Loubet, the result of a cross between Waterloo and Sir Charles Napier. In appearance the fruit closely resembles Waterloo, but it has a flavour much like that of Sir Charles Napier. In this respect it is an improvement, for Waterloo, although valuable on account of its size, fine appearance, and lateness, leaves much to be desired as regards flavour. The committee made no award to this new Strawberry. Messrs. Veitch also showed a basketful of Loganberry, to which a first-class certificate was given.

Mr. H. Becker, Imperial Nurseries, Jersey, sent Gooseberry Grosvenor Giant, said to be a great bearer. The fruits are large, almost round, and greenish yellow. They much resemble the variety Leader.

Mr. W. Taylor, Hampton, Middlesex, showed Peach Libra (Blackmore). It is a fairly large fruit, and highly coloured. This Peach was raised from Alexander, the pollen parent being unknown. The fruits shown were gathered from a tree planted in a cold house December, 1901, and are below the size of those gathered from the same tree in July, 1902. The fruit committee wished to see this Peach again when fully ripe.

The Loganberry was shown by Mr. Thomas Denny, The Gardens, Blandford, but the fruits were badly packed and reduced to a pulp.

Tomato Becker's Excel All was shown by Mr. Becker, Jersey. It is a round, fairly large fruit, of very bright colour.

A new Cucumber called the Lemon Cucumber was shown by Hobbies Limited, Dereham. It is entirely distinct from the ordinary Cucumber, the fruits vary in length from 3 inches to 6 inches, are oblong in shape and ribbed. Their colour is cream or pale yellow, with purple dots. This Cucumber is of American origin, and its culture necessitates very little artificial heat.

Melon Libburn Favourite, a green fleshed, very juicy variety, of medium size, was shown by Mr. R. Mathers, Abbey View, Kelso.

Mr. George Hobday, Romford, showed large well filled pods of Pea Essex Wonder.

The Strawberry Grape was well shown by Dr. E. Bonavia, Westwood, Richmond Road, Worthing.

Messrs. John R. King and Sons, Coggeshall, Essex, exhibited a collection of culinary Peas, many good varieties were included. Silver Banksian medal.

Apple Early Victoria was shown by Messrs. Cross and Son, Wisbech.

A first-class certificate was awarded to

The Loganberry.—This now well-known Raspberry-Blackberry was exhibited by Messrs. James Veitch and Sons, Limited, Chelsea.

FLORAL COMMITTEE.

PRESENT: Messrs. H. B. May (chairman), and Messrs. C. T. Drury, J. Green, J. F. McLeod, W. Howe, C. R. Fielder, Charles Dixon, W. Bain, C. J. Salter, H. J. Cuthbush, R. W. Wallace, Charles E. Pearson, H. J. Jones, Charles E. Shea, W. P. Thomson, E. H. Jenkins, George Paul, W. J. James,

Amos Perry, Charles Jeffries, J. Fraser, E. T. Cook, and R. Dean.

Mr. H. B. May, Upper Edmonton, showed a collection of some thirty-six species and varieties of *Gymnogrammas*, mostly medium-sized plants. The group was quite a feature and beautifully arranged. Indeed, the taste displayed in this direction gave an additional charm to a most interesting gathering of Gold and Silver Ferns.

We were most pleased with *grandiceps* superba, a golden-tasseled form; *chrysophylla grandiceps*, a heavily-tasseled form; and *chrysophylla ramosa*, a dwarf erect variety, and all of golden hue. In the silvery section *Cordreyl*, *flavescens cristata*, *elegantissima*, *perviana cristata*, and *perviana argyrophylla* were the most effective.

Messrs. E. Wallace and Co., Colchester, set up a group of hardy flowers in which Japanese Iris predominated. In these we noted many fine forms, both in colour and size, the dark blue being especially good. Some *Lilliums* were also shown, and these included L. Browni, L. azoticum, L. longiflorum giganteum, L. Martagon dalmaticum, L. excelsum, and L. Humboldtii magnificum. *Crimum* Powellii, and *Pentstemon* Newbury Gem, a rich crimson-scarlet, were also shown.

Carnations of the border section were shown by Messrs. R. H. Bath, Limited, Wisbech. The pot plants included Geo. Alexander (yellow), Amber Queen Albatross (bluish), Carmen Sylva (yellow ground with rose flakes), Tru Jan (white), Hayes (scarlet), White Queen, Mrs. A. Campbell, Kubelik (yellow ground with rose), Lucifer (a fine scarlet), &c.

Messrs. J. Hill and Son, Lower Edmonton, showed a small group of *Nephrolepis* Fosteri, a distinct plant. It is a handsome and decorative plant and should prove of a serviceable character.

Carnations were staged by Messrs. J. Peed and Son, West Norwood, the group including border sorts as well as Malmalsons in variety. Cecilia was well shown, and all the plants were in pots.

Messrs. William Cutbush and Son, Highgate, staged an admirable group of Malmalson and other Carnations surrounded by light Bamboos. Among the Malmalsons Lady Rose is perhaps the most charming, a lovely shade of soft rose; President Loubet, crimson scarlet; Mrs. Trelawny, red-scarlet; Calypso, Princess of Wales, Nautilus, &c. Merlin, yellow ground; Chief Baron, Bet, Grace, and Cecilia were among the best.

Hardy flowers from Messrs. Barr and Sons, Covent Garden, included *Phloxes*, *Eranthis* Youngi, *Lychnis chalcedonica*, *Platycodon grandiflorus*, *Eryngium amethystinum*, *Lilium Humboldtii magnificum* (very fine), some fine *Galliarthias*, *Lilium Martagon dalmaticum*, a choice set of hardy Water Lilies, *Lilium Browni*, *Androsace coronopifolia*, *Phlox* Mrs. Jenkins, *Lupinus arboreus*, &c.

Mr. Amos Perry, Winchmore Hill, had a lovely lot of Water Lilies that included N. ellisiana, N. andrea, N. marliacea carnea, N. robinsoniana, N. gloriosa (a grandly coloured form), N. gladioliflora (a superb white, with golden centre), N. odorata maxima, and many others. The perennials included *Campanula lactiflora* in several varieties, *Platycodon grandiflorus*, *Heuchera sanguinea* (Walker's variety, very rich in colour), and *Spiraea gigantea* and its variety *elegans*.

Messrs. H. Cannell and Sons, Swanley, Kent, showed double *Begonias* in capital form, Lady Naylor Leyland, salmon; Mrs. Thompson, sulphur; Khaki; Miss Balfie, soft pink; Earl of Devon, scarlet; and Lady H. Erskine, white and pink. A bedding strain called Eureka was represented by crimson, scarlet, and pink flowered sorts. It is evidently a most useful strain.

Messrs. J. Veitch and Sons, Chelsea, showed large masses of *Phloxes*, *Hemerocallis* Thunbergii, *Galega*, white perennial Pea, *Rudbeckia californica*, *Monarda didyma*, *Lilium candidum*, with *Campanulas*, *Pentstemons*, *Eryngiums*, and other things. In another group the firm set up a large array of Java *Rhododendrons*, pot-grown plants, showing the freedom of flowering and beautiful variety these things contain. In yet another group border Carnations were arranged. In Sweet Peas Messrs. Veitch had many good things.

Carnations were finely shown by Mr. A. F. Dutton, Bexley Heath. The varieties were Royalty, rose-pink; G. H. Crane, scarlet; Mrs. T. Lawson, cerise; and Mme. McIba, pink. Certainly a remarkable lot.

Roses from Messrs. Wm. Paul and Son, Waltham Cross, were very charming. The blooms were shown in groups in baskets. Hybrid Briar, Soleil d'Or, Beauté Inconsciente, Billiard et Barré (golden buff), Edmond Deshayes (white), Floribunda, White Maman Cochet, Earl of Warwick, a new Tea Rose, very finely perfumed, soft pink, and likely to prove a good bedding Rose, and Frau Karl Druschki, pure white, were well-shown.

Sweet Peas in variety came from Lady Plowdens, Wallingford.

Messrs. William Bull and Sons, Chelsea, showed a series of *Fuchsias*, both single and double. *Nautilus* in the latter class has a rosy white corolla; *Vallant*, red, single; *Prince of Orange*, single, being also noteworthy.

Messrs. Phillips and Taylor, Bracknell, Berks, showed Carnations, Water Lilies, and hardy plants in variety. Of the Water Lilies there was a good assortment, but the flowers generally were not sufficiently advanced. A good collection of border Carnations was included, and these again were of a representative character.

Lawrence Currie, Esq., Mentley Manor, Farnborough, Hants, set up a fine lot of some two dozen Water Lilies in pans in the cut state. In some instances as many as one dozen flowers were exhibited, and these of the finest description. Of the more noticeable were N. Marliacea alba, N. M. Rosea, N. odorata, N. alba candidissima, N. ellisiana, N. Marliacea chromatella, N. tuberosa, N. pygmaea helvola, N. Laydekeri lilacea, &c. This handsome lot was well backed by Bamboos and interspersed with Ferns made a lovely display.

Messrs. Dobbie and Co., Rothesay, had an assortment of Sweet Williams which they call Auricula-eyed strain. The strain certainly is a very fine one, and quite representative of this useful flower. The trusses, too, were handsome, and

the flowers individually of large size and good form. The strain was commended by the committee.

Cut Roses were well shown by Messrs. Paul and Son, Old Nurseries, Cheshunt. Belle Siebricht, Her Majesty, Mme. Ravary, Marquis of Salisbury, Alfred Colomb, S. Reynolds Hole, Bessie Brown, and Caroline Testout being among the best. The blooms were finely shown in vases.

Mr. James Douglas, Great Bookham, showed Carnations well, Triton (crimson), Seymour Corkran (yellow), Badoura (yellow ground, light rose edge), Copperhead (orange-scarlet, a fine shade), Rizzio (yellow), Othello (dark crimson edge), Heperia (yellow ground, fancy), Lord Napier (yellow, with the finest possible edge of rose colour), Agnes Sorrell (fine crimson, large), and Bookham Clove, being the best in a very large lot.

NEW PLANTS.

The following received a first-class certificate:

Nymphaea gigantea Hudsoni.—A giant form of the blue-flowered section. The variety is bolder generally than in typical N. gigantea, the several rows of petals broader and rounder, and the entire flower more decidedly reflexing. The colour is deep mauve-blue, with golden centre. The flower shown was just 9 inches across the spread of the lower segments. A very handsome Water Lily. Shown by Leopold de Rothschild, Esq., Gunnersbury House, Acton (gardener, Mr. Hudson).

The following received an award of merit:

Lilium elegans Peter Barr.—This is one of the orange-yellow forms, of which Alice Wilson and Orange Queen are among the best in this shade of colour. The plant is usually about 12 inches high, and in this way makes admirable examples for grouping among shrubs or for pot work. The flowers are of good size, more starry, and less intense in the orange-yellow shade than the others named. Exhibited by Messrs. Barr and Sons, King Street, Covent Garden.

Begonia Marie Bouchet.—A very remarkable variety for basket work where the trailing growth and the great freedom of flowering would be seen to advantage. Many of the trailing shoots were fully 4 feet long, the plant, as shown, 3 feet across or more. The flowers are crimson-scarlet, with a curious doubling in the centre that gives the whole plant a characteristic quaintness. Shown by W. Greenwell, Esq., Malden Park, Woldingham (gardener, Mr. W. Lutott).

Nephrolepis Fosteri.—A very useful decorative Fern, good either in specimen form or as quite ordinary size plants in 5-inch pots. The habit is semi-erect, and the plant is of a pale green colour. From Messrs. Hill and Son, Edmonton.

Asparagus plumosus cristata.—As shown, this is quite a dwarf form, little more than 1 foot high above the pot. The dark green, rather dense habit at first, reveals but little of its character; but with the maturing of the "fronds," so-called, the pale green tips develop a plumose crested character of some density, which is very similar to the same feature in many Ferns. Shown by Sir Trevor Lawrence, Bart., Balford, Dorking (gardener, Mr. Bain).

Pteris metallica.—A species with dark olive green leaves, as shown, the habit generally erect, the divisions of the fronds oblong-lanceolate. The hard texture of the fronds should render the plant a most serviceable one. Shown by Mr. H. B. May, Upper Edmonton.

LIST OF MEDALS.

Silver-gilt Flora to Messrs. J. Veitch and Sons, Chelsea. Silver-gilt Banksian to Messrs. Cutbush, Highgate.

Silver Flora to Messrs. Currie, Farnborough; Mr. H. B. May, Upper Edmonton; Mr. Dutton, Bexley Heath.

Silver Banksian to Messrs. Wallace and Co., Colchester; Mr. Amos Perry, Winchmore Hill; Mr. Jas. Douglas, Great Bookham; Messrs. W. Paul and Son, Waltham Cross; Messrs. Paul and Son, Cheshunt.

The strain of Auricula-eyed Sweet Williams, from Messrs. Dobbie and Co., Rothesay, was commended.

LECTURE.

Mr. G. Hunt gave a lecture entitled "Horticulture in, and the Flora of, New Zealand." The lecturer said that horticulture had made rapid strides in New Zealand. The Rose had many admirers, all the new English and Continental varieties are grown. The Chrysanthemum also is grown to perfection. Its culture, however, now is of secondary importance to the Rose. Both these plants bear the sea voyage well; this cannot be said of most soft-wooded plants, which are raised from seed chiefly. Zonal *Pelargoniums* are largely grown also, even the most recent varieties. Many of the plants most commonly grown in England are quite at home in New Zealand, except in the south, where it is too cold for some of them. The neighbourhood of Wellington is not so favourable to gardening as Christchurch, which has a more genial climate and good soil. Mr. Hunt said that trees and plants familiar at home assume quite a different aspect in New Zealand; plants become bushes, and shrubs become trees. The public garden at Christchurch is one of the best and is well maintained.

Potato culture has been taken up by settlers. Good Grapes are produced upon land reclaimed from the bush. The Government, as an experiment, planted 3 acres of such land with vines, and the yield of wine the first year was 800 gallons, which, at 5s. per gallon, would fetch £200, or two-thirds of the original expense, which amounts to £100 per acre. It is to be hoped that the Government will help settlers to establish viticulture as a permanent industry in New Zealand. *Phormium tenax* (the New Zealand Flax) is so abundant that the mills are supplied with fibre from plants growing wild. Mr. Hunt mentioned that Apples were grown, but some years must elapse before they can be exported in sufficient quantity to compete with Tasmanian fruits. Various pests are very destructive, and the lecturer seemed to think that until the Government introduced compulsory measures for the cleansing of orchards little progress would be made. The climate is well suited to Apple culture. Strawberries and Raspberries are largely grown, and usually command good prices.

The lecturer said there was a good field in New Zealand for people with small capital; every facility is offered to those going out for the purpose of fruit farming, &c. Strong,

steady young men are wanted to bring the bush land into cultivation. A hearty welcome always awaits British settlers. With reference to the flora of New Zealand, Mr. Hunt said that the native flowers are remarkable for their quiet colouring. Brilliantly coloured flowers are the exception. He instanced as being some of the most remarkable, *Myrtles*, *Eugenia*, *Ranunculus*, *Magnolias*, *Violas*, *Pittosporum*, *Hibiscus*, *Linum*, *Pelargoniums*, *Buckthorns*, *Ceanothus* (one of the most striking of New Zealand flowers), *Sedums*, *Sundews*, *Veronicas*, &c. Mr. Hunt said he would be glad to give information to anyone respecting the flowers of New Zealand and also seeds of them.

He suggested that when the society came to make its new garden it should devote portions to the best plants of various colonies, and so tend to foster the study of the colonial flora. Mr. A. H. Pearson, who occupied the chair, proposed a hearty vote of thanks to the lecturer.

NATIONAL CARNATION AND PICOTEE SOCIETY.

A FINE exhibition was held in the Drill Hall on the 21st inst. It was one of the finest displays of the Carnation society has held for years. There was heard, as is usual, some condemnation of the method of showing flowers with white paper collars on boards, a method which has survived years of denunciation, and will many more. The hall was largely occupied with the competitive exhibits, and groups of Carnations were contributed by several members of the trade.

DIVISION I.—The leading class was for twenty-four Carnation blooms, bizarres and flakes, and there were but three exhibitors, the first prize falling to Mr. Thomas Lord Florist, Tudmoreton, whose leading blooms were P.F. George Lewis, C.B. J. S. Hedderley, S.B. Robert Houlgrave, R.F. Merton, C.B. George, C.B. Master Fred, S.B. Robert Lord, P.P.H. William Skirving, S.F. Sportman, P.F. George Melville, C.B. Guardaman, C.B. J. D. Hextall, S.B. Admiral Curzon, R.F. Mrs. T. Lord, and R.F. H. Shoemith; Mr. Martin K. Smith, Hayes (gardener, Mr. C. Bick), was second, whose leading blooms were S.B. Dorothy and Halim (two seedlings), C.B. Nestor and Adonis (also new), P.F. Euphonia, and J. S. Hedderley, R.F. Genevieve and Flava (seedlings), S.F. Gladiator (new), K.F. Sweet Nell, Markham, Dalby, and Dorothy (all new); third, Mr. C. Turner, Royal Nursery, Slough.

The next class was for twenty-four selfs, in which some very fine blooms were staged; Mr. M. E. Smith was placed first, having superb flowers; of maroon and crimson shades there were Sir Bevy, Guinere, Kara, Agnes Sorel, and Don John; scarlet and rose, Anne Boleyn, Helen and Floradora; apricot, Swabshucker; yellow, Cecilia, the Naiad, and Daffodil; white, Hildegarde, Mrs. Eric Hambro, and Blanche. Mr. F. A. Wellesley, Woking, who has come to the fore in strong force this season, was placed second; he had fine blooms of Agnes Sorel and Almoner, yellow; Falcon, yellow; Cecilia, Mrs. W. Moatyn, purple; Benbow, apricot; Mrs. J. Douglas, rose, &c.; third, Messrs. W. Artindale and Son, Florists, Sheffield. With twenty-four fancy Carnations Mr. F. A. Wellesley, was first, with what appeared to be perfect blooms so finely were they developed; they consisted of Hildaigo, Charles Martel, Monarch, Argosy, Perseus, Amphion, Voltaire, Primrose League, Guinevere, Queen Bess, Paladin, Clapay Queen, Ormonde, Osalan, and Mrs. T. W. Wellesley, a beautiful new variety, yellow ground, flaked on the petal edges with maroon and crimson; Charles Martel, &c. Mr. M. R. Smith came second, he had very fine blooms of Lily Duchess, Bedemer, Hesperus, Bellicent, Athelstan, A. W. Jones, Queen of the Isles, Cavalier, Corporal Trim, The Beer, Thor, Hildaigo, Kameses, &c. Messrs. Blackmore and Langdon, nurserymen, Tiverton, Bath, were third with some very fine blooms, and Mr. C. Turner was fourth.

White ground Picotees were not so numerously shown, but there were five exhibits. Mr. F. A. Wellesley taking the first prize with some finished blooms, pure in the ground and bright on the edges. Of heavy edged reds there were Brunette, W. E. Dickson, Ganymede, and John Smith; light red, Thos. William; heavy purple edges, Amy Roberts, Muriel Miriam, and Fanny Tett; light purple edges, Somerset; heavy rose edge, W. H. Johnson, Ohio, and Mrs. Payne; light rose edge, Fortrose, Nellie, and Favourite. Mr. M. E. Smith came second with some very good blooms, in which heavy rose edged flowers largely preponderated; there were of heavy red edged Manners, Brownie, and Ganymede; light red edged Grace Darling; heavy purple edged, Amy Roberts, Beau Nash, and Miriam; light purple edged, Duchess of York; heavy rose edged Tiptop, Mrs. Berwick, Acacia, Little Phil, Miss Sophy Grahame, Duchess of York, and Lady Louisa, and light rose edged Fortrose, and Favourite; third, Messrs. W. Tuplin and Sons, Florists, Newton Abbot.

In each of the foregoing five classes it was necessary there should be not less than twelve varieties. With six blooms of one variety, self Mr. M. R. Smith was first with Daffodil, a very fine pure yellow; Mr. F. A. Wellesley was second with Old Germania, yellow, in fine character; third, Mr. C. Turner, with Sir Bevy, maroon. With six blooms of a yellow or buff, fancy, one variety, Mr. F. A. Wellesley came first with Mrs. F. A. Wellesley, a beautiful pale yellow ground flower, edged with lines of rose-scarlet and maroon; this variety also received a certificate of merit. Mr. M. E. Smith was second with King Solomon, having vivid flakes of red and maroon on a light yellow ground; very showy. Messrs. Blackmore and Langdon came third with Kitchener, pure yellow, heavily edged with bright red; also awarded a certificate of merit. With six blooms of a fancy Carnation, other than yellow ground, Messrs. Blackmore and Langdon were first with their charming variety Millie, uniform and highly finished blooms of which were staged. It is pure white, with a few lines of rose at the point of the middle of each petal. Mr. F. A. Wellesley came second with the same, and Mr. M. R. Smith third with Mr. Sebright, rosy pink with flakes of heliotrope, a finely formed and distinct flower. With six blooms of a yellow ground Picotee, also one variety, Mr. Smith again came first with Mrs. Walter Heriot, a beautiful and refined flower having a wire edge of rose. Mr. Wellesley came second with Lady St. Oswald,

and Messrs. Artindale and Sons, Sheffield, third with Child Harold.

With twelve distinct varieties, selfs, fancies, and yellow grounds, three blooms of each variety in a bottle, Mr. M. R. Smith was placed first with very fine blooms, although not dressed; they were unnamed, and represented selfs and fancies; Messrs. Blackmore and Langdon were second, and Messrs. Artindale and Son third.

Then came single blooms in their several classes. Crimson bizzars: First, Messrs. Thomson and Co. with Robert Houlgrave; second, Mr. J. Butt with the same; and third, Mr. E. Paah with Admiral Curzon. Crimson bizzars: First, Mr. Wellesley with J. S. Hedderley; Mr. Butt was both second and third with the same variety. Pink and purple bizzars: First, Mr. D. Walker with William Skirving; and Mr. Wellesley third with the same; Mr. E. J. Wooten second with Sarah Payne. Purple flukes: First, Mr. W. Spencer, and second Mr. E. J. Wooten with George Melville; Mr. J. Fairlie came third and fourth with Gordon Lewis. Scarlet flukes: First, Mr. Wooten with sportman; Messrs. Thomson and Co. second with J. J. Keen, a bright new variety of decided promise; third, Mr. Paah with Sportman.

Rose flukes, a refined variety named Merton won the first four prizes; Messrs. W. Pemberton and Son, florists, Walsall, were first and second; and Mr. J. G. Keen, Southampton, third and fourth. Selfs, white, or bluish: Mr. R. C. Cartwright, King's Norton, was first with Ensign, and Mr. A. J. Cook second with Ensign. White: Mr. Cartwright came third with Much the Miller. Rose or pink selfs: First, Lady Hermione, from Mr. W. H. Porter; a promising seedling from Mr. E. J. Wooten was second; and Bomba, from Mr. A. J. Cook, third. Scarlet or crimson selfs: First, Mr. W. Spencer with a scarlet sport from S.F. John Wormald; Mr. Cartwright came second with a seedling; and Mr. D. Walker was third with Sirdar. Bright crimson maroon or purple selfs: First, Mr. E. Harrington with Helen, crimson-purple shaded with maroon; and he was second also with the same; a variety named Mrs. Mostyn, purple, was third. Yellow selfs: First, Mr. E. J. Wooten with Almoner, pale yellow; Mr. E. Harrington came second, and Mr. W. Spencer was third with Old Germania, very good.

Buff selfs: First, Mr. Wellesley; and second and third Mr. R. C. Cartwright, each with Benbow, the best of this class of colour. Fancy yellow grounds: First, Mr. B. Nash with Monarch; second, Mr. Wellesley with Mrs. F. A. Wellesley; and third, Mr. Cartwright with Argus. Fancy, other than yellow grounds: First, Mr. Smith with Nestor (white ground, with heavy pencillings of scarlet); Mr. Cartwright was second; and Mr. E. J. Wooten third with Artemis (flaked with scarlet on a slate ground).

Picotees were also shown in single blooms. Heavy red edges: First, Mr. B. Nash with Mrs. Anstias; Mr. J. J. Keen was second; and Messrs. W. Pemberton and Son third with John Smith. Light red edges: First, Mr. Keen; second, Mr. Spencer with Thomas William; Mr. J. Butt came third with Grace Darling. Heavy purple edges: First, Messrs. Thomson and Son with Fanny Tett; second, Messrs. W. Pemberton and Son with Amy Roberts; Mr. J. Butt coming third with Fanny Tett. Light-edged purple: First, Mr. Wellesley with Summerhill; second, Mr. E. J. Wooten with Pride of Leyton; Mr. J. Butt was third with Lavinia. Heavy-edged rose or scarlet: First, Mr. E. J. Wooten with Fortrose; second, Messrs. W. Pemberton and Son with Lady Louisa; and third, Mr. W. Spencer with Mrs. Payne. Rose or scarlet, light edges: Mr. Wooten was placed first, and Mr. Spencer second with Favourite. Mr. Wellesley coming third with Fortrose. Yellow ground, heavy edges: First, Mr. Keen with Gronow, Mr. Smith coming second with Dalketh; the same variety was also third, but no name of an exhibitor was appended. Yellow ground, light edges: Mr. Smith was first with Mrs. Walter Howard; neither the name of the flower or the exhibitor appeared on the second prize bloom; Mr. B. Nash was third with Heliodorus. Premier flowers: The selection of these entails a great amount of labour on the part of the judges, as every bloom in the show is a competitor. The premier bizzar was C.B. J. S. Hedderley, a very fine bloom from Mr. Wellesley, and he had the premier fluke in P.F. Gordon Lewis. Self: Ensign (white), from Mr. Cartwright. Fancy: Mrs. F. Wellesley, from Mr. Wellesley. Heavy-edged white ground Picotee: John Smith, from Mr. J. J. Keen. Light-edged Picotee: Lavinia, from Mr. A. J. Rouberry. Heavy-edged yellow ground: Dalketh, from Mr. Smith. Light-edged: Child Harold, from Mr. E. H. Buckland.

The silver cup offered in this division for the greatest number of points scored was awarded to Mr. F. A. Wellesley.

DIVISION II.—Here the leading class was for 12 white ground Carnations. Messrs. W. Pemberton and Son were first with very good blooms, chief among them E.F. Merton, S.F. Flamingo, P.F.B. J. D. Hextall, P.F. Geo. Melville, R.K. Mrs. Rowan, P.F. Charles Henwood, S.B. Robert Houlgrave, and S.F. Sportman; second, Mr. W. Spencer, jun.; third, Messrs. Thomson and Co. With 12 selfs, Mr. W. Spencer took the first with highly finished blooms of Almoner, Barras, Hildegarde, Jocelyn (heliotrope), Sultan, Much the Miller, Orpheus, Orion (blush), Benbow, Germania, Helen, and Britannia. Messrs. Thomson and Co. came second, also with very fine blooms, chief among them Enchantress, Mrs. F. Sims, Dick Donovan, The Sirdar, Amphion, &c.; third, Messrs. Phillips and Taylor, Bracknell. With 12 fancies Mr. Spencer was again to the fore with splendid blooms of Paludin, Voltaire, Galileo, Argosy, Artemis, Queen Beas, Monarch, Ormonde, Mrs. Tremayne, Oleron, and Amphion; second, Messrs. Thomson and Son, also with excellent blooms; third, Messrs. Phillips and Taylor. With 12 white ground Picotees Mr. B. Nash was first, Messrs. Pemberton and Son second, and Mr. Spencer third. They comprised the varieties given in Division I.

With twelve yellow ground, Mr. B. Nash came first, having excellent blooms of Heather Bell, Lady St. Oswald, Lady Bristol, Hesperia, Evelyn, Mohican, and Mrs. Douglas; second, Messrs. Thomson and Co.; third, Mr. W. Spencer. With six blooms of a self, one variety, Mr. W. Spencer was first, and Mr. B. Nash second with Mrs. Eric Hambro,

white; Messrs. Phillips and Taylor coming third with an unnamed yellow. The best six blooms of a yellow or buff fancy were Voltaire, very fine, from Mr. W. Spencer; Mr. B. Nash came second, with Mrs. Tremayne; and Messrs. Thomson and Co. third with Voltaire. With six blooms of any other but the above, Mr. E. Harrington was first with Ivo Sebright in beautiful character; Mrs. Brookes Smith, white flaked with rosy crimson from Mrs. Brookes Smith, second; Mr. W. Spencer coming third with Muletter slaty crimson, flaked with scarlet. With six varieties selfs, fancies, or yellow grounds, three blooms of each in bottles, Mr. S. Morris, Wretham Hall, Thetford, was first with very good blooms, nicely arranged; Mr. W. Spencer was second; and Messrs. Thomson and Co. third. The winner of the cup in this class was Mr. W. Spencer, Southampton.

DIVISION III. was for growers of small collections, and in these good flowers were staged. Mr. James Fairlie had the best six blooms of Carnations, while Mr. R. C. Cartwright came first with six selfs, having Lady Hermione, Much the Miller, Sir Bevis, Mrs. C. Sharpin, Orpheus, and Germania in fine character; Mr. D. Walker, Kilmarnock, was second in both the foregoing classes. Mr. Cartwright came first with six fancies, and Mr. E. W. Wilson had the best six blooms of white ground Picotees; Mr. E. H. Buckland the best six blooms of yellow ground Picotees, among them a finely finished bloom of Child Harold.

There were several classes for three blooms, in which Mr. E. Harrington took several first prizes, showing excellent blooms. There were also several classes for sixes of undressed blooms in several sections, and also for single blooms; and a class for seedlings also, two blooms of each being shown, the leading blooms in which are mentioned below as certificated flowers. The cup offered in this class was won by Mr. R. C. Cartwright.

Carnations in pots: Though four classes were set apart for these there was but one exhibit, that from Mr. C. Turner filling a space of 50 feet, to which a first prize was awarded.

Floral decorations were provided for in the class for two bouquets. Mr. M. B. Smith was placed first with one of white; the other of mixed Carnations, tastefully arranged with appropriate foliage. Mr. D. Oliver was second with two poor bouquets, one of white, the other of pink Carnations. The best vase of Carnations was from Mr. Smith, mixed colours being prettily arranged with Asparagus and other foliage. Mr. Healing, Reigate, was second, with much the same details. Mr. W. Spencer staged the best three ladies' sprays, and Mr. Smith the best buttonholes.

Certificates of merit were awarded to the following seedlings: To Mrs. F. A. Wellesley, a beautiful flower, fine in petal and bright in colour, pale sulphur ground with marginal markings of rose-scarlet and maroon. From Mr. F. A. Wellesley, Woking.

Ivo Sebright, bright rosy pink, with flakes of pale heliotrope, a beautifully formed flower, distinct, and quite novel. From Mr. M. V. Harrington.

Speranza, a very fine, pale yellow ground Picotee, edged with deep rose. From Mr. M. B. Smith.

Richness, a handsome yellow ground fancy, heavily edged with bright red, a rich and striking variety, from Messrs. Blackmore and Langdon, Twerton Nursery, Bath.

A striking scarlet flake Carnation named J. J. Keen, the flakes of bright scarlet on a white ground, failed to gain an award, but it is highly promising. It was shown by Messrs. Thomson and Co., Birmingham.

HIGHGATE HORTICULTURAL SOCIETY.

THE forty-fourth annual exhibition of this well-known society was distinctly in advance of most of those of recent years. It was held on Thursday, 16th inst., in the grounds of Southampton Lodge, the residence of Colonel J. Wilkinson. Wet weather, unfortunately, marred the proceedings.

In the larger tent no less than nine groups were displayed in the different competitions. For a group of flowering and foliage plants, a beautiful arrangement of plants of good quality deservedly placed Mr. J. Callingham, gardener to Mr. H. Harnsworth, North End Place, Hampstead Heath, first. The plants were well arranged. A bolder arrangement secured second prize for Mr. T. L. Turk, gardener to Mr. T. Boney, Southwood House, Highgate. In this instance also the plants were of good quality.

A group of exotic Ferns, Caladiums, and Coleus, arranged for effect, in a space 50 feet square, made a very rich and striking feature. There were two exhibits, a highly meritorious group winning first prize for Mr. E. H. Chitty, gardener to Mr. S. Hardy, Cholmeley Lodge, Highgate. Mr. Turk was a good second. The group of flowering plants was a pretty feature, that which gained premier honours for Mr. Turk being an exceptionally striking one. Fuchsias, Begonias, Cannas, Spireas, Petunias, and the Chimney Campanulas, with other plants, making a splendid display; Mr. Chitty was placed second.

A special class for a group, open to single-handed gardeners only, found Mr. J. Adams, gardener to Mr. E. H. Smithett, Hillside, Fitzroy Park, Highgate, leading with a distinctly attractive group. The second prize went to Mr. Chitty, who had a good collection. For six Coleus, distinct, a capital series secured leading honours for Mr. G. Drage, gardener to Mr. E. P. Sells, Sarnesfield, Highgate. Not so good a set placed Mr. Chitty in the second position.

Mr. Drage again led in the class for six Gloxinias, distinct. This was an exceptionally handsome lot of plants. The colours also were superb. Close up was Mr. G. W. Earp, gardener to Mr. J. S. Sellon, The Grange, Highgate. The colours and the individual flowers in this instance were superbly fine. A less regular series was placed third, this came from Mr. W. Smith, 81, Canonbury Road, Highbury.

For six tuberous-rooted Begonias, distinct, grand plants of the better type of these flowers secured first prize for Mr. Drage. The plants were large and freely-flowered, and gave evidence of good culture. Good plants, though of poorer quality, placed Mr. Chitty second.

Excellent plants of six exotic Ferns, in a class open to single-handed gardeners, were freely shown. There were four entries, and a good set well merited first prize for Mr.

Chitty, Adiantums and Pterises being well shown. Mr. J. Adams was an uncomfortably close second, and Mr. Smith a good third. These plants were much better than usual.

Nine stove or greenhouse plants, suitable for house decoration, in pots not exceeding 7 inches in diameter, at least three to be in flower, gained Mr. Callingham the first prize, and the second award went to Mr. Earp.

In the open class for twenty-four bunches of hardy cut flowers, distinct, Mr. G. W. Earp was placed first with a splendid series of bunches. A good second was Mr. D. R. Crane, 4, Woodview Terrace, Highgate, who also had large bunches more pleasingly disposed.

Mr. Crane was an easy first in the class for twelve bunches of Sweet Peas, showing this popular annual in grand form. Mr. Earp was second, and Mr. Callingham third.

For dinner table decorations there were but three entries, Mr. Turk being placed first, Mr. D. B. Crane second, and Mr. Chitty third.

In a collection, hardy fruits were exceptionally well shown by Mr. Earp. A collection of nine dishes secured second prize for Mr. D. B. Crane.

Messrs. Wm. Cutbush and Son, Highgate and Barnet, put up a pretty group, in which freely flowered plants of Verbena Miss Willmott, the new Marguerite Coronation, and Lantanas were excellently represented.

A word of praise is due to Mr. W. E. Boyce, the secretary and superintendent; the arrangements left nothing to be desired.

GARDENS OF JAMAICA.

(Continued from page 47.)

THE BREAD FRUIT.

In some parts of this country the Bread Fruit is found in great perfection. Few trees are more valuable and better reward the culture of the husbandman. They were introduced from the Society Islands, and there is now in existence at Hopeton, in the parish of Westmoreland, one of the original trees which grew from a plant brought by the Bounty to the island.

The tree is graceful and beautiful in its appearance, particularly when it is covered with fruit, which sometimes is as large as a man's head. The leaves are very large and curiously scalloped. The fruit has round marks on it, having something the appearance of scales. It cannot be eaten in an uncooked state, but when roasted it is an excellent substitute for bread. The inner part has the consistency of a firm white Potato, with small seeds occupying the very centre. When these are removed the Bread Fruit is usually eaten hot with butter.

There is another very remarkable tree, bearing a fruit which has some resemblance to the Bread Fruit. It is called

THE JACK FRUIT.

This tree is larger than the one about which we have been speaking, and, instead of being cultivated like the Bread Fruit, grows wild. Its leaves are much smaller and less beautiful, but the curious feature of it is that the fruit, instead of being produced from the small boughs and overhanging limbs, grows from the trunk and larger branches. It is most singular to see them on the huge trunk, especially as they generally grow to nearly double the size of the Bread Fruit. It is not rounded in the same way, but is straggling and irregular in its form, having small, soft prickles on it, like another fruit of which we shall presently speak. The Jack Fruit when eaten is roasted like the Bread Fruit, but it is not palatable.

THE SOUR-SOP.

is the fruit to which we have just referred, the appearance of which is very like the Jack Fruit, except that it is much smaller. The skin, too, is of a darker green, and the soft prickles more widely separated one from the other. Unlike the Jack Fruit, it is eaten in its uncooked state, like any ordinary fruit, and it is produced from the smaller branches. When the skin is broken it presents a mass of long black seeds, covered with a white pulp. This pulp is eaten, and although not very wholesome, it possesses a delicious acid flavour, and is much liked by some persons. Of the same character is

THE SWEET-SOP,

which is so called from its being much sweeter than the other. It is formed in much the same way. The skin, however, is without the soft prickles already mentioned, but there are small, round compartments, which, as the fruit ripens, become more and more separated one from the other, until extreme ripeness would lead to its breaking.

Both these trees are of moderate size, and do not differ materially in the nature of the foliage. We have now to speak of

THE FIG,

and in doing so it must be borne in mind that there is no resemblance between the Indian Fig and that which is known in England. The English Fig is grown in Jamaica, but that which is commonly so called produces a fruit, which, although it is eatable, is hardly ever eaten. Some of these trees are of great size, with thick boughs and foliage of a dark colour; they bear a small red fruit.

But the most singular feature of this tree is, that it is generally, though not universally, produced from a parasite not very unlike the Mistletoe. It is probable that the seeds are deposited by birds on the boughs of large trees. Roots from these seeds strike into the boughs, and these roots in process of time descend until they reach the ground. They then take root, and as they increase in size and strength gradually cramp and surround the tree from which they have grown. The tree languishes, and after the lapse of some years dies, leaving the Fig tree to occupy its place.

As an amusing illustration of the tenacity of character of the Scotch people, and the soft indolence of the Creole, the Fig tree in the act of destroying that from which it has sprung is called "the Scotchman hugging the Creole to death!" The roots which descend from the fostering tree form distinct trunks, and thus some of the Fig trees may be seen having as many as seven separate trunks, all of which become united at the points whence the branches radiate. The tree which we see on yonder hill is

THE CALABASH.

It is almost the size of an Apple tree, but with its pretty light branches stretching out on each side in most regular order. The leaves are rather small, and appear more inconsiderable from their being thinly scattered about the boughs.

From the limbs a large quantity of fruit is hanging. They vary in size from that of an Apple to that of a large lamp globe. They are of a green colour, but become dark brown when dried in the sun. The fruit of the Calabash is very useful for making drinking and other vessels for the natives. There is a hard outer shell, and this being carefully divided in two, and a part of one side cut off, one side becomes a cover for the other, and a neat box is thus formed. The inner part of the Calabash is a hard pulp, which is sometimes used for cleaning furniture, but is otherwise of no value. We may here observe a production of the same kind, and that is

THE GOURD.

This is a large creeper, producing a kind of Calabash. Some of them are almost the size already mentioned, but others attain a very considerable growth. The shape of these differs from that of the Calabash, being of the form of the Pear, with a long narrow neck. They are very much used by the natives for carrying water, and some of them will contain three or four gallons. They are, of course, very liable to be broken, but some Gourds are made with care to last for many years. We must not confound these with another creeping plant, which likewise produces a fruit of very great size. This is

THE STRAINER.

This is more a huge pod than a fruit, and might by some persons be placed in the category of monster Beans. The Strainers are from 12 inches to 24 inches in length, and in the widest part 6 inches or 8 inches in diameter. The outer skin of this enormous pod is thin, but when this is removed the formation of the interior is most curious. The whole is a network of fibre most beautifully and finely arranged. These fibres are so closely interwoven one with the other that even wine might be strained through them; their name of Strainer arises from their being sometimes used for this and similar purposes. When the Strainer is divided the inner part is found to be rather hollow. There are ridges of the same fibre which pass down the sides in regular order, and in these

ridges are black seeds by which the plant is propagated. They are often turned inside out, and in this state most beautiful baskets and other ornamental works are made from them.

(To be continued.)

THE KITCHEN GARDEN.

CABBAGES.

LATE podding of Peas, for the long spell of cold and rain has checked this process very materially, combined with the comparative scarcity of Cauliflowers and other green vegetables in the market, have all helped to render Cabbages in great demand; indeed, but for them we should be short indeed of vegetable food. That such is the case helps greatly to emphasise the value of Cabbages as hardy spring vegetables. Happily we have largely got rid of the large heads that were once so much grown. In such varieties as April, Ellam's Flower of Spring, Defiance, First and Best, London Market, and others we have capital stock, that, by making two or three late summer and autumn sowings and plantings, give a plentiful supply of quite delicious hearts from March to midsummer. If a sowing be made in a frame in October, and the plants when strong put out in April following, it is easy to have Cabbages all the summer. Happily by the end of June we may hope to have Peas and Beans in abundance. A. D.

SEEDS WHICH SHOULD BE KEPT.

I HAVE taken the following passage concerning Gilliflowers from a book published without the author's name in 1765:—"Some amateurs, and even some expert gardeners, assert that the seed of the Gilliflower, when kept for five or more years, produces more plants with double flowers than new seed does. Supposing this to be so, the reason is that seeds which are only good for the production of single blossoms lose their vegetative force sooner than others, from which it follows that a sowing of old Gilliflower seed would produce a smaller number of plants but a greater proportion of double flowers." What credit ought we to give to this opinion of nearly two centuries ago? According to a belief which has been transmitted from generation to generation it is better to use seeds of from two to five years old (according to the species and variety) for certain leguminous and floral plants. Why? Old gardeners have told me that new seeds produce plants which are not so well formed, which rapidly run to seed and are too vigorous to maintain their characteristics, while from seeds two or more years old the plants are more regular in form, and running to seed is less to be feared, &c.

Every plant, generally speaking, has the property of reproducing itself with its characteristics by seeds, but at the same time it is liable to revert to the specific types. Therefore in the seed of a plant perfected by culture two forces oppose each other, the one tending to revert to the primitive type, the other tending to the reproduction of certain acquired characteristics which selection has fixed. It is quite possible that this force of atavism weakens with age, as does also that anomalous vigour which causes the progeny of some seeds, when sown soon after gathering, to run at once to seed. It is not the same, however, with Gilliflowers. If we admit that doubling in these is weakening, it is easy to believe that a seed several years old does not possess its first vigour, and may produce double instead of single flowers. It would be here a question of a real transformation in the seeds, a transformation which may be admitted when it is remembered that the less Gilliflowers are left to themselves the more plants will they produce with double blossoms. It is for this reason that in Germany they are grown in pots, and by this means a much higher percentage of plants with double flowers is obtained than when they are grown in the open ground.

But it is with culinary vegetables that it is

especially necessary to know whether to choose new or old seeds. Thus for Beetroot and Carrots only seeds two years old should be used in order that the root may be better formed and that too much "top" will not be made; in the same way for Endive and Cabbage seed three years old should be employed. If it is desired that Spinach, Lettuce, and Radish should not run to seed or change from the type seeds two years old must be used. For Corn salad it is indispensable to sow seed at least one year old, for the seed gathered in June scarcely comes up at all when it is sown in the following September or October. In *Le Bon Jardinier* of 1829 it is recommended in the sowing of Melons to choose seeds several years old; and it is the same for other cucurbitaceous plants. For early sowings of Turnip it is equally necessary to use seeds several years old in order to prevent the plants running to seed.

Thus the influence of time upon seeds appears to be well established, and it is not possible, perhaps, to account for this in any other way than by the suppositions we have advanced.

JULIUS RUDOLPH, in the *Revue Horticole*.

Ipomoea rubro cœrulea.—This singularly beautiful climber I saw flowering most freely and effectively the other day in one of Lord Onslow's greenhouses at Clandon Park. There were six plants, each in a 6-inch pot, raised from one of Sutton and Sons' packets. A more lovely climber for such a purpose it would be hard to find. The gardener, Mr. Blake, had run some wires along each side of the centre alley, and the plants were placed on top of the side walls, with their growths trained erect and laterally. All the plants were in profuse bloom, the flowers large, of perfect *Convolvulus* form, and in colour pale or soft blue with thin reddish bars. This is one of the greenhouse plants that everyone having a house can grow and be delighted with. The plants evidently flower over a long season. It would be interesting to learn whether anyone has tried it outdoors. What a glorious thing it would be to intermix with one of the scarlet climbing *Tropæolums* on a warm wall.—A. D.

Two useful West Indian plants.

To those who cultivate the several species of edible *Passifloras*, the following note from the *Trinidad Bulletin* as printed in the *Agricultural News* will probably prove interesting: "*Passiflora laurifolia*, which is known as the Bell Apple, is commonly grown in many of the West Indian Islands. In Trinidad it requires to be cultivated well in the open and on trellises so that it may get plenty of sun. The fruit is some 2½ inches to 3 inches in diameter and almost globular, turning from green to a bright yellow on ripening. The outer skin is spongy and leathery, and the contained pulp is in flavour and consistency much like the interior of a large sweet Gooseberry, which it surpasses in flavour. It is eaten by paring away a part of the apex, then squeezing the fruit, or by cutting in halves and using a spoon. Care should be taken not to eat any portion of the rind, as most of the *Passifloras* possess an emetic principle which is slightly developed in the fruit-skin of this species, and children are sometimes made ill from this cause. It is an excellent fruit, and well worthy a place at dessert. It is commonly sold in the markets of the Windward Islands. From the same source as the foregoing is obtained we find the following curious note on what is called the Hat-stand Tree, a name which is said to be given to *Rheedia lateriflora*. It is common in the woods of Trinidad, and is noted for its regular branching character when small. It is frequently cut and placed in a heavy base and used as a hat-stand. A small tree of 8 feet or 10 feet will often have as many as twenty or more branches of even size thrown out at regular and close intervals at an angle of 45° from the main stem. These when shortened into a pyramidal form and nicely trimmed and polished serve exceedingly well for the purpose. If the main stem is further provided with rings about 20 inches from the base for umbrellas and a draining trough fixed it may be made still more useful.—JOHN R. JACKSON, *Claremont, Lympstone, South Devon*."

CARSON'S PLASTINE.

A PLASTIC, DURABLE, GLAZING COMPOSITION.

Withstands exposure to heat and moisture on Forcing Houses, Conservatories, Frames, etc. Supersedes Genuine Linseed Oil Putty.
SOLD IN KEGS, 28lbs., 56lbs., and 112lbs. each. Price 16s. per cwt. 2 cwt. and upwards delivered carriage paid.

"VITROLITE."

A PAINT SPECIALLY PREPARED FOR HORTICULTURAL WORK.

Durable, Elastic, will not Flake or Scale, Dries with an Enamel Surface.

WHITE, AND STONE COLOUR, 7s. 6d. per gallon. Mixed ready for use. 8 gallons and upwards delivered free.

FULL PARTICULARS SENT ON APPLICATION.

"BITTER OIL" INSECTICIDE.

FROM ALL SEEDSMEN.

Tufted Pansy Bullion.—"D. B. C." speaks appreciatingly of this fine yellow kind, a fact that greatly interests me. It must be sixteen years since I first began to draw attention to the many good qualities of this Pansy as a free, early, and continuous flowering variety. I got it originally from the late Mr. William Dean when at Walsall. Mr. Dean, who first got it from the late Mr. Baxter of Daldowie, sent me plants in April with many others to form a collection, and in the August following was himself much surprised to see the mass of bloom that remained. In short, it was a gem dwarf, sturdy and vigorous in growth, hence its great profusion in flowering. Bullion is one of the true tufted Pansies, spreading into verdant masses of green covered in the proper season with golden flowers. I think the back numbers of THE GARDEN will also bear witness to the fact that it was hardly ever without buds or blossoms in our Hampton soil. One instance in particular is still quite fresh in my mind. One February or thereabouts the entire stock of this variety and the autumn cuttings in particular were bristling with flower-buds, but there came a heavy fall of snow which hid them from view for some time. But the buds expanded into golden masses soon after the snow had gone.—E. J., Hampton Hill.

Clerodendron fallax.—This, one of the best of the shrubby Clerodendrons, is a native of Java, and is usually regarded as a stove plant, the fact that it will thrive in a much lower temperature being very generally overlooked. At Kew it is used during the summer in the greenhouse, and in such a structure not only are the flowers more appreciated than in a higher temperature, but they also last considerably longer. It is readily propagated, both by cuttings and seeds, and in its after culture the principal consideration is to obtain good sturdy plants that do not require stopping, but will each produce a large terminal corymb of scarlet flowers. Though no artificial heat is needed during the summer, in the winter an intermediate temperature is required. This Clerodendron is a liberal feeder, and thrives well in a mixture of two-thirds good fibrous loam to one-third well-decayed manure or leaf-mould, and a little sand. When well rooted weak liquid manure occasionally is beneficial. For plants carrying one head of flowers, pots 5 inches or 6 inches in diameter may be used, but larger specimens will, of course, require a corresponding increase in the size of the pots. A very fine Clerodendron belonging to this section is *C. myrmecophilum*, a comparatively new species, with orange-amber coloured blossoms. It is a native of Singapore, and was a short time since noted in THE GARDEN.—H. P.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—H. J. A.—The plants are: 1, *Kalosaurea coccinea*; 2 was quite withered; 3, *Lilium croceum*; 4, *L. Martagon*, but the flower had fallen to pieces; 5, *Escallonia macrantha*; 6, *Veronica spicata*; 7, *Lychnis coronaria*.—M. P. Forster.—*Lotus tetragonolobus* var.—S. H. B.—*Collomia grandiflora*.—E. B. S.—*Campanula rhomboidalis*.—*Belbroughton*.—The small flower is the polyanthus variety *Blanche Rebatel*, and the Tea Rose *Souvenir de Mme. Pernet*.—C. E. F.—1, *Acer Negundo*; 2, *Leukovda acuminata*.—T. B.—Your *Rubus* is a true species, *R. nutkana*, a native of North America. Seeds must have been carried by birds or by some other agency.—Mary H. Calvert.—*Alyseum argenteum*, *Dianthus viscidus*, the white woolly-leaved plant is *Stachys lanata*.

Lilium giganteum (M. P. BONAQUAT).—For the time being, or as soon as the flowering is over, all that can safely be done is to water freely either with clear water or weak liquid manure, such as soot and cow manure mixed

together in a coarse sack and placed in a large tub or water tank. The liquid from this may be given twice a week, and a good soaking each time. This will assist the offsets to develop fully, and may be continued as long as any green leafage remains. In early autumn dig up and divide the offsets, planting them to form a large group, say, of a ground area of 3 feet or more, depending on the number and size. It would be better to find a place apart from the old flowering site, and by deep digging, heavy manuring, and the like prepare a place for the young bulbs. It will largely depend upon the treatment these youngsters receive whether they will be three, four, or five years before reaching the flowering size. Some prefer to pot these small offsets, but it is not really essential to plant them out in spring.

PENTSTEMON VIRGATUS.

The only gain in so doing is the foliage may escape the late frosts. By planting in a well-nigh western exposure rear from frost is reduced to a minimum.

Pentstemon virgatus (M.).—This is a very interesting Pentstemon. Write to Mr. Smith of Newry about it.

Fertilising Malmalson Carnation Nautilus.—The fertilisation of Malmalson Carnations is not an easy matter, and it would not be safe to leave it to the agency of bees. As in all double flowers, pollen is very scarce, and it requires some care to fertilise by artificial aid. A small camel-hair brush may be used, the pollen collected on this and then applied to the stigmas of the flowers. Many flowers may have to be searched before much pollen can be found, and then in some flowers the stigma and ovary may not be perfect. The flowers must be quite dry when fertilisation is attempted, the best time to do it is about midday in bright sunny weather. The same flowers should be gone over several days in succession. Malmalsons are the most difficult of all Carnations to get seeds from, and with some of the varieties it seems impossible to get perfect seeds.

Carnation rust is a very difficult pest to eradicate; there are several preparations which, if used persistently, may effect a cure. Gribble and Reason's "Carnum," or Outram's "Carnation Disease Antidote" may be recommended. Either of these preparations may be obtained through most nurserymen, and full directions for their use are given with the articles. The compost for potting should consist of good fibrous loam and leaf-mould, to which may be added a little bone-meal and a good sprinkling of sand, or if the loam is heavy some fibrous peat may be added. Many growers use peat freely, but we have seen equally good results where the soil has consisted mainly of yellow loam. It should be made fairly firm when potting.

Lilium candidum disease (T. F. A.).—The specimen of *Lilium candidum* that you forwarded was attacked by the Lily disease, caused by a fungus known as *Botrytis cinerea*. Unfortunately, it has proved a most destructive pest to certain Lilies for the last few years. Any plants that are very badly attacked I should at once cut down and burn. Those that are not so badly infested should have all the leaves that show any signs of the fungus picked off and burnt. The plants should then be sprayed with sulphide of potassium (1 oz. in 2½ gallons of water) or Bordeaux mixture. The ground round the plants should also be thoroughly wetted with one of the above mixtures, and in the winter it would be useful to remove about half or three-quarters of an inch of the surface of the soil round the bulbs and bury it deeply. Keep a good look out next season for the disease, and as soon as the first signs of it are seen remove the affected parts and spray the plants.—G. S. S.

Tomato disease (T. LESTER).—Your Tomatoes are attacked by a fungus commonly known as the Tomato black rot fungus (*Macrosporium Tomato*). Gather all the infected fruits and burn or bury them. Then spray the plants with sulphide of potassium (1 oz. dissolved in 2½ gallons of water) or Bordeaux mixture. Keep the house well ventilated and do not force the plants too strongly. This pest generally finds its way into the fruit through some crack or wound in the skin. Another season as soon as the disease shows itself destroy the infected fruit, and spray with the above mixture every ten days, until there are no more signs of the fungus.—G. S. S.

Garden Roses.—Are the following Roses good hardy garden varieties, autumn bloomers, and free? Jeannie Dickson, Mrs. Cocker, Pride of Waltham, and Souv. de Mme. Verdier? Do you know anything about Robert Scott?—CONSTANT READER.—(Jeannie Dickson, Pride of Waltham, and the hybrid Tea Souvenir de Mme. Eugène Verdier are good autumn-flowering Roses. The two first are perfectly hardy, and the last named may be planted without hesitation, as it is an easy matter to earth up the base of the plant to protect it in winter. Mrs. Cocker is quite hardy, but is not a very good autumnal. Robert Scott is a grand Rose. It will surpass Her Majesty as a garden variety. The flower is not so massive, but the plant blooms freely, and every flower is so perfectly developed that it is sure to become popular.—ED.)

Roses with curled foliage (R. W.).—We believe this curling of the foliage to be attributable to cold nights followed by excessively hot days. It is intensified if there is dryness at the root. If the plants' requirements are seen what forestalled in this respect we think you would experience no trouble. Climbing Roses upon walls require more moisture at the root than Roses that are planted well in the open, and they should be watered at least once a week beginning at the end of May.

Making small shrubbery (N. O. O.).—The following shrubs would be suitable for your shrubbery. Of those you mention *Spiraea*, *Anthony Waterer*, *S. Indragens*, *S. media*, *Cytisus scoparius* and varieties, *C. albus*, *C. praecox*, *C. purpureus*, *Double Gorse*, *Lilac* in variety; also the following: *Rambling Roses* *Electra*, *Una*, *Crimes Rambler*, *Psyche*, *Helene*, *Pink Roamer*, *Mrs. Anthony Waterer*; also *Rosa rugosa* and varieties, and *Rosa spinosissima* and varieties, *Berberis vulgaris*, *B. stenophylla*, *B. Darwinii*, and *B. Aquifolium*, *Spiraea arguta*, *S. Thunbergii*, *S. Douglasii*, *Cotoneaster frigida* and *C. buxifolia*, *Cornus alba* var. *Spethii*, *Prunus spinosa* var. *fl.-pl.*, *Viburnum Opulus* var. *sterile*, *V. tomentosum* var. *plicatum*, *Myrica Abel Carriere*, *Aesculus parviflora*, *Ligustrum lucida*, *L. sinense*, *Rhus cotinus*, *Neillia opulifolia* var. *lutes*, *Pyrus floribunda*, *P. spectabilis*, and many other things.

TRADE NOTES.

A NEW CELERY CLASP.

MESSES. LAING AND MATHER, Kelso, N.B., have sent us a very simple contrivance for clasping Celery when earthing this up. Although so simple (it is just a spring metal clasp that may be closed so as to form a circle of either 3½ inches or 4 inches diameter) it will undoubtedly prove most useful and effective, and save a good deal of labour in the tedious garden work of earthing up Celery. The fastening of the clasp is effected by a stud on one end being adjusted into a notch on the other. Messrs. Laing and Mather say: "The purpose of the clasp is to avoid the tedious labour of tying. It is not necessary to clasp the whole row at once; one or two dozen may be clasped and earthed up at a time, and when these are done the clasps are drawn upward off the plants, unfastened and applied to the remainder."

MESSES. DICKSON'S SUCCESSORS.

WE are pleased to observe that Messrs. Dicksons, the old Chester firm, have recently been awarded three gold medals for superb displays from the extensive collections in their nurseries. Their exhibits formed chief features at the above, and the gold medals awarded were at the celebrated York Gala held last month; the Horticultural Fête in Hareley Park (Staffordshire), on the 1st and 2nd of the present month, and the Wolverhampton Floral Fête on the 7th, 8th, and 9th also of the present month.

THE GARDEN

No. 1654.—VOL. LXIV.]

[AUGUST 1, 1903.]

DECORATIVE GARDENING AND HORTICULTURAL SCIENCE.

OUR excellent contemporary, the *Gardeners' Chronicle*, in the issue of the 25th ult., page 58, tells a somewhat woeful tale of our horticultural shortcomings, and the same opinion is held by many of the thinking men in this country. America is certainly "taking the lead in the development of scientific horticulture," but it is somewhat surprising to read our contemporary's opinion that perhaps that country may be considered to be also taking the lead in "decorative gardening." From what comes daily to our knowledge it is apparent that there is an extremely lively and intelligent interest taken in pleasure gardening in the United States. Important new gardens are being made and money is being lavishly spent, but for the most part the results show rather the tentative or experimental spirit than the sure hand.

A great effort seems to be made to secure decorative objects from Italy or of Italian design. In some of these gardens these have a strangely exotic appearance, as if they refused to be acclimatised. The happiest of these new gardens in which architectural features are introduced are those in which, following the traditions of the good eighteenth century houses, a restrained use of the Doric column and its accessories is made in piazza, pergola, and sundial-shaft.

We make plenty of mistakes of the same kind in England; indeed, the effort to be Italian, even in the best-designed examples, has about it something cold and uncongenial when it has passed through the Anglo-Saxon mind and is planted out in our climate. We, and those of our blood in the New World, can abundantly appreciate and reverence those great masters of garden decoration, whose gardens, even in their decay, we visit with humble admiration, but we should remember that in the Middle Ages decoration was a traditional craft in closest touch with all that was best in the fine arts. It was then in the Italian blood, and it came out in easy, almost unconscious practice, in a way that we can never again hope to attain.

We sympathise entirely with those who feel the strongest attraction to these various objects of ornamental art that were such fitting adjuncts to the old gardens of Italy.

But it is difficult to marry them to our northern gardens. These have other possibilities of delight and beauty that may be achieved without strain, and it is these simpler ways that we urge all garden-lovers to seek for and to practice.

Very true is it that "we must not delude ourselves into the idea that practical gardening and gardening amenities are everything, and that we continue to stand very high, and to take the first place in them." We hope devoutly that when the Horticultural Hall is an accomplished fact, the Royal Horticultural Society will devote itself to a garden for practical and scientific horticulture, as we believe is its intention. Our contemporary unkindly remarks that the trials at Chiswick are laughed at by the great commercial houses. This was not so in the time of Barron, and there is no reason why it should be so now under Mr. Wright, when the society has a garden in the country where experiments and trials can be conducted under greater advantages than exist in a suburb of London. The trials have been independent, and in a measure set forth the work of the hybridist in improving existing races.

We hope the day is long distant when the Royal Horticultural Society will give up its practical work, which has such a direct and important bearing upon one phase of the great horticultural industry. But we are in full agreement with our contemporary that the Royal Horticultural Society should in due time possess a scientific department of its own, now represented by the scientific committee, which seems to sit to answer a few commonplace questions addressed to them by the Fellows. Professor Beach's proposal that there "be organised a society for horticultural science to fully establish horticulture on a scientific basis" should not pass unnoticed in this country. We are proud of our practical work, and we should be equally so of the scientific aspect; but that is certainly not a matter upon which we can claim the "pride of place."

EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree,

shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

EMBOTHRIUM COCCINEUM.

Mr. Reuthe, the Nurseries, Keston, Kent, sends flowers of this brilliant plant with the following note: "This is undoubtedly the most beautiful of hardy or half-hardy trees or shrubs, but is at present still very rare. A perhaps mistaken idea is that it is difficult to grow and is not hardy. In a certain sense both assertions are true, though these difficulties can easily be overcome. In the first instance the great majority of the plants sold are raised in greenhouses, or even temperate houses, and are sold as small plants, which have no chance of ripening the wood sufficiently to resist the winters. It should be, however, planted in spring or summer. Put in strong plants which have not been grown in a greenhouse, and plant in good, well-drained, but not too dry soil containing humus, and well protect from cutting winds and sun. They are quite hardy in Cornwall and Devon, where the plants are grown to perfection. Even here failures occur, unless attention is paid to the position and the plants are from the small seedling state treated as hardy. There are plants in gardens in the North of London, at Hampstead Heath, and elsewhere, and, though planted in what I call a most unsuitable soil, they have stood several winters out of doors, and seem to be as hardy as *Euonymus japonicus*. In Cornwall, owing to the extraordinary mild winter of this year, they were in flower as early as March, and the wintry weather in April and May, though checking them, did less damage to the flowers than to Horse Chestnuts or fruit trees, and they are still here and there in flower at the time of writing (the end of July). Planted in suitable soil and position the plants grow rapidly, soon forming a tree 20 feet to 40 feet high. Straggling shoots are cut back or trimmed, and it bears this treatment as well as a Willow or Poplar. *Embothrium coccineum* has two forms, one with long lanceolate pointed leaves, bright or deep green, and trusses of bright orange-scarlet flowers; the other and better form is more compact, with more acute leaves and deep coloured dazzling scarlet flowers, slightly later. As they are difficult to move it is advisable to procure well-established, pot-grown plants, but grown out of doors."

HIMALAYAN RHODODENDRONS.

Mr. Reuthe also sends flowers of *R. cinnabarinum* with the following note: "Although in exposed parts of the northern and eastern counties of Great Britain it would not be wise to plant the early-flowering species out of doors without good shelter, the later-flowering Rhododendrons are quite safe when properly treated, and are as hardy as the hybrids. Care must, however, be taken to shelter them entirely from violent winds, especially north and east, and from the early and midday sun, and, like other Rhododendrons, they refuse to grow in limestone soil, but must have a certain amount of humus and be fairly moist without being boggy. Many species seem to grow well under tall deciduous trees intermixed with Pines in a half-shady position, and the falling leaves of these trees are a protection to the surface roots. The best time for transplanting is during

the months from September till March, but under favourable climatic conditions and position they can be transplanted the whole year round. The following are a few of the best of these handsome shrubs:—

Arboreum.—This makes a handsome, well-furnished bush, the foliage varying from bright green to pilose, either green, silvery, or golden yellow beneath, and with trusses of large, rosy, pink-red, whitish, or purple-coloured flowers.

Barbatum.—Bright green foliage, the stalks furnished with hairs, and large trusses of deep red or crimson flowers.

Aucklandi.—Very easily distinguished by its long, acute, light or pale green foliage and stalks, and large trusses of handsome white or white-tinged rosy flowers.

Manglesi.—A similar species, with white flowers tinged with a rose colour, and the interior of the upper petals spotted red.

Thomsoni.—This has thick ovate leaves, glaucous when young, and medium-sized crimson flowers.

Shiloni.—A cross between *R. barbatum* and *R. Thomsoni*, and one of the most showy of all *Rhododendrons*. It approaches more *R. Thomsoni* than *R. barbatum* in foliage, but the flowers are dazzling crimson.

Campylocarpum.—Small, light green foliage and medium-sized pale yellow flowers.

Cinnabarinum has almost the same foliage of a dull green, ferruginous beneath, and trusses of long, almost tubular flowers, orange tinged with bronze and tipped with pale yellow. It is one of the last to bloom, flowering from May till August.

Roylei.—This has ovate, bright, glaucous green foliage, especially when the foliage is young. From June till September the foliage is as attractive as the flowers, which are of medium size, deep crimson-purple.

Glaucum has small, glaucous foliage and pretty but small trusses of lilac flowers.

Falconeri.—A noble plant with immense leathery foliage, dull green and yellow, woolly beneath. The leaves sometimes attain a length of 2 feet to 3 feet, and are 3 inches to 5 inches broad, with large trusses of lemon flowers.

Excisum has the appearance of being only a form of *R. Falconeri*. The young leaves are woolly and cinnamon-coloured, and the large flowers pale yellow, tinged and spotted with purple.

Most of the above types flower freely and are easily fertilised by insects, producing some interesting forms.

DISA CLIO.

Those who visited the Royal Horticultural Society's Holland House show in June will probably remember having seen a remarkably fine hybrid *Disa*, shown by Sir William Smith Marriott, the Down House, Blandford, Dorset. Sir William has kindly sent us flowers of this new Orchid, which was raised in the gardens at the Down House. The blooms sent are large, the two lower segments are a rich rose colour, while the upper one is lighter. Each of the racemes sent bore three flowers. The parents of this hybrid *Disa* are *D. grandiflora* and *D. Veitchii*. We shall give a small illustration of it next week.

[Several notes are left over until next week.]

FLOWERING OF THE BAMBOO.

As the flowering and seeding of Bamboos in this country has recently attracted some attention, a note upon the subject may be of some interest at the present moment. In a Gloucestershire garden, where all the Bamboos known to be hardy are cultivated, several species have flowered during the last few years.

Arundinaria Simoni flowers and seeds every year, and is none the worse; *A. Laydekeri*, which is perhaps only a variety of *A. Simoni*, does the same. From both these Bamboos

ripened seed has been obtained, from which young plants have been raised.

Bambusa (Arundinaria) auricoma flowered sparsely three years ago; seed was not observed. The plants did not suffer. Last year and the year before *Phyllostachys nigra* and *P. nigro-punctata* flowered profusely. No seed was found, although careful search was made. All the culms which flowered died down to the ground. In one plant of *P. nigra* all the culms flowered and died, but this year new culms have appeared from the rhizomes, and the plant, though enfeebled by the vain endeavour to reproduce its species, has a healthy appearance, and looks like growing into its former stature in course of time.

Messrs. Rivière, in their monograph "*Les Bamboos*," cite similar behaviour on the part of *Arundinaria japonica* (Métaké) and *P. flexuosa*, and now from Ceylon there comes the news that the huge *Dendrocalamus giganteus* flowered two years ago and the culms apparently died. But it was no real death, for the same culms put forth leaves, feebly it is true, the following year, and are now in full beauty again.

It is evident, therefore, that botanists and travellers have been in too great a hurry in declaring that the Bamboo necessarily dies after flowering. Their observations were incomplete. It is quite possible that some of the caespitose Bamboos may find their death in seeding. Some are really annuals, and of course die when they have fruited. But all the evidence derived from close observation during these last years goes to prove that our correspondents, who write in so melancholy a strain, need not put on mourning every time that they see a sign of flowering in their cherished plants.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

August 3.—Lady Algernon Gordon-Lennox's Cottage Garden and Amateur Horticultural Competition at Broughton Castle.

August 4.—Royal Horticultural Society's Committee meet.

August 11.—Clay Cross Flower Show.

August 12.—Bishop's Stortford and Salisbury Horticultural Shows; East Anglian Horticultural Club Meeting.

August 19.—Shrewsbury Floral Fête (two days); Eastbourne Flower Show.

Royal Horticultural Society.—The next fruit and flower show of this society will be held on Tuesday, the 4th inst., in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. Special prizes will be given for Cactaceous plants. A lecture on "Landscape Gardening" will be given by Mr. H. E. Milner, V.M.H., at three o'clock. At a general meeting of the society held on Tuesday, the 21st ult., thirty-six new Fellows were elected, among them being Lady Arthur Hill, Lady Margaret Cecil, Sir Philip Magnus, and the Hon. Gerald Ponsonby, making a total of 1,045 elected since January 1.

Jubilee of Messrs. J. Veitch and Sons.—In order to celebrate the jubilee of the establishment of a business in London (Mr. James Veitch, jun., having come to Chelsea in 1853), Messrs. James Veitch and Sons, Limited, have presented to the Royal Horticultural Society five silver-gilt cups of the value of fifty guineas each. This liberal offer has been accepted by the council

and the following conditions drawn up: The cup will be known as "the Veitchian Cup," and one will be awarded once a year to the best individual exhibit in the opinion of special judges at the Temple shows of 1904, 1905, 1906, 1907, and 1908, or any other leading show held under the direction of the society the council may determine. The successful exhibit may be either a single plant, a group, a novelty, or an example of culture. The cup will become the property of the winner each year, and he will be required to make a declaration that the exhibit is his own property, and has been cultivated by him for fourteen days previous to the show. The judges are to be seven—three amateur gardeners, and two nurserymen or seedsmen—to be selected by the council. No exhibitor can win more than one cup.

Exhibition of edible fungi.—On Tuesday, September 15, the Royal Horticultural Society will hold an educational exhibition of edible fungi in the Drill Hall of the London Scottish Volunteers, Buckingham Gate, Victoria Street, Westminster, and a lecture upon them will be given by Dr. M. C. Cooke, M.A., V.M.H., &c., at 3 p.m. All interested in extending or acquiring the knowledge of the edible species are invited to send collections. Collections should, if sent, be delivered at the Drill Hall, on Monday afternoon, September 14, or, if brought, should arrive at or before 9 a.m. on the Tuesday, so that they may be properly grouped and arranged by the fungi specialists. Collections should consist of any fungi supposed to be edible. Each specimen should be wrapped separately in thin or tissue paper, and packed so as not to get loose or shaken in transit. When the names are known by the senders they should be neatly written on a card and enclosed, but if not known they will be named by the experts. The society will pay the carriage of all collections and will award medals according to merit. The best collection will be considered to be that which includes the largest number of edible species shown in the best condition. When the senders are doubtful as to whether any of the specimens are edible or not the matter will be determined by the experts. Unnamed collections will also be examined, named, and sorted into edible and poisonous by the experts as far as their time will permit. All specimens will be destroyed at the close of the meeting unless removed by the senders. Intimation of an intention to exhibit should, if possible, be sent a few days before to the secretary, Royal Horticultural Society's Office, 117, Victoria Street, London, S.W.

The new curator of the Birmingham Botanic Gardens.—I was very pleased to read your kindly note in last week's GARDEN about the new curator of the Birmingham Botanic Gardens. It is always a delight to find men of Mr. Humphreys' quiet disposition and sterling worth recognised in an age of bustle and much wasted energy. The Royal Horticultural Society loses by his departure, and Birmingham gains, and I hope the new curator will place the gardens upon a firm botanical and scientific basis. His knowledge of exhibitions will stand him in good stead, but Mr. Humphreys' work in the arboretum at Kew as the propagator of trees and shrubs must not be forgotten. As you say, the Birmingham committee have made a "wise selection," and I hope, in face of the difficulties I am told that have to be encountered, he will have the support and sympathy of those who control the finances of the garden. —A. [We are glad to print this letter from one of the new curator's old friends. We have ourselves profited much by Mr. Humphreys' knowledge of trees and shrubs. As we said last week, he has our heartiest goodwill in his new office. Mr. Humphreys is thirty-five years of age. He began his new duties on October 1.—Ed.]

Strawberry Eleanor in July.—This is still the best late variety we grow, but at the same time it is by no means of first-rate flavour. It is also known as Oxonian, and must have been grown many years under the latter name, as I found it was very well known in the West of England under that name at least twenty-five years ago. After trying most varieties for a late

apply we still have to rely upon this. The plant bears very fine fruits and is a heavy cropper; it continues to give successional crops, and, though a little acid in flavour, it is not inferior. No one can compare it with a British Queen, but how few grow the last-named to perfection, and in this respect the same remarks apply to Laxton's Latest of All and some of the Pine varieties; they are not late enough in some cases, and in others the soil is not suitable. Eleanor is a very hardy variety, a free grower, and may be relied upon in poor soils. I once saw it grown in cold frames and never saw such a splendid crop in June; but my note only concerns its value for last supplies in the open ground. The plant needs ample space owing to its free growth, and it certainly greatly extends the Strawberry season.—S. H.

Defiance Cabbages.—It is to be regretted that seedsmen multiply duplicate names for varieties of such useful and comparatively permanent things as some vegetables are. A correspondent last week referred approvingly to Daniel's Defiance Cabbage. I have not grown it, but have heard of it as a rather large variety. I have grown frequently and have often seen Cannell's Defiance, which has been with me one of the most perfect of all Cabbages, not large, but quick hearting, medium sized, and very handsome. For two years I grew this Cabbage on trial plots for manures at Surbiton, and in each one of the seven plots it was first-rate, and by the allotment holders greatly admired. This year I have for the same purpose London Market and First and Best, both out of a London market garden. These are larger, much more leafy and irregular, and much inferior to Cannell's Defiance. We do not want large Cabbages in gardens. They are too leafy and need so much cooking to soften them for table. It is to be wished that names of all vegetables should be dissimilar that mistakes as to varieties may be avoided.—A. D.

Preserving Strawberries.—I am glad to see that these still hold their own wherever their merits are known, and are of far greater value for preserving. I recently saw some acres of the "old scarlets" as they were termed, which the grower told me were far more profitable than large sorts, as one firm secured the crop. This is not much grown in private gardens, but it is a splendid cooking fruit; it retains its shape, and has a distinct Pine flavour, but it is only fair to add that many gardeners grow the well-known Vicomtesse H. de Chury, as the first fruits may be used for dessert and the second sized fruits for preserving; the jam is a rich colour, and the fruits remain whole. This variety rarely fails to crop freely even in adverse seasons. I am aware many mix their Strawberries and preserve large fruit, but the jam bears no comparison to that produced from the smaller sorts, such as Grove End Scarlet or Vicomtesse and other small fruited of the Pine section. In most gardens it would well repay to grow a quarter or preserving alone. The older generation of housekeepers who prided themselves on their jams would, I know, make short work of the large soft fruits now so often made into jam, and often, to give colour, added Red Currant juice. The preserve was very fine.—G. WYTHES.

Railway station flower gardens. How often when travelling have our eyes been delighted with beautiful glimpses of flowers, and now we have noticed capital sites for flower gardens at countryside stations unoccupied for want of someone to move in the matter. Our station at Great Glen (Midland Railway), near Leicester, afforded a good opportunity of embellishment. The line runs north and south, and the wayside station is in a shallow cutting, the whole length of the platform being bounded with a close wood paling, hiding the grassy bank behind it. After some correspondence the railway company kindly removed the fence and sent many loads of stone slag and trucks of earth to the station. I was able to direct operations, and with my gardeners built sloping out crops of rock to imitate strata so as not to offend the geological eye, while keeping the bank up and forming terraced beds, which were filled in over the red clay with good soil. The station-master, who is an enthusiastic lover of flowers, and the porters

all gave a hand, and the result is a very creditable rock garden. We took the turf off and laid out the whole of the sunny south bank, but the north shady bank we only half stripped of the turf and put the rocks at the bottom and ends only, as it made too much garden for the station-master to look after. Several of the gentry round took an interest in stocking the garden, and sent quantities of herbaceous roots. We find that masses of flowers of one colour are most effective, and although the bank is rather hot and dry, yet the flowers give pleasure to travellers. Crocus, Daffodils, and Tulips in spring, Wallflowers in masses, German Iris, Pansies, Campanulas, Poppies, Veronicas, Sedums, and a host of herbaceous flowers made the banks gay. A rather effective display of flowers is seen at the next station, Wigton, the station before Leicester. A clay bank has been thrown up to hide the railway from the house, and small bushes of Gorse and a few Brooms were planted. The spaces between were scattered with Poppy seeds mixed. The multitude of Poppy flowers—scarlet, pink, and other shades—have been very beautiful and worthy of imitation. When travelling through Norfolk lately I could not but notice the masses of Broom growing naturally on the railway banks. The light soil of Norfolk suits the Gorse, but our red clays are too cold. Our banks just now are gay with the white Dog Daisy, and occasional patches of yellow Trefoil. What a great pleasure it would give to travellers if our railway banks were rendered more ornamental by masses of strong-growing wild flowers! Masses of Primroses sometimes delight the eye in spring. If we had similar masses of summer flowers it would add greatly to the beauty of the railway banks. In some parts Gorse and Broom seed could be scattered, in other parts Forget-me-not would look well. Mixed Poppy seed, Valerian, or Foxglove would thrive well, and a host of other seeds could be tried according to soil and situation. The consent and aid of the railway companies must be enlisted, and care must be taken not to interfere with the view of the signals; but I think there is a great opening for beautifying our railway banks and adding to the interest of railway travel. If the matter is thought of sufficient interest perhaps others would give some further advice in THE GARDEN.—THEODORE WALKER, F.R.G.S., *Glen Hall*.

The season in India.—This year has been an exceptionally favourable one for fruit generally, but for Mangoes in particular. The Calcutta market is flooded with all sorts of Mangoes of very fine quality such as we have seldom seen. The delicious Langra Mango is very abundant, likewise the Bombay, the Kishenbhog, and many others. What we call the "hot season," which extends from March to June, and which has now terminated on the arrival of the monsoon, has been a record one in many respects. Plant life in lower Bengal generally, and in Calcutta gardens specially, has suffered much. It has been one of the hottest and driest on record, resembling the dry, hot season of North-West India, with its hot winds. In the Royal Botanic Gardens, Calcutta, the mortality among plants, both in and out of doors, has been very great, many rare and valuable plants having perished.—*Indian Planting and Gardening*.

Sweet Pea Dorothy Eckford.—This is a beautiful new variety, quite eclipsing all the other white sorts now in commerce. From eight seeds I have two grand clumps, and the flowers stand out above all other white varieties. The plants grow away freely, and, as evidence of their robust growth, they are developing quite freely, on long, erect flower-stalks, flowers of large and handsome proportions. No one who has seen or grown this new sort will have the same regard for Blanche Burpee or Sadie Burpee that they have had since those sorts were first distributed. The new sort is bound to supersede the older ones in popularity. The tops of my plants were propagated some time ago, and they are now beginning to bloom.—D. B. CRANE.

Humeas affecting Peach trees.—For the past three years we have noticed a disease-like effect on some Peach trees grown in a case, in

which there has also been grown for some period a batch of Humeas. Several theories have been advanced as to the cause of this mischief, fumigating, insecticides, bad stocks, and several other things having been mentioned as the cause. This year insecticides have not been used, but still the same effects are visible. It occurred to me whether the Humeas had anything to do with it, so we placed some plants in several different houses in contact with the Peach trees, and the results have all been identical. The effects are first noticed by the curling and browning of the young leaves, similar to the results of a scald. The browned patches eventually drop out, leaving the leaves perforated with holes. This must undoubtedly injure the prospect of a successful crop the following year. It would be interesting to know if any of your readers have had similar experience.—E. HARRIS, *Frogmore*.

Crossandra undulæfolia.—When first distributed by the late Mr. William Bull, of Chelsea, in 1881, this Crossandra was known by the specific name of *infundibuliformis*, which has now fortunately given way to the shorter and more convenient *undulæfolia*. It belongs to the order Acanthaceæ, but, though the arrangement of the flowers is a good deal in the way of many of its allies, in colour they are most conspicuous. This Crossandra makes an erect, half-shrubby growth, the upright stems being clothed with ovate acuminate leaves about 6 inches long, and of a deep shining green, with the wavy edges. The flowers, of which a continual succession is kept up from a terminal spike, are about an inch across, and of a rich orange salmon tint. Individually the blooms do not last long, but from the great number borne in succession from a single spike, its season of flowering extends over a lengthened period. Like most of its allies, the *Eranthemum*, this Crossandra cannot be flowered very freely when dwarf, as the pinching necessary to bring this about causes weak growth, and the object is to ensure good sturdy shoots, which bear the largest clusters of flowers. Cuttings strike root readily anywhere during the growing season, and a suitable compost for the plants is equal parts of loam and leaf-mould, with a good dash of sand.—H. P.

Helianthus Nuttallii.—The earliest Sunflower in English gardens is *H. Nuttallii*, and, as such yellow composites are estimated, it is fairly good as an ornament, not being exacting in its requirements. It grows about 3 feet high, with stems sufficiently pliable and substantial to resist the gales and rains of the last month in an exposed situation without tying. The flowers are golden yellow, 3½ inches across, and have about fifteen rather broad rays. The leaves are about 4 inches long, lanceolate, with a short winged petiole. It comes into flower at the end of June and lasts till September. The habit is running, but it is very easily restrained within bounds. It is a much better plant than *H. decapetalus*, which it might replace with advantage as an earlier flowering improvement. My stock came direct from Wyoming, and has been carefully verified.—C. WOLLEY DOD, *Edge Hall, Malpas*.

Glasgow and West of Scotland Pansy Society.—The annual exhibition of this society was held in the Trades Hall, Glasgow, on July 22. The competition was very keen in the Pansy and Viola classes. The chief prize winners were Messrs. Lister and Sons, Rothesay, who were first for forty-eight blooms and for six blooms of fancy Pansies; Mr. Charles Kay, Gargunnoch, was first for twenty-four blooms, for twelve blooms of fancy Pansies, for eighteen show Pansies, and six show Pansies; Mr. A. Allar, Campbeltown, was first for twenty-four show Pansies, twenty-four sprays of Violas, twenty-four blooms of Violas, a spray of Violas, and he also had the best show Pansy in the hall. Messrs. J. Johnstone, J. Sweeney, and J. Kirkwood were also among the prize winners. Messrs. Dobbie and Co., Rothesay, had a very fine exhibit of Pansies, Violas, and Roses.

Sweet Pea Lord Rosebery.—This is another new variety that deserves special notice, and only needs to be grown and compared with

other Sweet Peas to be appreciated at its proper worth. With so many other good things in general cultivation, I must confess that this new sort was taken in hand with a certain amount of prejudice in the spring of the present year. The plants are now making a display of which any grower may well be proud. The plants are growing strongly and developing handsome sprays of very large size flowers, with three flowers as a rule on each spray. Either for garden decoration or as cut flowers for vases, the flowers of this variety have a special charm, and for use under artificial light, more particularly when contrasted with some of the white Sweet Peas, their self-coloured rosy magenta blossoms are most effective. This variety may be regarded as a distinct acquisition to the already long list of named sorts, and should easily displace other older and less popular varieties.—D. B. C.

Tacsonia insignis.—This is conspicuous among the generally cultivated forms of *Tacsonia* by reason of the leaves being simple, or nearly so, instead of lobed, as in most of the others. These leaves are about 6 inches long, dark green above, and, in common with the young portions of the shoots, clothed on the undersides with a rusty tomentum. It is a native of the Andean region of South America, and, like many plants from that district, frequently fails to give satisfaction here, owing, probably, to the too dry atmosphere. Red spider are very frequently a source of trouble, and if unmolested they will often kill the plant, or, at all events, reduce it to such a state that it cannot recover. Having met with it so often in poor condition, I was extremely pleased, during a recent visit to Kew, to find it in a thriving state, and bearing several of its large pendulous violet-crimson blossoms. The specimen in question is planted out in the Mexican portion of the temperate house, where it is, apparently, quite at home. *Tacsonia insignis* is also interesting as being one of the parents of the comparatively new hybrid—*T. militaris*.—T.

Notes on the Agapanthus.—The African Lily (*Agapanthus umbellatus*) was introduced over two centuries ago, and still holds its own as a universal favourite. This is to a great extent owing to its accommodating nature, its free-flowering qualities, and the pleasing tints of its blooms, for those of a decided blue colour are always admired. In the favoured districts of Britain it is quite hardy, and even where this is not the case it may readily be wintered under the stage of the greenhouse if free from drip, or in a shed or frame, provided it is just safe from frost. Large masses in pots or tubs are very striking when placed during the summer in a prominent position, such as on a terrace or flanking a large flight of steps. It readily seeds, and individual forms have at one time or another been selected. The varietal names of *giganteus* and *maximus* have been applied to a selection from the type, but some individuals at least bearing one or other of these names are indistinguishable from the ordinary *A. umbellatus*. Some well-marked varieties are *A. u. albus*, a very fine *Agapanthus* and a good companion to the type, that is, if the best form is obtained, for there is a considerable amount of difference between plants bearing the varietal name of *albus*, as some have a light bluish tinge. One form, too, retains a few of the central leaves during the winter, as *A. umbellatus* itself does, while the other is quite leafless. *A. u. flore-pleno*: This has never borne out its early promise, for, though the flowers are unquestionably double, they do not open properly, added to which the plant loses in dignity by the shortness of the flower-stem. *A. u. minor*: As generally met with, there is little if any difference between this variety and *A. mooreanus*, though both names occur in most lists. It forms a low-growing tuft of narrow dark green leaves, but the scape is taller in proportion to the size of the plant than any of the others. The flower-head is almost globular, while the blooms themselves are deep blue. This *Agapanthus* becomes totally dormant in winter. There is a variegated leaved form, in which the narrow foliage is freely striped with white. It is an old plant in gardens, and is, by the way, nearly always met

with as *A. umbellatus variegatus*, though the small foliage and other particulars stamp it as clearly belonging to the minor section.—H. P.

FLOWERS THAT ATTRACT BUTTERFLIES.

THIS presupposes that there are butterflies to attract, as early rains and birds sometimes make butterflyless the most flowery garden. The robin is the worst offender; if a butterfly flutters by he invariably chases and snaps it up. Butterflies may be said to be attracted by all flowers, but they pay flying visits to some, having a predilection for others; and if a plot of ground is planted with their favourites, not only do they come in greater numbers, but they may be seen playing about in the same spot for an hour or two instead of for moments. This is a great advantage to anyone wishing to study their habits. As has already been stated in THE GARDEN, the Scabious is especially favoured. A few years ago Scabious were planted in a south-west corner of a garden seven miles from London Bridge. When the plants flowered several Red Admirals, a Painted Lady, the small Tortoiseshell, and a Peacock butterfly used to congregate together sipping honey from the flowers. These four butterflies may be safely encouraged in a garden, as in their caterpillar stage they only feed upon Nettles. Red Admirals are sociable and soon get accustomed to being watched; they are also fond of the large purple-flowered Teasel. A bed of Zinnias is another lure for butterflies; in this instance bright colouring, not sweetness, attracts them. The Marigold is a great favourite. Verbenas and the tall and dwarf Phloxes have their share of attention. Willow and Privet blossom, Viper's Bugloss, Petunias, and Nicotiana have a great fascination for butterflies, and also for those beautiful insects the day-flying Burnet and Hawk moths. A Hawk moth never visited the garden near London until Nicotiana was planted in it. Like the Evening Primrose, there are always some blossoms out by day, although both plants look shabby until evening. In Cornwall numbers of Humming-bird Hawk moths were noticed swarming about a Honeysuckle bush.

Long ago, in an old-fashioned garden by the River Thames, it was a child's delight to watch thick-bodied, greyish brown moths hovering by day about the Sunflowers; "Bee moths" the gardener called them. Man must necessarily be ignorant about mysterious insect life. Much that is written in books is mere conjecture, and personal observation is fallible. This is a preamble to the assertion that butterflies sleep upon and also get drugged by certain flowers like the Hollyhock and the Lilac. A branch of Lilac was picked, and on one of the flower clusters reposed the small white butterfly. It was placed in a jar standing near an open window without disturbing the butterfly, which was at liberty to fly away when it liked. Two days afterwards the butterfly was still in the same place, when it was gently lifted off and put on the window-sill. It staggered over on to its back. However, in the end it recovered. If it had been caught prisoner by sticky juice it would surely have been able to flutter its wings.

It would be interesting to know the name of the yellow flower in the poet Wordsworth's verse:

"I've watched you now a full half hour,
Self poised upon that yellow flower;
And, little Butterfly! indeed,
I know not if you sleep or feed,
How motionless!"

A far older poet than Wordsworth has so accurately noticed the plants that please

butterflies that, except for the quaint spelling and the Roses reigning in May (which shows that it was written before the introduction of the "New Style"), the words might be supposed to have been written by one of the garden lovers of to-day instead of in the year 1590:

"The wholesome Saulge, and Lavender still gray,
The Roses reigning in the pride of May.
Sharp Hyssop, good for green wound's remedies,
Fair Marygolds and bee's alluring Thyme,
Sweet Marjoram and Daisies decking prime;
Cool Violets, and Orpine growing still,
Embothed balm, and cheerful Galingale,
Fresh Custmary, and breathful Camomill,
Dull Poppy, and drink-quick'ning Setuall,
Vein-healing Vervain, and head-purging Dill,
Sound Savory, and Basil hearty-hale,
Fat Colwort, and comforting Fennelline,
Cold Lettuce, and refreshing Romaine."

W. SPURLING.

TREES AND SHRUBS.

FLOWERING OF BAMBOOS.

RECENT communications made to *La Revue Horticole* concerning the flowering of Bamboos, and especially *Arundinaria Simoni*, are corroborated by other observations which have been made during several years. But these observations may be supplemented by some details which are not commonly known. For example, for several years past I have seen my *Bambusa Simoni* at Lacroix flower, yet they do not die, though they suffer a little. I have one large sterile plant with leaves of a beautiful deep green whose central stems are more than four metres high and form a tuft of more than four metres in diameter, which does not show the least inclination to flower, yet not far from it a plant propagated by separating from the large tuft, planted by a wall facing north, is, on the contrary, covered with flowers on almost every stem. I have myself ascertained that the roots of Bamboos which have flowered in different parts of France came from the same source, although they were of various sizes and planted under very dissimilar conditions, and these all flowering together also died at the same time; but these were not *A. Simoni*, though I do not know which.

These fatal flowerings are very rare, even with plants growing wild. I remember passing through whole forests of Bamboos when descending the western slope of the Quindio, in the Andes of New Granada, and after riding hours under the shade of their immense stems I did not find a single tuft which had flowered and then died from this effort. The plant which is now in bloom at Lacroix is doing well, and I think will suffer but little from flowering. The inflorescence varies considerably. Near the base, and sometimes in the middle of the spikes (rarely at the top), large green and brown berries are produced, and take the form of an enlarged grain of Wheat. The stems, which had not time last year to form branches before the cold weather, and which remained bare as fishing-rods, have also flowered and seeded.

M. A. Houzeau writes from Mons, Belgium, that for several years past he has grown this Bamboo in the open air, and that he has seen it blossom during the spring without appearing to suffer. In 1902 he even obtained some seeds from this Bamboo, two of them germinated and produced two young plants. He has also just verified the appearance of a small spike of male flowers on *B. aurea*. While notifying this interesting fact, M. Houzeau adds the very true observation that it is astonishing thus to prove the hardihood of certain Bamboos in the open air in Belgium, where the climate is, relatively speaking, severe. He possesses a dozen species of which he has kept some for eighteen years without any shelter. Near Namur another amateur, M. Dion, has collected thirty-five different species, among them *Phyllostachys nigro-punctata* and *Bambusa Metake*, which have flourished for several years. But one must be sure of the identity of these cultivated Bamboos, and the task is not easy. It would be

more easy in France where M. de Castillon in the south, and M. Latour-Marliac, the celebrated grower of Nymphæas, have collected many species, which, thanks to the heat of the summers, rapidly attained the adult state. By help of the works of Munro and of Rivière, tolerably exact determinations can be obtained, and then we shall be able to say exactly which are the species that will grow in the open air in Belgium and in the north of France. In order to facilitate this enquiry we should be glad to receive from our readers an account of the observations they have been able to make. They would render a service to many amateurs who are desirous of having Bamboos in their parks or gardens, but do not know how to obtain them with certainty.

ED. ANDRÉ, in *Revue Horticole*.

THE TULIPAS.

(Continued from page 42.)

TULIPA PHORANIDEA (Boissier) is a Grecian plant bearing small pointed yellow flowers, flushed carmine externally, and furnished with a black basal blotch. A lemon-yellow and an orange-yellow form are often found in collected bulbs. A pretty plant for rockeries, succeeding under treatment noted for *T. clusiana*.

T. ostrowskyana (Regel) is a slender growing but very brilliant and graceful species from Turkestan. It has narrow, channelled, lax leaves; stem, 1 foot to 2 feet high; flowers intense vermilion-scarlet shading to a yellow base externally and to a small black eye internally. The inner petals are much the widest, but all are pointed and reflex on expansion. It is an exceptionally refined flower, some 5 inches in diameter, the surfaces being very lustrous, and their substance, though thin, is capable of standing much bad weather. It is too tall a plant for rockeries, and one would recommend it for the warm border, and that it be lifted to ripen. It is one of the best Tulips of its class, well worthy the little attention it requires. April.

T. persica.—A pretty but variable species inhabiting the mountain ranges of South-western Europe, known to all the world under this name, but more rightly called *T. australis* (Link), and also known as *T. breyniana*. The type plant grows 6 inches high and bears branching ruddy stems, yellow star-like flowers 2 inches across, with no basal blotch whatever. The exterior of the flowers is entirely covered with a reddish copper colouring, a production of strong sunshine, for the flowers are pure yellow in shade. The flowers are nodding; in fact, lay on the ground in a bud state, lifting themselves erect to open. They have a delicious Primrose fragrance. Its cultivation is simplicity itself. A border as hard as a roadway or a dry rockery slope with no subsequent attention whatever will prove all sufficient to grow it well. It dislikes cultivated soil, and will thrust its newly formed bulbs deeply into a harsh subsoil if the upper stratum is cultivated.

T. planifolia (Jord.).—A bold border Tulip, from Savoy, of gesneriana type, with broad, stout, channelled leaves on stems 2 feet high, and crimson-scarlet flowers of large size with rounded petals, furnished at the base with a blue-black eye, a few flushes of yellow dividing the two colours. The plant likes a warm situation, but otherwise may be treated like the rank and file of border Tulips.

T. platystigma (Jord.) is a South European plant well known in cultivation as the "rouge," to which many garden-raised, late-flowering Tulips revert. It is a robust plant of medium size, with flowers coloured a dull shade of salmon-rose, paler near the margins externally, and tinted apricot near the ill-defined yellow

base internally. It is not popular as a border plant, but when detected as a "rouge" among garden Tulips it should be cherished and seeded—not thrown away. The potentialities the plant has gathered in its course through a series of generations and in various beautiful guises, and which merely await the process of reproduction by seeds to develop either singly or in startling combination, is a wealth to be reckoned as infinitely greater than that possible to obtain by cross-fertilisation of species or the weary wait for sports. The man who laments the presence of this potential "rogue" among his Tulips, and who straightway pulls him out as a vulgar "revert," should rather welcome it as a means of increasing his riches in these beautiful garden plants.

T. præcox (Tenore).—Another European plant more generally known as *Oculus solis*. It is a strong growing, very early species, with somewhat coarse flowers, the petals of which are pointed, 4 inches long, broad below, coloured crimson with black base reaching nearly halfway up the petals. Its chief value is in its earliness, but with so many choicer Tulips in cultivation it is not worth general attention; *var. Damnuni* is the best form.

T. prestans, a new Tulipa from Bokhara, is of the highest possible excellence. It is dwarf, with very broad glaucous leaves covered with a multitude of short silky hairs. The flowers range in number from one to three, they are coloured light scarlet, of the size and shape of the familiar Duc Van Thol group of early flowering Tulips, and there is no basal blotch. The buds as soon as seen peeping through the sheathing leaves are just as richly coloured as the expanded flowers. Without doubt one of the most valuable introductions of recent years. It makes a very effective rockery plant, and seems satisfied with just ordinary treatment. It flowers simultaneously with *T. kaufmanniana*. In general character and in its hairy leaves it shows kinship with

T. suaveolens, from the Crimean Peninsula.

T. primulina is a dwarf slender species, the native habitat of which is unknown to me. It has lax, narrow leaves as long as the stems, and white or creamy tinted flowers, coloured a pale primrose-yellow at the base and flushed with ruddy bronze externally. It is a neat and pretty species, resembling in habit of growth, shape of flower, and pleasing Primrose-like fragrance the native *T. sylvestris*. It

requires a warm exposure on a rockery slope, and it only expands during very warm sunshine. April.

T. pulchella is a dwarf Cilician species, resembling *T. Lownei* in size, habit, and shape of flower. It is coloured a pretty shade of crimson, flushed externally with green, and furnished at the base with a small eye of blue colouring. March, April. Cultivation as for *T. Lownei*.

(To be continued.)

NOTES ON HARDY PLANTS

IVY-LEAVED PELARGONIUM

MME. CROUSSE.

OF course in most parts of the British Isles the Pelargonium is not hardy, but it lives out unharmed in the Isle of Wight, and therefore justifies a place under the above heading. The photograph of which we have made an illustration was kindly sent by Miss Evans, Belgrave View, Ventnor, last week. The house faces south, is sheltered from the east, and the plant was put in nearly four years ago when it

IVY-LEAVED PELARGONIUM MME. CROUSSE IN A VENTNOR GARDEN.
(It was planted four years ago, and has been in perpetual bloom since.)

was from 10 inches to 12 inches high. It has never been without a flower for two years, even in winter.

TROPEOLUM POLYPHYLLUM.

If Mr. Arnott will be good enough to add a few handfuls of mortar rubbish to the soil, *T. polyphyllum*, *edule*, and *Leichtlinii* will grow like weeds. Here bulbs the size of large Kidney Potatoes are obtained from the crevices of a mortar-built wall, where they nestle in the decaying mortar.

Baden-Baden.

MAX LEICHTLIN.

GARDENING IN SOUTH INDIA.

A BUNGALOW AND ITS GARDEN.

GARDENING in India, except for planters or retired officers who have settled down in a pretty little estate on the hills, and can lay out their gardens with an eye to permanent effect in the course of a few years, is by no means an unalloyed pleasure. True, in the spirit of the motto chosen by Mrs. Temple Wright for her charming little brochure on Indian gardening, the lover of flowers will always try to beautify the surroundings of the house in which he sojourns during his migratory existence in that land of exile, "*Sic vos non volis mellificatis apes*," and although it is a proverb among Indian officials that if you want to make sure of being transferred to a distant place, you have only to set about laying out a nice vegetable garden, by the time the produce is ready the inner man of the luckless designer of that garden will be languishing on native-grown vegetables several hundred miles away from his cherished garden, and a "wise man," who probably does not know a Turnip from a Beet, except on the table, will be enjoying the labour of the industrious "fool" of a horticulturist. Yet, fortunately, things grow so fast during the six months of the rainy season, from July to December (this includes the break between the two monsoons), that one is encouraged to do one's best in the way of gardening, and not to feel that as far as one's own enjoyment is concerned one's labour will necessarily be thrown away.

I was fortunate in being transferred to my last station in February, 1902, and in finding myself the temporary possessor of a fine old-fashioned bungalow, with a large park and the makings of a very good flower and vegetable garden. Nothing much could be done in the way of planting till the rains begun in July, but in the meantime I had plenty of time to get things in readiness and plan out all my beds and borders. My predecessors had not been very keen amateur gardeners, and, as is usual among English officials in India, most of the garden flowers were grown in pots, these being an available asset at the time of transfer of occupancy. I engaged half a dozen strong native ryots, who thought themselves well paid at the rate of 10s. a week divided among them all, and who laboured cheerfully from eight to ten hours a day, and soon picked up a very good idea of "master's" wishes. One rarely had to tell them the same thing twice. With temporary coolies to aid in ridding the garden of Spear Grass, weeds, jungle shrubs, and that sure visitant on neglect, the prickly Pear, and, incidentally, of dozens of snakes, from the giant but harmless rat-snake to the tiny but deadly viper, I soon had the surroundings of the bungalow in very good order. The park was full of beautiful specimen trees. Bunyans

of immense girth, with myriads of scarlet berries loved by birds, and long air-roots, which in many cases on descending into the soil had grown into trunks, propping up the aged tree, whose main stem, after having done duty for so long, was fittingly supported by the younger generation; Tamarinds of dense shade, and covered in due season with Nut-like fruit, so indispensable for curries; Flame of the Forest, trees of giant size, covered during the hot weather with a blaze of vivid scarlet like a sea of blood; and the Frangipani Tree with its wealth of sweetly-scented flowers, creamy white, with orange throat, filling the air with perfume for many hundred yards. The drives were widened and neatly edged, and pretty winding paths cut out about the grounds. Beds and borders were planned and excavated near the bungalow, and channels made leading from a fine tank as big as a small lake, and flowing into concrete reservoirs cunningly hidden in different spots about the flower garden.

The vegetable garden was irrigated by direct flow from these channels into the beds, but the flower garden was watered from the reservoirs by hand. All the plants in pots—*Crotons*, *Roses*, *Amaryllis*, *Tuberoses*, *Caladiums*, *Eucharis*, *Crinums*, *Dracenas*, &c.—save a few, were planted out at once, the pots being broken round them so as not to disturb the roots. Although the heat was most trying—100° to 112° by day from March to June, and the rain held off, except for occasional thunderstorms—these plants grew apace. They were, of course, watered daily. Beds were prepared with a view to growing masses of *Hibiscus*. These had distant shade of trees, save when the sun was right overhead midday, so that the soil was kept fairly moist and cool, while the plants got enough of the brilliant sunshine to make them flower well. Borders were prepared round the bungalow for climbing plants and annuals with an edging of bulbs. In front of the bungalow a large central garden was fenced in with a Bamboo hedge. This garden was entered by a long covered archway opposite the house, and was filled with flowers and climbers. A large octagonal summer-house was built of split Bamboo, and beds prepared round it for climbers, while inside brickwork stages were erected for *Ferns*, *Eucharis*, *Lilies*, &c. An abundance of large stones and pieces of rock was collected for rockwork. Pergolas and screens of immense Bamboos were erected (these only cost a few pence each, and are as large as small masts), and the kitchen garden was surrounded by a Bamboo fence to supplement the somewhat gappy hedge. In July the welcome rains began, and the beds and borders were rapidly filled with plants from the Agri-horticultural Society's Gardens, Madras. The verandah of the bungalow was filled with *Ferns* of all kinds—*Palms*, *Dracenas*, and *Caladiums*—in some of the largest leaves of which little Indian birds wove their nests.

The house was covered with climbing plants by Christmas, chiefly with the pretty and rapidly growing *Quisqualis indica* (Rangoon Creeper), of which I am so fond. This lovely climber is covered with sprays of flowers, white on opening, but by evening darkest crimson, and very sweetly scented at night. The summer-house, arch, pergolas, and screens were soon a mass of leafage and flowers, being overgrown with fine specimens of the following climbers: *Thunbergia alata*, *T. grandiflora*, *Solanum seaforthianum*, *Aristolochias* of sorts, some with giant flowers, but with what a native apothecary called a "post-mortem smell" (these, needless to say, were not near the house); *Passifloras* in some dozen kinds, the

lovely trumpet-flowered *Beaumontia grandiflora*, *Allamanda Schottii* with immense golden blooms, *Lonicera Leschenaultii*, *Jasmines* and *Bignonias galore*, and everywhere a gap appeared, owing to slow growth, the space was soon filled with *Jacquemontia violacea* with its bunches of tiny blue *Convolvulus*-like flowers, and *Ipomoea Leari*, an immense Morning Glory which spreads so by runners, like Strawberries, that out of three plants I made some thousands, and covered the whole fence round my large kitchen garden with them. The channel banks were turfed and planted with red and white *Vincas* and bulbs of rosy *Crocus*-like *Zephyranthes*. The *Croton* beds were filled with *Crotons* of every hue, interspersed with *Crinums*, *Amaryllis hybrids*, *Cannas*, and *Hippeastrums*. In the centre garden the sides of the archway and the interior of the summer-house were filled with *Eucharis* and *Caladiums*. The *Eucharis* did wonderfully well, only getting fitful gleams of sunshine through the creepers, and every pot throwing up some half dozen immense trusses of bloom.

The rockwork was covered with *Ipomoea Leari*, through which grew *Tuberoses*, *Zephyranthes*, and *Amaryllis*. The Bamboo fence round the garden was covered with scarlet *Ipomoea* and a border planted with *Ixoras* (red, white, and rose), *Allamandas*, *Oleanders* (single white and rose and double of sorts), and *Hibiscus* in some dozen varieties ran all round this garden. Between this and the summer-house were some two dozen beds filled with *Roses*, *Cannas*, *Hibiscus*, *Euphorbia*, and annuals, chiefly *Zinnias*, *Balsams*, *Phlox Drummondii*, *Marigolds*, *Dianthus*, and *Verbenas*. Where shade was obtainable under the giant Flame of the Forest trees on one side of the garden I grew several species of *Crinum* to perfection. There was an enormous *Bougainvillea* over an arch at the further end of this garden, leading to an old sundial erected by a gallant general—for the bungalow was the general's quarters years ago when British troops were quartered there—bearing his name as clearly as when it was cut nearly a century ago.

Roses, of course, in the plains do not do well. They flower freely if properly cared for, but the blooms are very thin and open too soon, and are very fleeting. But even in India one cannot call a garden worth the name without its *Roses*. I had no difficulty in getting a good stock of own root *Roses* from cuttings put down in the open in partial shade during the rains.

Amaryllis, *Tuberoses*, and *Zephyranthes* increased with me like *Crocus* and *Daffodils* do at home, and I began planting them about the grass on the lawns. The grass, of course, on the lawns round the house was watered daily and was very green, but in the park it was dried up from January to June, and during the rains had to be cut so frequently as it grew so fast that at last I adopted the amusing expedient of sending my peons (office servants) into the roads to order the shepherd boys driving their flocks from market or to pasture to turn the sheep into the park every week, but with strict orders that no goats should be admitted, for no Indian goat will look at grass while there are succulent trees or shrub shoots within his reach, and by standing on his hind legs it is wonderful how far he will strip your best specimens.

I grew many beautiful shrubs on the lawns, and where shade was available the *Gardenia*-like bush *Jasmines* did very well. Although I had to give up my garden all too soon this April to come home on leave, I had been

amply repaid already for the pains I had taken, and my pleasure was enhanced by the fact that my successor, though not an enthusiastic gardener, promised that he would gladly continue the work that I had begun, and was delighted at succeeding to such a pretty garden.

Such is a brief account of an amateur's garden work in the plains of South India. It is strange that so very few native gentlemen have any idea of the beauties of the flower garden, those that grow flowers at all generally growing them solely with a view to stringing them together for garlands for their religious rites or as marks of respect, and not caring for any arrangement to give a harmony of colour in the garden. I may add that one of the causes of any success I may have achieved in so short a time is due to the abundance of manure I was able to secure. Besides manure from my stables, I always had an abundant supply of cow, goat, and sheep manure brought in, and a large bone factory was at work a couple of miles away, so that I could procure crushed bones and bone-meal at a merely nominal price. All the beds and borders were therefore well prepared at the outset, which in India, as in England, is half the battle. R. A. JENKINS, I.C.S.

A STRAWBERRY FARM IN WISCONSIN.

THE Strawberry is grown on a large scale in America as it is in England. There is not a State or Territory where it is not cultivated and the fruits consumed in great abundance. Both city and country people enjoy Strawberries and cream when the fruit is in season. By the modern means of transporting in refrigerator cars Strawberries are sent for thousands of miles, and it is possible to find a few in the fancy markets at almost any time of year. During the flood tide of ripening the humblest may indulge in at least an occasional feast of fresh Strawberries. They are sometimes retailed at 5 cents per quart. There are single railway stations from which more than 100 carloads of 16,000 quarts each are shipped in one season. Fields of 50 acres to 100 acres belonging to one grower are not uncommon. The methods of culture do not vary greatly, and all of them include the use of horses very largely. By the use of modern tools there is little left for the hand hoe to do. Even planting is done by machinery in some cases. The most common system of cultivation is what is called the matted row. The plants are set about 2 feet apart in rows that are from 3½ feet to 5 feet apart. By frequent stirring of the soil with horse cultivators it is kept loose and free from weeds, except in the immediate line of the plants, where some hand work is often necessary. The young plants are allowed to spread over a strip, varying, according to the wish of the grower, from 1 foot to 3 feet wide. Another plan is to put the rows about 3 feet apart, and the plants 1 foot apart or a little more in the rows, and keep all the runners cut off. It produces the largest berries, but necessitates much work. By either method the best growers never allow the plants to bear more than two crops, and some but one. If they are left longer the weeds and grass become very troublesome, and the berries are not so large as on young plants. It is cheaper and better to plough them under

and spend the labour on new plantations. The native varieties are well flavoured but small in berry, and this caused the first attempts at cultivation to be made with the English varieties. But the two species were soon hybridised, and a new race was thus originated that surpasses either alone. We now have varieties of exquisite flavour that will yield from 6,000 quarts to 20,000 quarts per acre. There are about 500 named varieties of good quality, and more are being raised every year. H. E. VAN DEMAN.

THE INDOOR GARDEN.

FREESIAS.

GARDENING notes lose much of their value if they are not seasonable, and therefore my excuse for writing about these greenhouse winter-flowering bulbous plants is that now is the time to commence their culture. Much is gained by making an early start, late potted bulbs never make up for time lost at the

an amateur's greenhouse; about Christmas time when the Chrysanthemums are over and the forced Azaleas, Lilacs, &c., have not yet made their appearance the small conservatory is usually a most desolate spot; resting Ferns, half dead Geraniums, and leafless Roses more often than not are largely in evidence. And yet a display of beautiful Freesias might be had with very little trouble. The bulbs are not expensive to buy, in fact, large quantities of them are sold at the bulb auction sales in London every year. They may be grown either in pots or in boxes, in the former if required to make a display in the greenhouse or to be used in the home singly, but if cut flowers are wanted then the bulbs may be planted in boxes. It is astonishing what a quantity of flowers may thus be had.

Before being potted or boxed the bulbs should be sorted into two sizes, the larger ones and the smaller ones being kept quite separate. To mix both large and small bulbs together is the surest way to spoil a potful of Freesias, whereas when bulbs of uniform size are planted together the result is altogether satisfactory. The Freesia likes a fairly light soil, that composed of two-thirds loam, one-third leaf-soil, with plenty of silver sand added is suitable. In potting fill the pots (those 6 inches or 4½ inches in diameter are best) about two-thirds full with soil after having drained them,

A STRAWBERRY FARM IN WISCONSIN, U.S.A. MEN AND BOYS AND GIRLS ARE ENGAGED GATHERING THE FRUIT AND PUTTING DOWN THE LAYERS FOR NEXT YEAR'S CROP.

commencement. They, of course, start growth late, and lose the advantage they would otherwise derive from the late summer sun and light. The consequence is their growth is largely made in unfavourable weather, and instead of being strong and healthy is just the reverse. The best results are obtained by starting the bulbs the latter part of July; August used generally to be considered the best month for this work, but cultivators have grown wiser during the last ten years, and their methods of culture, as regards the Freesia and many other plants also, have greatly improved.

I am surprised that amateurs do not more extensively cultivate this charming South African flower, for anyone with a greenhouse or frame from which frost can be excluded may grow it to perfection. The Freesia may be had in bloom from Christmas onwards for several weeks, and nothing could be more acceptable for home decoration than its sweetly scented blossoms. Very rarely indeed does one come across a creditable lot of these plants in

then place the bulbs upon the soil (the large ones about 1 inch apart and the small ones rather closer), press them in slightly, then cover with more of the prepared soil.

Place them in a cold frame (or out of doors in a cool position and cover with ashes), covering this with mats to keep them cool and encourage root growth first. With Freesias, as with all other bulbs, one of the most important factors in their successful culture is to ensure root growth before top leaf growth commences. Without the former first assured, the latter can never be satisfactory. As top growth above the soil becomes evident by the leaves pushing their way through, the shading must be gradually removed, that is to say, do not have the pots of bulbs quite dark one day and expose them the day following to bright sunlight. If the weather is dull, the covering may be removed altogether, if bright shade them during the hottest part of the day.

The plants will make rapid progress if they are

kept cool, and this is most important. It is almost impossible to force the Freesia; the only time when heat does quicken their progress a little is when the flower spikes are seen, then if the house is kept moderately warm the blooms may be had a few days earlier. In the earlier stages of growth, however, a warm atmosphere is fatal to their well-being. When the pit or house is closed in the afternoon the temperature may be allowed to rise somewhat, but not above 65° Fahr. If the bulbs are started in July there is no need to force them in order to have flowers at Christmas, and if the plants have perfectly cool treatment, and occasional waterings with diluted liquid manure when the pots are well filled with roots, they will hardly fail to be satisfactory. As the plants are frail when the flower stems appear they must be staked; wires or neat green stakes are best. A. P. H.

THE FLOWER GARDEN.

BOLD EFFECTS IN FLOWER BORDERS.

A MIXED flower border is often spoilt by the use of too many sorts of plants at one time. In a very small place there is every excuse for this, for the owner may wish to have all his flower friends about him and has not room to make large groups; but too often in long stretches of flower border in quite large places one sees little dabs of a quantity of different plants, giving perhaps a certain brightness of colour, but fatal to any good effect. Such a border as that in the illustration shows the great advantage of a bold and quiet treatment of large masses of plants. Here we see wide breadths of Funkias and other noble plants, the whole thing full of interest, and with the quiet dignity that goes with proper treatment.

SEASONABLE WORK AMONG THE DAFFODILS.

JULY is perhaps one of the busiest months of the whole year among the Daffodils, especially where large collections are grown. Lifting and storing in

all trade establishments must be taken in hand each year. Certain enthusiasts will tell you that such and such nurserymen lift all their stocks each year, forgetful of the fact that the trade must do this whether they wish to or not, if only to select the larger roots for commercial purposes. In certain instances, and with the common sorts generally, it not infrequently happens, when these are grown in large areas, that the medium and small ones are kept apart, the former for lifting the year after planting, the latter in the second year. This means a great saving of time, and the bulbs being easily sorted into sizes when in the dry state may be the means of saving some acres of bulbs having to be lifted. Amateurs are frequently at a loss how to act, and advice, particularly as to what sorts of Narcissus may be left in the soil from year to year with impunity, and what others are best lifted and given a short season of rest, may be helpful. Lifting largely depends upon the soil. The white trumpet sorts, of which *N. cernuus* and *N. albicans* may be accepted as examples, respond well to the annual lifting, and, generally speaking, are improved thereby. We have, however, instances in mind where such as *N. tortuosus*, as also *N. cernuus* and others, have remained for years undisturbed, growing well and increasing even better than by lifting. Any reader so situated is advised to practise what experience has shown to be right in his own peculiar circumstances rather than follow a theory which must be accepted generally or on broad principles. The latter, indeed, favours the lifting whether in light or heavy soils, with a rest of not more than six weeks out of ground.

Going a little farther into the larger bicolor race, we find many of these have quite a vigorous constitution, the latter largely responsible for their safety in many gardens as well as various soils. Taking a few popular sorts, as *Mme. Plémp*, *Grandeé*, *Horsfieldi*, *Empress* (bicolor of *Haworth*), and *Mrs. W. Ware*, we find all of these like biennial or even triennial lifting, provided always they are well planted and in their last flowering gave no sign of being affected with basal disease. This applies to all sections, and it is an important point in this connexion. Other bicolors, such as *Victoria*, *J. B. M. Camm*, and *Dean Herbert*, are best lifted from all heavy soils, and only retained in the ground where the soil is light and abundantly

drained. Then there is the yellow trumpet section in which we find *Emperor*, *P. R. Barr*, and *Princeps* among many more, the first is usually safe in all soils for two or more seasons, while the others mentioned are safe in all light soils and increase readily. Both *P. R. Barr* and *Princeps*, however, cannot be left in heavy soils, while *Princeps*, where a chalk subsoil exists, will frequently die out altogether. Others in the yellow set that will repay for lifting each year are *M. J. Berkeley*, *Glory of Leyden*, *Golden Spur*, *Queen of Spain*, *Obvallaris*, *Henry Irving*, *Captain Nelson*, &c.; indeed, vigour does not appear to apply in this case at all, for *Golden Spur*, one of the strongest, is often a failure when left in the soil more than a season.

Lifting, perhaps, serves in a degree to destroy disease which would flourish and extend were the bulbs left in the soil. As I have known large areas of this kind to perish I do not advise anyone running the risk. The Barri group (and *B. conspicuus* especially) is quite at home in all ordinary soils for some years, a similar remark applying to a large array of *Incomparabilis* forms, and to the *Leedei* section generally. One small group, the *Poeticus*, seems to resent lifting. Doubtless, this is in a measure due to a nearly perpetual rooting characteristic, and the tenacious fleshy-wiry root fibres even when out of ground are remarkable.

Of this section a noted grower said to the writer many years ago, in speaking of *N. P. ornatus* chiefly, that "five minutes out of the ground is four minutes too long," and there is great truth in the observation. In this matter of lifting, the old double yellow Daffodil is very curious, and one stock will do quite well and another fail on the same land. Maiden soil is good for such as this, but this portion of the subject will receive attention later on. For the present the above notes may afford a clue as to what should be done in the sections enumerated. E. H. JENKINS.

(To be continued.)

HARDINESS OF PERSIAN CYCLAMEN.

THE Persian Cyclamen gave rise to the improved species *C. p. grandiflorum*, and which in its turn was the origin of many beautiful varieties. Up to the present time this plant has been cultivated exclusively in the greenhouse, yet this year we found it to be much hardier than we had supposed. A tuber was left in the open in a dry soil under a bank facing south and without any covering. The plant began to grow very early in the spring, and bloomed about April 15. We have, therefore, every reason to think that tubers of the Cyclamen, planted in a raised bed and sheltered simply by a light covering of dead leaves, would as a spring flower vie with the Hyacinths, Crocuses, Tulips, Narcissi, Scillas, Muscari, and other spring bulbous plants. The fact of the plants being in the open air would certainly cause the formation of very strong tubers, which it is well known are always the most free flowering.—JULES BURVENICH, in *Bulletin d'Arboriculture*.

BORDER OF FLOWERS BOLDLY ARRANGED. (From a photograph by Miss Willmott.)

THE ROSE GARDEN.

ROSE AIMEE VIBERT.

HOW beautiful this fine old Rose is just now, and it will go on flowering right into the late autumn. It is a great success when budded upon a short, medium, or tall standard Briar. I met with one the other day in a cottage garden, and it was the picture of health, the fine glossy green foliage contrasting so admirably with the bunches of snow-white blossom. Upon a very tall stem this Rose looks well,

and it quickly develops a very large head. It has not exactly the weeping habit of the Ayrshire Roses, but in time the weight of the branches causes them to bend over so that the stem is partly hidden. It is a Rose that should be afforded plenty of space, for then its fine proportions are seen to the best advantage. Naturally, such a fine climbing Rose is suitable for planting against a pillar. It does not run up very high, but it becomes dense at the base, and therefore the old and useless wood should be well thinned out, retaining their full length the one and two year old growths. I have seen this Rose flourish quite near to the sea, and I have also found it in villages completely covering thatched cottages with its abundant growths and wealth of blossom. We cannot very well make too much of these late-flowering climbers. In June and July we have a wealth of good things, but in autumn, save the good old Gloire de Dijon and a few others, we have none too many Roses that will blossom so freely as *Aimée Vibert*.

PHILOMEL.

ROSES AT RUCKMANS, OCKLEY.

THIS being now a veritable garden of Roses, I think you may like to have a short description of it. Two long beds with grass edgings full of the old Damask and the York and Lancaster, strong bushes of four years' growth, are blooming profusely, and filling the air on these hot summer evenings with their peculiar spicy fragrance.

At one end of the border is a tall bush, some 8 feet high, of the old pink Boursault, and another bush of the lovely Rose Celeste. From the grass margin of these long beds descend some wide but shallow grass steps, on a grass terrace, the steps being arched over by Penzance Briars, whose full beauty is past for this year. Along the terrace, flanked by a 4-foot brick wall, are beds of Tea Roses, Mme. Lambard, Francisca Kruger, and Anna Olivier just now especially beautiful. From this grass terrace there are more steps arched by Paul's Carmine Pillar, another transient beauty, but a vivid joy while it lasts. Then another brick

wall with yellow and white Banksian Roses growing rampant along and above it, and more Tea Roses pegged down below. Bardou Job with its velvety deep crimson, semi-double flowers is now especially beautiful.

My Hybrid Perpetuals are in another part of the garden. Two long lines of dwarf bushes are divided by a narrow grass path and backed by a high Yew hedge. Viscountess Folkestone and Frau Karl Druschki among many others are in full beauty, and I am glad to say are free from blight. I find in gardening, as in so many other things, that prevention is better than cure, and by doctoring my Roses before the fly lays its eggs, a not unpleasant morning's task, many hours of most disagreeable work may be avoided.

And now a word about the chief favourite among my many treasures. Mme. Alfred Carrière is to my mind absolutely the most satisfactory Rose. I have it growing as a

ROSE AIMEE VIBERT AT SPITAL BROOK, HODDESDON, HERTS. (The plant is 30 feet high.)

climber on the east side of the house, where it reaches to the top, and looks beautiful against the old grey lichened roof of Horsham flag stones; as a bush, upon which I counted more than sixty blooms; and as a hedge 10 feet high, where on both sides the six plants of seven years' growth are a mass of white bloom. I planted them 6 feet apart, and they form a close hedge, and are satisfactory both as regards foliage and flower from base to summit. They begin to bloom by the end of May and continue to the end of October. The Rose has a peculiar and very sweet scent, reminding one of the taste of the Muscatel Grape, and during the six years in which the hedge has been my chief garden pleasure I have never known it to be infested with green fly or other pests. I am often surprised that this Rose is not more generally popular, for its merits are so obvious that it deserves greater attention, and in this garden of many varieties it is undoubtedly everyone's favourite.

R. LYELL.
Ruckmans, Ockley.

NOTES FROM SCOTLAND.

AN improvement in the arrangement of the plants in the large circular conservatory in

the Botanic Gardens, Glasgow, was commenced by Mr. Whitton lately, the central portion having been planted with specimen Tree Ferns, each standing sufficiently wide apart to permit the observer to see most of them at a glance, while the general effect gives one the idea of a grove of this noble type of vegetation. I should imagine that nowhere else in the British Islands is it possible to find just such another group, alike for the number and quality of the plants employed and the impressive massing of the whole. A new Todea house has just been finished in the same gardens. Glasgow is unique in having attached to nearly all its public parks extensive glass erections devoted to the cultivation of flowers solely for the delectation of its citizens. Orchids are cultivated quite extensively, a houseful of Dendrobiums at Queen's Park being in the pink of condition. At Tollcross, Cyrtopodiums are made a speciality, and here, too, immense quantities of Odontoglossums are cultivated. Seedling raising goes on apace, and perhaps before long we shall have the corporation of the second city

startling the horticultural community with some out of the way novelty. The curious thing is, that all the glass structures are open to the public, whom Mr. Whitton declares appreciate Orchids to the full, as well as the tens of thousands of plants of a less aristocratic character cultivated to keep the winter gardens and greenhouses gay during the whole year. One of the most distinct pot plants I noted when there lately was

THE DOUBLE RAGGED ROBIN,

which, failing to prove satisfactory in the open, was treated as a greenhouse plant. It has proved to be quite satisfactory. In the Winter Garden at Springburn the broad raised promenade is bordered by masses of double and single zonal Pelargoniums in the most glorious colourings. The climate in the west is too wet for these out of doors. A beginning has been made in the same structure to furnish the space on the ground level with large Tree Ferns, Palms, Strelitzias, &c., planted out.

A NEW MALMAISON CARNATION.

At the recent Rose show at Glasgow, Mr. Campbell, High Blantyre, among the Carnations he exhibited on that occasion had a Malmaison of a novel colour, which I thought very attractive. I had seen the variety a year or so ago, but not in good condition. The colour is light apricot, one of those peculiar tints that must be seen to be appreciated, the petals smooth and well arranged. It is named The Queen, and the stock, I believe, will pass into the hands of a metropolitan firm for distribution.

THE FRUIT CROPS.

As the season advances the serious deficit in the fruit crops becomes more apparent. In some gardens Strawberries are a blank, in others Gooseberries, and Black Currants are so scarce that in the words of a fruit merchant whose dealings are on a large scale, "they are at ransom prices." Raspberries are perhaps the one crop that is not more or less a failure. There are many gardens in which there are no Apples, Plums, Pears, Apricots, or Peaches. It is certainly the worst fruit season since 1880. A gardening friend of fifty years' experience declares it to be the worst he remembers.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

THE NEGLECT OF THE VERBENA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It is very gratifying for one's eyes to once again gaze on clumps of Verbenas after their almost total absence from our gardens for some years. Forty years ago the new varieties of Mr. Chas. Perry, of Castle Bromwich, were the feature of nearly every well-kept garden, and at exhibitions the rows of Verbena stands were one of the chief attractions. To the very old admirers and cultivators of this charming, free-flowering, and sweetly-scented family, it affords them much pleasure to observe they are likely to come to the front again for the decoration of our gardens. The following were some of the varieties seen in competitive stands twenty years ago, and thousands would like to see them revived: *Admiration*, *Annie Improved*, *August Renz*, *Ball of Fire*, *Boy in Blue*, *Dr. Feyerlin*, *Edward Perkins*, *Esmeralda*, *Flower of Dorset*, *General Picton*, *Hawk Eye*, *Lady Langlesbury*, *Lady of Lorne*, *Lord Chelmsford*, *Lord Cranbrook*, *Lord Leigh*, *Marion Baker*, *Master R. Cannell*, *Phillip Paulig*, *Phlox*, *Princess of Wales*, *Queen of Verbenas*, *Sir Garnet Wolseley*, *Star*, *Star of Erin*, *Swanley Stripe*, and *Victor Emmanuel*.

More recently Miss Willmott, of Warley, has been giving attention to the raising of varieties of beautiful colour and form, and the one named after her has been justly admired wherever exhibited,

and eagerly sought after by all growers. At the Drill Hall a few weeks ago Miss Willmott showed another grand improvement named *Warley*, and it is said to keep entirely free from the evil effects of mildew. This charming variety will soon prove an acquisition in my opinion, and it will become a general favourite. At the same time, it will do much to bring the *Verbena* into favour again, which I hope will be as generally grown and appreciated as it was formerly. So highly appreciated was this flower forty years ago that steamboats plying on the Thames were named after various families of flowers, and the favourite boat was that christened *Verbena*.

Swanley.

HENRY CANNELL.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—There are evidences of a revival of interest in the *Verbena*. The fine seedling which originated in the garden of Miss Willmott at Warley, and which worthily bears her name, through being exhibited frequently of late has done much to quicken this interest, and evidence of it is found in the fact that other named Verbenas are putting in an appearance. It is so with some plants; they fall away for a time into comparative neglect, and then, after a time, they are taken into favour again.

Previous to the introduction of *Verbena chamaedrifolia* in 1827 some species of *Verbena* were cultivated in gardens, but when the variety *Melindres* was introduced, figured, and described, interest in the flower became quickened. *Twediana* was one of the newer introductions, and this, no doubt, was valuable as a seed parent, and the well-known species *V. venosa* was also employed for cross fertilisation. *Venosa* is a most useful subject for bedding purposes, and is probably seen at its best when employed in association with variegated *Pelargoniums* or the silvery-leaved *Centaurea ragusina*. A coloured plate of some of the new Verbenas of 1848, which appears in the January number of *The Florist* for 1849, shows small and starry flowers; but such raisers as Kendall, Banks, Geo. Smith, Lochner, and Wyness, who was gardener at Buckingham Palace, with Messrs. E. G. Henderson and Son, were all at work improving the flower, Smith, who was a florist at Islington, being a very successful raiser. To these succeeded Mr. Edmonds, who was gardener to the Dowager Lady Lacon at Great Ormesby, Yarmouth, and by 1854 some greatly improved flowers raised by Edmonds were distributed by Mr. C. Turner from Slough, and found great favour, chief among them *Blue Beard*, *blue*; *Lady Lacon*, *pink* and wonderful plum coloured. Woodroffe, of the Harrow Road, had obtained Mrs. Woodroffe, rich, deep scarlet; Robinson, of Picnic, his *Defiance*, *scarlet*; and Geo. Smith his *Boule de Feu*, bright crimson; these became highly popular bedding varieties; and, with Edmonds' additions year by year there was afforded material with which Mr. C. J. Perry, of Castle Bromwich, towards the end of the sixties began to raise the fine new varieties which were annually distributed from the Royal Nursery, Slough. Mr. Perry grew his Verbenas in pots under glass, and by this means he was able to produce bold trusses of bloom of large size and great beauty, which he exhibited in bold bunches, and thereby gave a great impetus to the cultivation of the *Verbena* as an exhibition subject. On the death of Mr. Perry, Henry Eckford, then at Coleshill, Berke, who for years previously had been an active and successful florist, took up the work, growing his Verbenas in the open, and raising seedlings which were named and distributed by Messrs. Keynes and Co., of Salisbury. Other raisers were producing varieties, among them Messrs. Keynes and Co., who became considerable trade growers of the *Verbena*, and their *Lustrous*, a brilliant scarlet bedder, if it could be secured, would make an excellent seed parent in the present day.

The introduction of the fine large-flowered forms of *Phlox Drummondii*, the *Begonia* and other subjects, brought about a decline of interest in the *Verbena*; but, as already stated, there are evidences that it is again becoming a favourite.

Named Verbenas are propagated in spring by

cuttings made from the growths of plants kept in a greenhouse during winter. Placed in pans of sand saturated with water, and the pans on a propagating bed, the cuttings root in a very short time. As it is difficult to keep old stock plants through the winter for propagating purposes, it is well to have a reserve of late-struck cuttings in pots, as more likely to come through the winter in safety; a dryish atmosphere, with care in watering, are helpful in carrying the plants through the winter.

Seeds of fine varieties may be sown on a gentle bottom heat in February and March, the seedlings duly pricked off and grown on into size, and then planted out at the end of May to flower during summer. Seedlings are generally more groes in growth than propagated plants, and the soil in which they are planted, while being of good heart, should not be too highly manured. Seedlings vary in quality of flower, and also in habit of growth, and therefore, if certain effects and combinations be required, propagated plants of known varieties should be employed in preference.

Until comparatively recently Verbenas were grown in pots and exhibited as specimen plants, and particularly so in the West of England. The plants were grown in good sized pots, and their branches displayed over a kind of sloping shield, placed in a sloping position; the flowers thus faced to the front, and it was remarkable what superb masses of bloom were thus obtained. Bunches of trusses of Verbenas are now superseded on the exhibition table by those of *Phlox Drummondii*, the improved varieties of which, when well grown, make striking exhibition subjects.

R. DEAN.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I am not sure whether what is commonly regarded as the decadence of the *Verbena* is not partially due to indifferent treatment and partly to seedmen's enterprise. If we can, as we undoubtedly do, perpetuate Verbenas so well through seed, it is evident that the plant does not lack stamina. Certainly we can now obtain from a packet of seed varieties of singular beauty, such as were in existence in the palmy days of the *Verbena*, and which we should have jumped at as first-class additions. But I want to have it made clear that the *Verbena* as propagated by cuttings from named varieties really has deteriorated. A few years since when in one of Lord Farrer's greenhouses at Abinger Hall, Guildford, Mr. Payne, the gardener, an old Kew man, drew my attention to fine pots of plants on a shelf of varieties that were widely grown as bedders so long since as 1850. These included *Purple King*, *Scarlet Defiance*, *Admiral Dundas*, and some others I have forgotten the names of. Now it was obvious that what Mr. Payne could do so well, others could do also, and he had preserved his stock of these old varieties solely by treating them as hardy greenhouse plants in the winter, only subjecting them to warmth in the spring, when propagation had to be resorted to.

In the old days fifty years since there was no trouble in keeping Verbenas in robust health. Two favourite methods of keeping stocks existed. The best was that of shifting some young plants in the spring into 6-inch pots, keeping them moderately pinched during summer and fully exposed outdoors on an ash bed to the sunlight. These plants always wintered well and gave a fine stock of cuttings in spring. The other method was to root young shoots that were not carrying flowers in the autumn, or really about the middle of September, putting twelve to fourteen in a 6-inch pot, letting them get well rooted, wintering them on a top shelf in a rather cool greenhouse, and getting plenty of cuttings from them in spring. If aphids gave trouble, an occasional dip into a nicotine solution, the pots being carefully inverted, kept them clean. If we had in those days no patent insecticides, certainly we had as many insects, and could always manage to keep them in check. We did get, as bedding out was then regarded, some fine masses of colour from Verbenas, the difference between those propagated plants and those now obtained so freely from seed being that then we did know what the flowers would be and

growth was not rank. Now there is no certainty as to colour of flowers, and growth is apt to be rather wild. All the same, I freely admit that I have seen many mixed beds of seedling Verbenas that were very beautiful for a season, though apt to be overgrown towards the autumn.

It is rather odd that the recrudescence of the Verbena as a propagated plant should be due to a lady amateur gardener. All honour to Miss Willmott for what she had done. Starting with a superb and now wonderfully popular variety in her namesake, she has set for herself a difficult task to find something to excel it. It is indeed creditable that her beautiful variety should so soon have become a widely grown market plant. The scarlet Warley reminded me much of the old scarlet Defiance, a popular bedder in its day. What a fine effect would be created were a bed carpeted with Warley, close pegged down, and strong plants of Ellen Willmott dotted in 2 feet apart? No doubt one reason for the removal of Verbenas from gardens as bedders was their tendency to produce rather flat formal masses of one colour. In those days we had not learned to use such plants as carpets, with tall graceful plants standing above them. Let us hope, thanks to Miss Willmott's efforts, the Verbena has yet a bright garden future.

A. DEAN.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I believe that one thing that caused the Verbena to be neglected was the extreme forcing to which the plants were in many places subjected in their propagation. A cold frame is the best place in which to strike Verbena cuttings. Place about 8 inches or 10 inches of half-rotted leaves beaten firmly into the bottom, and over the leaves put about 3 inches of light soil composed of one part loam, one part well-rotted leaf-mould, and one part sand. This should be well mixed, passed through a $\frac{1}{2}$ -inch sieve, and firmly beaten down with the back of the spade. Select cuttings from fresh shoots that have not bloomed and become wiry and long pointed. Cut through at the third joint from the top, remove the two bottom leaves, and dibble them into the frame about an inch apart. Water with as little delay as possible, so that they are not allowed to droop and get checked by being dried up. Shut down the frame, and

give shade during strong sunshine in the middle of the day. After a few days the lights may be tilted in the evening, and in the morning, if the day is likely to be hot, they may be gently dewed overhead with a fine rose or syringe. Under this treatment they will root without making much top growth, and make better plants than those struck later in the season and in warmer quarters.

Ashwellthorpe Hall, Norwich.

T. B. FIELD.

DAFFODILS FROM SEED.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I read with much interest a letter on "Daffodils from Seed" in THE GARDEN of the 18th ult. The list of seed bearers will be very useful to many who are not acquainted with the habits of the different Narcissi in this matter. I was surprised that "N. B." has not succeeded in obtaining seed from Empress. I have always obtained a fair quantity of seed from it. Sir Watkin and Crown Prince I have also obtained seed from. I have also had a lot of seed from grandis this season, although I have never before had any from it. I failed to get any from ornatus this year. The severe frost in the middle of April must have done considerable damage when the process of fertilisation was going on.

W. A. WATTS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I have read "N. B.'s" note on this subject (page 45) with the greatest interest, and, as one who has quite lately begun to hybridise these flowers, I should like to say how very helpful this list will be to me in the future, and I feel sure to many other readers as well. In fact, I have been endeavouring to obtain such a list for some time, but without success, for the very good reason that most of those who do know will not impart their information to others. This last spring was remarkable for the indifferent way in which many varieties set seed, and I question whether we could possibly have had a worse season for pollen. Beatrice Heseltine seeded splendidly with me this year, and I also obtained a good deal of seed from pallidus præcox crossed with obvallaris. A fallacy which I find exists amongst some amateurs is that now the standard of excellence has become so high

it is almost useless to cross-fertilise the commoner varieties. That this is quite a wrong idea is frequently proved. Last year, for instance, saw the advent of that splendid yellow trumpet King's Norton, which Mr. Pope assures me was simply a chance seedling raised from Emperor and not crossed. And this fact serves to demonstrate the wisdom of Mr. Burbidge's advice which Mr. Bourne reiterates, "raise seedlings—hybrids if you can—but raise seedlings."

All Daffodil lovers will welcome Mr. Bourne's book. It is clear and concise, and written in such a way that the veriest tyro cannot fail to understand it. But neither Mr. Bourne nor your correspondent "N. B." make any mention of the fact that provided a little extra cultural attention is given to seedlings their time of flowering can be considerably hastened. A friend of mine sowed seed in the autumn of 1898, which he had obtained by crossing Weardale Perfection with Mme. de Graaff. The plants were reared in a cool greenhouse, and as soon as they were 3 inches high were potted separately, with the result that they increased in size more quickly than they would otherwise have done. Most of them bloomed this spring in the open beds, in which they had been planted for two years, and both the flowers and bulbs proved to be equal to an average Mme. de Graaff. To deal with a large number of seedlings in this way would be too much of an undertaking, but seed saved from the choicer varieties should be well worth this extra trouble. In order to encourage the raising of seedlings the Midland Daffodil Society offer some handsome prizes in their schedule for next year for a small group of six seedlings, in addition to the usual class for twelve seedlings.

Worcestershire.

ARTHUR R. GOODWIN.

HALTON GARDENS, TRING.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—It was my good fortune about ten days ago to have the privilege of looking round Mr. Alfred de Rothschild's gardens at Halton, near Tring, and perhaps I may say I saw there what I considered to be decorative gardening at its best. The masses of evergreens are a picture in themselves, and receive every attention in the way of pruning at the proper time of year. In the summer season baskets of pink Ivy-leaved Geraniums are studded about these evergreens at irregular distances from 4 feet to 20 feet from the ground. These baskets, which measure about 4 feet across, are fixed upon poles and are a mass of flower. No one can form an idea of the effect of this arrangement, and in my own opinion it puts all the old styles of bedding out quite in the shade, and I can only say it reflects the greatest credit upon Mr. Sander, the head gardener at Halton, for conceiving such a splendid idea for decorative gardening.

Bletchley.

G. B.

ENGLISH IRISES AT KEW.

ONE of the prettiest pictures in the Royal Gardens, Kew, a few weeks ago was the grouping of English Iris in a way we have never seen before. It is a happy way of using a beautiful flower which is too often confined to the mixed border. Our illustration will convey better than a description the effect of this free and unusual grouping. The English Iris, by reason of its broader segments, is better adapted for this method of planting than the Spanish group, which is apt to look weak unless planted with great discretion. There is this advantage, too, that the bulbs of both groups are very cheap.

A BREADTH OF ENGLISH IRISES IN THE ROYAL GARDENS, KEW.

INSECT PESTS.

THE GOOSEBERRY MITE.

CLOSELY allied to the red spider of Vines is this tantalising little pest, which, in scientific circles, answers to the name of *Bryobia pretiosa*, and invariably causes trouble amongst Gooseberry bushes during the summer months. In the market plantations in Kent it is a terrible pest, and gives more trouble to the growers than any other on account of the great difficulty one has to eradicate it. But for the sickly yellow appearance which the leaves of infested bushes assume, it would be difficult to locate the pest, which is a mite in the strict sense of the word. As it is there is no trouble in distinguishing the enemy, because the leaves, instead of being of a bright green hue, turn to a reddish brown, and from that to yellow, after which they fall. By the aid of a microscope the pests may be observed clustering on the undersides of the leaves while they are engaged in extracting the juices from them.

There are certain conditions under which the Gooseberry mite does the most damage, and one is in the case of old and partially worn-out bushes. A bush that has lost the vigour of youth falls an easy prey to the mite, and when the latter is on the warpath it is such a specimen that first succumbs. Drought is also conducive to the spread of mite, particularly at the roots, and for this reason bushes growing in hot, shallow soil invariably suffer. Poverty is another cause, and those good people who think they can grow Gooseberries successfully year after year without giving the bushes any manure are generally among the first to complain of the mite trouble. Prevention is better than cure, and to evade loss at the hands of the pest in question there is nothing like maintaining a free vigorous habit by growing young bushes and treating them liberally.

If, in spite of these preventive measures, the foliage looks unhealthy enough to give rise to suspicion, a few of the leaves should be carefully examined through a glass, and if mites be discerned spraying operations should be commenced at once. Any advertised insecticide that will kill red spider may be used, and a good home remedy is formed by dissolving 2oz. of soft soap and a handful of flowers of sulphur in a gallon of boiling water. A wineglassful of paraffin should also be added and thoroughly churned in. The mixture should be warm when used, and be applied to the underside of the foliage after the sun has gone down in the evening. Prompt application will stop the spread of the pest, but if it is allowed to get headway much damage is done, and old bushes not infrequently die under the injurious influence of the mite. G. H. H.

NOTABLE GARDENS.

PARK PLACE, HENLEY-ON-THAMES, is well known for the great beauty of its extensively wooded grounds. They have their eminences and undulations, and from the former magnificent views can be had of the lands lying in the valleys. There are noble trees, extensive gardens, and much glass. On every hand there are interesting features and natural pictures of fascinating beauty. To get a glimpse of the splendour of the woodlands, the domain needs to be approached from the opposite side of the river which fringes the slope of woods. In carrying the eye from the lowest point upwards it seems as if every form of tree, variety of leaf and shade of green, can be seen. One perceives a great variety skilfully blended, giving the appearance of the work of a planter who knew what he was about. There is no thought of confusion in the wide slopes of wood falling away to the gleaming river. The rising woods waver all over in the soft mellow sunlight, the leaves rustle in the gentle breeze; ear and

eye alike draw in the inspirations of life and beauty.

The summit nearly reached, we come to the long subterranean passage through the native chalk, and beyond the plateau, with its massive trees and cool shrubby walks, with much in the way of picturesque tree and shrub on every hand; a fruit garden with its flower border on either side, had its edging of Cupid Sweet Peas, which Mr. Stanton stated are found to bloom much better planted in a line than when in masses; then to some glass erections with an inspection of their contents, of fruiting trees and flowering plants; at the back of one a huge bank of the orange-flowered *Streptosolen Jamesoni* as one rarely sees, covering a very large space of wall; but this is but one of several floral features of like character. The charming residence of the gardener was also visited; this is being prepared for Mr. Powell, who, having acted as foreman for a long time to Mr. Stanton, now succeeds him as gardener, the latter devoting himself to the estate. Mr. Stanton has had charge of the gardens for over thirty years, and during that period has greatly improved and extended them and the grounds. The bothies are quite up to modern requirements, and the large sitting and reading room set apart for the young men is admirably fitted up and lined with pictures, including several photographic groups of the past and present employes on the estate, who are brought together by the generous liberality of Mrs. Noble once a year, and the visit recorded in this way. Close to the gardens are some delightful cottages for the workpeople, the walls planted with various cordon fruit trees by Mr. Stanton. In visiting Park Place one is able to gather some idea of the great moral and social benefit arising from the interest in and concern shown by Mrs. Noble in the interests of the employes on the estate.

I paid but a very hurried visit to this fine domain. I left it as the oncoming of evening brought changes from light to shadow on the landscape and on the woods, upon which the eye dwelt with a sense of rest and refreshment. R. DEAN.

MISCELLANEOUS.

SOME POPULAR ERRORS ABOUT MUSHROOMS.

MUCH of the uncertainty which to many persons seems to attend the collecting of the edible fungi is fostered by the many popular errors concerning the true nature of these plants and the means by which they may be identified. These mistaken notions, which often amount to superstition, are largely due to the fact that a large part of the development of these plants is hidden from view. Consequently their ways are shrouded in mystery to the average observer. Then, too, their sudden appearance, coupled with the fact that they often grow in dark, damp places where most other plants do not thrive, lends to them an unnatural, strange, or uncanny aspect, which may often prove a fertile source of suggestion to the superstitious mind.

Thus it seems to be no uncommon belief that in some mysterious way toads have something to do with them, hence the term Toadstool, which suggests to the imaginative mind the picture of a toad squatting on top of one of these plants. It is to be very much doubted if any person ever saw a toad in such an unusual and uncomfortable position. Moreover, many of them are incapable of supporting the weight of even the smallest toad, while others often grow where no toad has ever been. In fact, there is no more foundation for such a belief than there would be for an idea that toads cause the growth of other plants near which they may happen to be found.

One very common error in the use of these terms is that a Mushroom and a Toadstool are two distinct things, hence the oft-repeated query, "How do you tell a Mushroom from a Toadstool?" To the surprise of the enquirer the answer of the botanist is that there is no difference. This

leaves the matter in greater doubt than before. The person who is able to recognise one fungus as edible usually applies to it the term Mushroom, and calls all others Toadstools; while another person may be familiar with the edible qualities of a number of kinds and use the same method of naming them. Thus it will be seen that what would be a Toadstool to one person would be a Mushroom in the vocabulary of another, and with equal propriety in each case, therefore the synonymy of the two terms is established through popular usage. Moreover, no scientific distinction is made between these two terms. It is evident, therefore, that there are edible Toadstools as well as poisonous Mushrooms.

This question is also suggestive of the prevalent idea that there is some short and reliable test or rule that can be applied, and which, like a lucky-stone, will guide its possessor in the selection of the good and the avoidance of the harmful kinds of fungi. Thus the collector of fungi for scientific purposes is often warned by the persons whom he meets against eating any of the specimens in his basket, while some sure and time-honoured formula is condescendingly proffered. The expressions of amazement and incredulity on the faces of these persons when told that all of your specimens except, perhaps, two or three are edible, are often amusing to see. Many otherwise well-informed persons claim to be able to "tell a Mushroom" by some such test as the following: The cap must peel readily; they are pink underside; they should not blacken a silver spoon in cooking; must have no disagreeable taste nor odour; should turn dark when salt is sprinkled on underside; avoid those having bright colours, &c. These are only a very few of the rules or so-called tests that are supposed by many persons to enable them to discriminate between good and bad fungi. It is not strange that the terrible fatalities that now and then occur from eating poisonous Mushrooms should be found among the ranks of those who have faith in the above means of discrimination. It is only to be wondered at that they do not occur more often, for while some of these rules might serve to exclude "the deadly Amanita" and its noxious relatives, others are no more to be relied upon than is a horse-shoe over the door in an epidemic of small-pox. Furthermore, most of these rules exclude many of our choicest and most abundant food species of Mushrooms.

If, then, there is no easy set of rules, no reliable test that will exhibit the danger signal, how is the novice to know when gathering the fungus offerings of woods and fields, that he is not placing himself in a fair way to become a subject for the coroner and undertaker? The real question to be answered is, How can we learn to know the edible from the poisonous species of Mushrooms and Toadstools?

The popular demand for some short and easy way to make this discrimination has often led to the adoption of some artificial means in lieu of the only safe and natural method, the use of the botanical characters of each fungus. It is desirable, therefore, in gaining a correct conception of the Mushrooms and Toadstools, to realise that each kind has certain definite characters which, when familiarised, admit of ready recognition. It is also a well-established fact that some species of fungi are wholesome while others are poisonous. Thus it logically follows that if a person is familiar with the specific characters of any species of edible fungus, he may safely collect that species for food. This is the method pursued by many persons who know only one or two kinds, and so long as they have recourse only to those species with which they are familiar they incur no more risks than in the use of other articles of food. Therefore, a preliminary answer to the foregoing question would be, before using any Mushroom for food, learn to recognise it by its botanical characters, or at least become so familiar with its appearance that it can be recognised under all circumstances.

If, in addition to such information, the specific characters of the few poisonous kinds apt to be met with are also familiar to the Mushroom hunter, an additional safeguard is assured, and one which will enable him to discard those species which are the most common cause of disaster. One of the

GRAPE APPELEY TOWERS.

most encouraging features of this subject, contrary to the usual supposition, is the fact that most of the species of Mushrooms and Toadstools are either edible or are at least possessed of no dangerous qualities. And, fortunately, the comparatively few species which do possess a dangerous and poisonous principle also have a structural character, which, when familiarised, admits of ready identification.—*Bulletin of Agricultural College, Michigan.*

THE FRUIT GARDEN.

GRAPE APPELEY TOWERS.

It is remarkable that this handsome black Grape, and the white variety named Lady Hutt, being as they are in most respects strikingly dissimilar, should have been raised together from identical parents.

This shows how uncertain are the results of cross breeding, and what interesting surprises are sometimes in store, even for the practical hybridist. Appley Towers belongs to the various thick skinned late keeping Grapes that, especially in the black division, include some handsome varieties. Some, such as the Alicante and Lady Downe's Seedling, have for many years been popular under glass. Appley Towers has some valuable qualities, and is well known, yet it does not appear to have

own roots. It is rather late compared with many varieties in ripening its fruit and wood, retaining its foliage in fresh condition for an unusually long time, and for these reasons it should be allowed a fairly long season of growth to ripen its fruit early in autumn, so that not only its fruit but its wood also have an opportunity of becoming perfectly matured. With the same object in view its lateral growths should be afforded liberal space in which to develop their large foliage.

The raisers and introducers of new hothouse Grapes appear to have given particular attention to the section to which Appley Towers is closely related, for most of the new varieties belong to it. Appearance has apparently been the attraction, but handsome and valuable as most of these varieties unquestionably are, both for their good keeping properties and simple cultural requirements, they are not remarkable for flavour, which is, after all, the principle virtue of a Grape. With the Frontignan, Muscat, or Sweetwater sections, to which Muscat of Alexandria, Mrs. Pince, Madresfield Court, Black Hamburgh, and similar choice varieties belong, hybridisers would probably reap rich reward. Closer attention should be paid to these highly flavoured classes.

THOS. COOMBER.

The Hendre Gardens, Monmouth.

become generally grown, although it has been said that market growers in the Channel Isles appreciate it. Its proper place is in a late house, where it should receive treatment that suits the Alicante, and it is as easily managed. It grows very freely, forms strong wood, and robust thick foliage, which red spider cares little about. It shows and sets its fruit freely, and develops firm, compact shouldered bunches, that, if the berries are properly thinned, travel well. The berries are large, oval, perfect in colour, and carry a thick bloom. When well grown the bunches are very attractive. In flavour it may be compared with that of other Grapes of its class, being pleasantly brisk and refreshing, and keeps well. It has a firm flesh and somewhat thick textured skin. We have it growing in an inside border, inarched upon a Madresfield Court stock, and it thrives and fruits well, though its robust healthy condition indicates that it would succeed equally well upon its

GARDENING OF THE WEEK.

ORCHIDS.

MILTONIA ROEZLII

SHOULD, as new growth begins, be repotted or surfaced with fresh sphagnum moss. These plants must always be kept in fresh sweet compost; if, therefore, the latter has got into a bad condition, they should be turned out of their pots and the roots relieved of all sour material, rinsed in tepid water, and again repotted in good fibrous peat and fresh sphagnum moss in equal proportions. Other plants in good condition that require more rooting space should be transferred, without disturbing the roots, during bright weather, and especially after repotting they should be more heavily shaded, as Miltonias are very impatient of bright sunlight, too much of the latter quickly causing the leaves to turn yellow. This gives the plants an unhealthy appearance. Few Orchids are more subject to thrip or more quickly disfigured by them than *Miltonia Roezlii*; therefore, as the young growths advance fumigate the house with XL All about once a fortnight, and frequently sponge or dip the plants in soft soapy water or some insecticide.

IPSEA SPECIOSA.

This terrestrial, deciduous, tuberous-rooted Orchid should, after a long period of rest in a cooler temperature, be placed in the stove or warmer part of the Cattleya house. Immediately growth begins repotting should be done. Shake out the tubers and free them from all old material. Cut off the majority of old roots and flower-stems, prepare clean pots filled about one-third their depth with crocks or Fern roots, and over these place a layer of moss. Use a compost of peat and sphagnum moss, chopped to about an inch in length, leaf-mould and fibrous loam in equal proportions, with a small quantity of coarse silver sand, and mix the whole well together. Place some of the material in the pot upon which to lay the tubers, leaving sufficient room for the tubers to be slightly buried. When repotting is finished plant them so as to leave sufficient room for the tuber to develop properly. In working the compost, which should be pressed moderately firm, among them great care is needed to prevent the young growths being broken or in any way injured. Finish off level or a little below the rim of the pot. Apply water sparingly until the growths have further advanced, and the new roots taken to the fresh material, after which the plants should be syringed overhead once or twice a day, and never be allowed to suffer for want of water at the root.

THUNIA.

Thunia alba, *T. marshalliana*, and *T. Bensoniæ*, when they have finished their growth and passed out of bloom, should be allowed to become moderately dry at the root, and then removed to a very light position in a more airy, cooler temperature and drier atmosphere. Syringe occasionally to prevent the intrusion of insect pests, and give sufficient water to keep them plump until they lose their leaves, when but little will be required.

F. W. THURGOOD.

Rosslyn Gardens, Stamford Hill, London, N.

THE INDOOR GARDEN.

PELAGONIUMS.

PLANTS of the show and fancy sections should now be pruned. It is good practice to make two batches of them, therefore select plants that are thoroughly ripened, taking the show varieties first. Prune them back to two or three buds at the base of this year's growth for the weaker plants, or what are termed fancy varieties. These generally produce shoots more freely than the show forms, therefore cut away all the weak shoots in the middle of plants, and the stronger ones should be cut back to two buds only. After pruning place the plants in a cold frame standing in an open, sunny position. Syringe them morning and evening in bright weather.

CHRYSANTHEMUMS

will now require frequent attention to tying in the shoots, which must not be done too tightly. Attend to keeping the plants clean, and where green fly is troublesome syringe the plants with diluted Quassia Extract, in which a small quantity of soft soap has been dissolved, for unless the points of the shoots are kept clean the results will be disappointing. Earwigs, too, are a serious pest at this time of year. They must be trapped with short lengths of Bean stalks placed among the shoots, and which must be looked over two or three times a day. Remove them quickly and blow through them while holding them over a pail half full of hot water. The strong-growing varieties will dry more quickly than the weaker ones, hence the plants must not be watered in a routine manner, but the work should be governed by thoughtful attention. In like manner some plants will require a little stimulant long before others have filled their pots with roots, and until this is the case stimulants should not be given. Mildew in some places is becoming troublesome. On its first appearance lay the plant down on a mat and give it a careful spraying with XL All mildew wash diluted according to directions. On all dry days syringe the plants freely with clear soft water that has been exposed to the atmosphere for several hours.

BEGONIA SOCOTRANA.

This valuable species enjoys a long rest. The time has, however, arrived to stimulate it into growth by placing it in a warm, moist house or pit and giving the soil a watering. As soon as the young growth is half an inch to an inch long shake the old plants quite out and repot in light, rich, open soil.

MALMAISON LAYERS.

Prepare soil for potting up the layers into 3-inch pots as soon as they are rooted sufficiently, which should be the case in fourteen days from the time of layering. Take of good turf loam, with all the finer particles shaken out, two parts, fibrous peat pulled to pieces by hand one part, decayed Oak or Beech leaves one part, an 8½-inch potful of broken charcoal, and two of coarse silver sand to a barrowload of the mixture; this will make a good compost for the rooted layers, and if allowed to remain heaped in a shed for a week will then be in good condition. On lifting the layers for potting sever the old stem 2 inches below the tongue of the layer. Before potting it may be reduced to 1 inch. This will help to keep the young plant firmly in its position in the pot until root action commences. Press the soil around the young roots moderately firm and put a small stake to each plant as it is potted. Afterwards place them in a cold frame and not more than 6 inches from the glass. Give sufficient water through a fine rose to moisten the whole of the soil in the pot. Keep the frame rather close for two or three days and shade the plants with a piece of light tiffany.

Wendover.

J. JAKUES.

CHRYSANTHEMUMS.

DWARF-TRAINED SPECIMEN PLANTS.

CONTINUE to support and train out the growths as naturally as possible, and allow plenty of room between each plant, so that ample light and sun can reach them; stout, short-jointed growths will then result. The plants will now require plenty of feeding. Manure water made as advised for those which are being grown for producing large flowers will suit them well, also Peruvian guano, well diluted, and during showery weather apply slight applications of Clay's or some other approved patent manure. During bright days give frequent dampings overhead with tepid water, also keep the ground well damped round and about them. Allow no insect pests or fungoid growths to get established, but take the necessary means to arrest them.

STANDARDS.

These when well cultivated make excellent decorative plants for the conservatory. The unsightly method of training them on wire frames

and tying down the blooms to them, which was practised rather extensively some years since, did much to bring them into disrepute. When, however, the desired height is gained, and the heads are allowed to assume a somewhat natural habit, much in the same way as a standard Rose, they are very attractive. Especially beautiful are many of the singles and bright coloured Pompons. Good strong stakes will be necessary to protect them against wind, and the growths can be loosely but securely fastened to the same. These will also require plenty of feeding.

POMPONS, POMPON ANEMONE, AND SINGLE VARIETIES.

treated as bush plants, should by now be well rooted in their flowering pots and the necessary number of shoots formed. These are best when a suitable light is at command, grown in squares, and allowing ample room between each. One good stout stick only should be used as a support, and each shoot looped neatly to it. Grown in this way these make splendid decorative plants.

For cutting, the single varieties can hardly be excelled. Since the introduction of so many really fine varieties, both as to colour and form, these find many admirers, and, by late stopping, there is no difficulty in having them quite fresh even in midwinter, when flowers are generally none too plentiful. Small plants in 5-inch and 6-inch pots are also very serviceable, and any surplus plants may with advantage be potted on, and if liberally treated by paying strict attention to watering and feeding, after giving one stopping and selecting a good open position, they will well repay for the trouble. Allow from three to six shoots to the plant, according to the strength.

Early-flowering Pompon varieties which have been planted out with a view to lifting and potting should, after the buds are well set, be so treated. In the first place, make quite certain that the beds in which they are growing are thoroughly soaked. The soil and pots should be ready, and these, after allowing a good ball, should be placed in the smallest size possible. Thoroughly soak them in, place in a cold frame, shade and keep close for a few days, gradually giving air more freely, till they are safe to place in the open. Syringe several times during the day so that they are not allowed to flag. These will require plenty of feeding after once the plants become established, and should be slightly disbudded. Such varieties as Piercy's Seedling, White St. Crouts, Flora, and Mrs. Cullingford are very suitable for growing and treating in this way, and are well adapted for window boxes and many other positions where the more tender flowering plants fail to do well.

E. BECKETT.

Aldenhall House Gardens, Elstree.

FRUIT GARDEN.

HARDY FRUITS.

PEACH, Nectarine, and Apricot trees which have not been nailed or tied in must have immediate attention; keep the growths of the current year within bounds so that a fine autumn may ripen the wood. Before nailing is commenced stop all laterals and sub-laterals, and pinch the points out of growths which are likely to become too strong, and carefully guard against overcrowding by laying in a single shoot that will have to be cut away in the winter. If mulching has been neglected the use of strong stimulating manure, which does a great deal of good in hot seasons, may be dispensed with, particularly in cold districts, and a covering of fresh stable litter or old lime rubble substituted with advantage. Net Morello Cherries to protect the fruit from birds, but first of all see that the tips of shoots are free from black aphid, and, if necessary, repeat the dipping in Tobacco water. Prune and net Currants, but do not cut the young growths too short, as a moderate quantity of foliage protects the fruit from sun and rain, and favours its keeping well into the winter.

VINES.

Muscats now beginning to take their last swelling should have the inside borders well mulched with half rotten stable manure, the ammonia from

which will be found inimical to red spider, while its stimulating properties will benefit the foliage and draw many of the active surface roots to the influence of warmth and air, so essential to the perfect finish of this Grape. Keep a sharp look-out for scalding in the Lady Downe's house, should the weather continue as unsettled as it has been of late, and maintain a night temperature of 70° with a little top air and by ventilating freely through the day. To ensure the ripening of this and all the best winter Grapes by the middle of October the above temperature should be continued as the minimum, with a corresponding rise through the day, and if these cannot be secured from solar heat alone, steady firing, while it increases the size of the berries, will be found more economical now than sharp forcing with double the amount of fuel in the autumn. Encourage newly-planted Vines to make rapid growth by closing early. Keep the laterals pinched to one or two buds, stop the leaders when they have filled two-thirds of the trellis, and then allow them unrestricted growth to the end of the season.

STRAWBERRIES

promised a heavy crop of blossom, but the frost in the middle of April destroyed all the flowers then open and a great many of the most forward and best buds. The excessive wet weather that followed caused the plants to make too much foliage, with the inevitable result, undeveloped fruit of poor flavour. It is curious how much better some varieties have stood the adverse season compared with others growing side by side. Royal Sovereign, grown from earliest runners on specially prepared plants, planted on rich land as early as possible, gives the finest fruit fully ten days earlier than older plants; we seldom save them for a second crop. The new Laxton has also done well treated so. For mid-season crops we grow Burleigh President, Leader, and Trafalgar. These varieties, with the unbeaten Oxonian on the north border, are our sheet anchors in Strawberries, but, of course, grown on a different system and occupying the ground for two seasons and sometimes three. Burleigh President is an improved selection of the late Mr. Gilbert's. We consider it a favourite for late forcing on account of its fine flavour and firm texture.

Madresfield Court.

WILLIAM CRUMP.

THE KITCHEN GARDEN.

TURNIPS FOR WINTER.

A GOOD breadth of these should be sown about this date to stand the winter. They will produce good roots for use in the kitchen, and will also furnish a supply of wholesome greens in early spring. This crop may follow early Cauliflower, Peas, or Potatoes, and if the ground was fairly well dressed with manure for those crops none will be required for the Turnips. Fork over and clean the plot, then tread and secure a fine tilth to receive the seed. Drills should be drawn 15 inches apart and 2 inches deep, and the seed sown thinly. The two varieties I usually depend upon for this sowing are Red Globe and Chirk Castle. The last named is not attractive in appearance, but the flesh is firm and white, and it is exceptionally hardy. Not the least of its good qualities is the freedom with which it yields tender sprouts in spring.

CELERY.

The earthing up of the earliest rows of plants will by now have been commenced. It should not be followed up too rapidly; rather allow the plants to attain to a good size and then blanch them. This remark also applies to the main crop and late rows. These will now have made a good start, and they should be watered frequently and copiously. On fine days prepare the plants for earthing by weeding and cutting off side-shoots and leaves that are yellow. Quick growth is essential to Celery, and means should be taken to promote it by watering with liquid manure and soot-water.

CAULIFLOWERS.

To maintain an unbroken supply of these the plants that have been planted to firm successions must be kept watered and fed with an approved

manure or by mulching, for unless free, unchecked growth be maintained the heads will be small and strong in flavour.

RED CABBAGE.

Generally speaking there is not a large demand for this in private establishments, but where any are required for pickling purposes seed should be sown, and the plants put out in like manner to that advised for the ordinary Cabbage.

RUNNER BEANS.

This is an important crop in most gardens, and they well repay any extra attention bestowed upon them at this time and onwards. The aim should be to prolong the bearing season as long as possible, for when once these Beans are sent to the kitchen there is a big demand for them, and the dwarf sorts have to take a back seat. They are gross feeders, and will attain to a great height if well grown. A mulch of fresh manure will be of great benefit.

Stoneleigh Abbey Gardens. H. T. MARTIN.

SOCIETIES.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.

THIS society, which is affiliated to the Royal Horticultural Society, held its fifteenth annual show in the Sophia Gardens, Cardiff, on the 22nd and 23rd ult., and was honoured on the first day by a deputation from the Royal Horticultural Society, consisting of the Rev. W. Wilks, Mr. F. Lloyd, Mr. A. L. Wigan, Mr. J. Veitch, and Mr. S. T. Wright. The society is fortunate, through the kindness of the Marquis of Bute, in having such a beautiful and convenient place in which to hold its shows, and the utmost advantage is made of it by Mr. H. Gillett, its indefatigable secretary, and the committee. This year the schedule of prizes had been considerably extended, with the result that there was an increase of entries. Non-competitive groups of plants, cut flowers, &c., arranged by members of the trade, were extensive, and contributed greatly to make the show a success. Vegetables were shown in quantity and in excellent condition, both in the open and other classes, and fruit was fairly meritorious. A tent was set apart for Sweet Peas, which, for the season, were well shown, the leading exhibit being excellent. Table decorations, bouquets, and other decorative subjects were splendidly staged, but collectively Roses were weak. The Glamorgan-shire Bee Keepers' Association had a tent in the grounds, and the band of the Coldstream Guards was in attendance.

For cut flowers, Roses, twelve varieties, three blooms of each, the King's Acre Nursery Company, Hereford, secured the leading place with good blooms for the season; Mr. Crossling, Penarth, was a close second.

Twenty-four blooms: First, the King's Acre Company; Mr. Stephen Tresseder, Cardiff, was a good second.

Eighteen teas: The King's Acre Company again took the leading position.

For twelve, any variety, except Tea and Noisettes: First, the King's Acre Company with A. K. Williams.

Twelve either Tea or Noisette: Here again the King's Acre Company took first with The Bride.

Collection of Roses in space 6 feet by 3 feet. With a capital lot of good varieties, Mr. Crossling here took the lead, Mr. S. Tresseder a near second.

Collection of hardy flowers: Only two exhibitors staged in this class, and of these Mr. W. Tresseder, Cardiff, secured first place with a splendidly arranged exhibit of choice herbaceous subjects. Messrs. Stokes and Son, Trowbridge, also had an almost equally good stand, in which they had a fine new blue, free flowering dwarf Campanula named Hillside Blue, a cross between C. pyramidalis and C. carpatica.

Collection of Carnations and Picotees, 6 feet by 3 feet: This was an excellent class, in which Mr. Pike, Llanllyfenni took the coveted position, followed closely by Mr. W. Tresseder.

Sweet Peas: In a class of eighteen distinct sorts, four exhibitors staged good collections, and of these Messrs. Jarman and Son, of Chard, had the best; Mr. Jones, gardener to Sir Thomas Morel, was placed second.

Twelve vases: Mr. Adey, Penarth, took the lead here with a beautiful stand; Mrs. Jenner, Wenvoe, was placed second. There were six entries.

Twelve varieties: Prizes offered by Mr. Sydenham of Birmingham. Here Mrs. Jenner was placed first, Colonel Sandford second, and Dr. J. L. Thomas third.

Six vases: First, Mrs. Jenner; second, Sir Thomas Morel. A single vase of three varieties made a good class, the chief place being taken by Mr. W. T. W. Lewis, Llandaff; Mrs. Jenner second. For a basket of Sweet Peas, Mrs. Brukevich took the lead.

PLANTS.

Two stove and greenhouse plants in bloom and two ornamental foliaged plants: First, Mr. Cypher, Cheltenham; Mr. Carpenter, gardener to W. J. Buckley, Esq., was second. Six dinner table plants: Mr. Bastin, gardener to Sir A. Henderson, was placed first in this class amongst eight competitors, and Mr. Wall, gardener to Mrs. E. Davis, Llandaff, second.

Groups of plants, 150 square feet: Mr. Cypher, who arranged a splendid group in his well known manner, easily took the lead, Mr. Carpenter coming second with a fairly good exhibit. Group 50 square feet: Amongst four who entered in this

class, Mr. Wall took chief honour. Mr. Carpenter was second with light graceful groups. Mr. Waldron, Llandaff, was first with a group of 25 square feet.

DINNER TABLE DECORATIONS.

For a table 8 feet by 4 feet, arranged with fruit and flowers, Miss Ellis won leading honour, with a light pretty display of Aquilegia and Asparagus, arranged in vases; Miss Crouch was placed second, with a table dressed with Shirley Poppies and pink Ivy-leaved Geraniums, but the vases used were large for the size of the table. The last-named exhibitor, however, secured the lead for a table 3 feet 6 inches by 4 feet, and used similar flowers in each case; Mrs. Ainsley was a good second.

Bouquets and similar subjects were best shown by Mr. W. Tresseder, who took first place in the following classes—namely, bridal bouquet, bouquet with Orchids excluded, bouquet of Roses, two baskets of flowers, one basket of flowers, and a lady's spray. These exhibits were excellent in their way, and were greatly admired.

VEGETABLES.

These were splendidly shown, both in the open, amateur, and cottagers' classes.

Collection of nine dishes: First, Mr. Beckett, gardener to Lord Aldenham, with a superb lot, comprising Red Rocco Onion, Pea Duke of Albany, Cauliflower Early Giant, New Intermediate Carrot, Potato Snowdrop, Tomato Sutton's Perfection, Pea Duke of Albany, Globe Artichoke, Canadian Wonder Bean, and Vegetable Marrow Pen-y-Byd. Mr. Bastin, gardener to Sir A. Henderson, Buscot Park, was deservedly placed second.

Six dishes: Prizes given by Messrs. Sutton and Son: First, Mr. Bastin, with a strong exhibit.

Six dishes: Prizes offered by Messrs. Webb of Stourbridge. Here Mr. Beckett again led, with grand dishes of Cauliflower Early Mammoth, Tomato New Vicory, Potato Motor, Pea Stourbridge Marrow, &c. Mr. Bastin was a good second.

FRUIT.

Collection of six varieties: Mr. Bastin was a good first with Pine-apple Nectarine, Grape Black Hamburg, Brown Turkey Fig, Royal George Peach, Latest of All Strawberry, and Best of All Melon.

The Affiliated Societies' Challenge Trophy (silver bowl) was secured once more by the Margam district, the Llanllyfenni district second, and St. Fagans third.

THE ROYAL HORTICULTURAL SOCIETY'S MEDALS

were awarded as follow: Gold to Mr. Farmer, Cardiff Castle Gardens, for group of stove and greenhouse plants, and to Messrs. Hill and Sons, Barrowfield Nursery, London, for a grand collection of Ferns. Silver-gilt Flora to Messrs. Blackmore and Langdon, Bath, for Begonias, and to Mr. Cypher for group of plants. Silver Flora to Mr. Carpenter for group of plants, Messrs. John Russell for group of ornamental shrubs, Mr. W. Tresseder for collection of herbaceous flowers, the King's Acre Nursery Company, Hereford, for Roses, and Messrs. B. R. Davis and Sons for collection of Begonias. Silver Knightian to Mr. Farmer for Vines fruiting in pots, Mr. Bastin for collection of vegetables, and Mr. Beckett for collection of vegetables. Silver Banksian to Mr. Brown, gardener to J. Howell, Esq., for specimen Ferns, Messrs. Barr and Son for hardy flowers, Mr. M. Prichard for hardy flowers, and Mr. John Waterer for ornamental trees and shrubs in pots. Bronze Flora to Messrs. Stokes and Sons for hardy flowers. Bronze Banksian to Mr. Jones, gardener to Sir Thomas Morel, for Sweet Peas, Messrs. Jarman and Co., Chard, for Sweet Peas, Mr. Mellens for flowering plants, Mr. J. E. Deacon for vegetables, and Mr. F. Maers for vegetables.

CROYDON AND DISTRICT HORTICULTURAL SOCIETY.

PROGRAMME OF MEETINGS FOR 1903.

August 18, "Summer Pruning," by Mr. A. Maalen, Bramley Hill House Gardens, Croydon. September 1, "Discussion on Floral Decorations, with Demonstrations." Members are invited to make a display of floral designs. September 15, "Cryptogamic Plants," by Mr. G. W. T. Shrubhall, Ion Nursery, Thornton Heath. October 6, "Horticulture in America and Canada" (illustrated), by Mr. J. Cheal, Crawley. October 20, "A Year's Work in the Vineyard," by Mr. W. Taylor, Tewkesbury Lodge Gardens, Forest Hill, S.E. November 6 (Friday), "Fruit Bottling," by Mr. R. B. Leech, Wood Hall Gardens, Dulwich, S.E. Lady friends of members cordially invited to this lecture. November 17, "How Plants Grow," by Mr. H. O. Etherington, manager J. R. Box's nurseries, West Wickham. December 1, "Selection of Winter and Spring Flowering Trees and Shrubs," by Mr. F. Humphreys, Royal Horticultural Society's Gardens, Chiswick. December 15, "Some Gardens I have visited" (illustrated), by Mr. J. Gregory, 60, Canterbury Road, Croydon.

Note.—The committee desire it to be known that a register is kept for the members' use, and any who are requiring situations should give particulars to the hon. sec.

Members are particularly invited to bring exhibits to the meetings. Essays for competition are invited from members under twenty-five years of age. Hon. Sec., Mr. Harry Boehler, 62, High Street, Croydon.

BOOKS.

Orchids: Their Culture and Management (Upcott Gill, Strand).—This book is well known. Its appreciation by those who require simple advice about the growing of Orchids is the test of its worth, and that an entirely revised and greatly enlarged edition should have been called for is further evidence of its

popularity. As many will remember, the first edition was written by Mr. Watson, curator of the Royal Botanic Gardens, Kew, but owing to the pressure of official duties he could not undertake the arduous work of revision. This has been entrusted to Mr. Chapman, whose great knowledge of Orchids fits him for so important a task. There are many illustrations, several very good coloured plates, and an excellent list of references to where coloured and other drawings can be found of those species, varieties, or hybrids not figured in the work. There are about 550 pages of well printed texts and copious lists of hybrids and crosses with their parentage. It is as complete and simple a guide to Orchid culture as the beginner or anyone else can desire.

The Book of the Daffodil.—A capital little book about the Daffodil, which has grown out, as the author says, "of a paper on the 'Cultivation of the Narcissus in Gardens,' read before the Royal Horticultural Society in the year 1900 (Journal of the Royal Horticultural Society, vol. xxv., page 39)." There are chapters upon every conceivable phase of this beautiful flower, and all we can say to those who want to know all about Daffodils is "buy it." The following words of the author are so truthful that we repeat them: "It is a flower we cannot do without, this Daffodil or Narcissus. Whether after the popular manner we adopt the prettier and more easily pronounced word and call it 'Daffodil' (though 'Daffodil' is really only a sectional name), or whether with more scientific people we keep to the well-established name of the genus and speak of it as the Narcissus, it is a plant which the ardent gardener feels he must grow as soon as he sees it in some of its finer forms. It is a plant which has asserted itself much of late and with good reason. Its numerous varieties supply a very real need in our gardens, and occupy a prominent position in the year's procession of beautiful flowers growing hardily in the open ground; they delight us at a time when cut flowers from the open border are very scarce; many of them rival in beauty the choicest treasures of the greenhouse and hot house. With accommodating persistence they bloom in succession for nearly a quarter of a year—i.e. (in ordinary seasons) from the beginning of March to the middle of May—without exacting from us any trouble and expense in supplying them with artificial heat; when cut their flowers (most of them) last in water for ten days or even more, and although there is a certain amount of truth in the objection that it is easy from a large collection to pick out a number of sorts which are rather similar in character, it is still easier to select a very large number which are far more distinct from each other than Rose from Rose and Carnation from Carnation."

Bulletin of the French Horticultural Society of London.—We little thought thirteen or fourteen years ago that this society was destined to make its way in the world to such an extent as it has done. The Bulletin for the past year is recently to hand, and this, with past issues, proves what may be done by a few earnest workers who can combine ability with industry and enthusiasm. A substantial volume of 164 pages contains the records of last year's work, and it must be gratifying to everyone concerned. Thanks to the encouragement given to the society by the various organs of the English horticultural Press, the aims of the French Horticultural Society of London are now fully known and appreciated, a fact easily recognised by those who attend its annual gatherings. The genial president, Mr. George Schneider, has given much time and wise supervision in the management of the affairs of the society, and has been aided by many of his compatriots in the work. The result is that many young Frenchmen, Belgians, Swiss, and others have been able to spend a period here in England to complete their horticultural education, and that some young English gardeners have been enabled to make a stay on the Continent for a similar purpose, who would probably never have had the opportunity but for this society. Financially and numerically there appears to be considerable

* "The Book of the Daffodil." By the Rev. S. E. Bourne. Lane, Vigo Street. Price 2s. 6d. net.

increase. Most of the well-known horticulturists at home and abroad are recognised supporters, and the young men who avail themselves of the society's influence go forth to occupy prominent positions in the world and to follow honourable and responsible careers. The volume contains amongst other things a portrait of the late Charles Maries, the rules of the society, a list of the books in the library, and reports of the monthly meetings, with the text of papers read by the members, many of which are interesting and instructive. Some of the subjects dealt with are "The English Culture of *Hydrangea hortensis*," "The Chrysanthemum," "Dwarf Roses," "Useful Plants in Senegal," "Euphorbia pulcherrima," "Nepenthes," "Indiarubber," "Cider Apples," &c. The headquarters of the society are 66, Long Acre, W.C., and every information concerning it can be obtained from the secretary upon application by letter.

THE KITCHEN GARDEN.

SOWING CABBAGES FOR EARLY SPRING CUTTING.

FROM July 20 to the end of the month is an important date for growers of vegetables who value the early supply. Personally I think a small Cabbage in March far preferable to a coarser one two months later. Opinions differ as regards dates of sowing, but so far we have had the greatest success from July sowings if the seed bed is not crowded and freely exposed. There are other points, for instance July at times is hot and dry, and I have known the seeds remain dormant for some time. This affects the season, as it must retard growth greatly. I am aware there are other difficulties, such as in wet or showery seasons, the seeds sown too early make a coarse growth, but even then there are two courses to pursue. It is not necessary to rely upon the largest plants in a good sized seed-bed, as there are always a number of small ones. To prevent waste the large plants may be planted rather close and cut over for autumn greens. There are other considerations, for instance the dates of sowing will not be the same in all parts of the country. It will be better to make two sowings or even more than one large one at the same date in Scotland and in Cornwall, and in any southern county two sowings are best, as then there is a much longer supply, the second sowing taking place from August 10 to 15.

I am not in favour of later sowing, as should we get an unfavourable autumn or winter the plants suffer badly, and the season of cutting is much retarded. I well remember birds eating the seed many years ago. They are most troublesome if not checked, and at times the seed is blamed. I think the early Cabbage crop is one of the most important to the gardener, as the quality in March and April is far better than in June and July. What is wanted is a sturdy plant. These placed in their growing quarters when not too large are much better than those put out later, and the plants are three times the size. I am also an advocate for firm planting, as loose or thin soil promotes a rapid growth at the start. This is cut down later on. It is also important not to sow the seed or grow the plants on land just cleared of a Brassica crop. If possible give a few seasons' rest, as by so doing there will be less fear of club and other pests. An open quarter gives the best return.

G. WYTHES.

MARROWS AND MANURE.

THERE is nothing much harder to kill than an old garden custom, and it is curious how certain of these have established themselves in relation to the culture of garden crops. I have no idea who the gardener was that first devised the idea of growing Vegetable Marrows on a manure heap, but he certainly got a following, and, by the way the practice is followed, it might seem as though Vegetable Marrows refuse to grow under any other conditions. But it is all a fallacy; the Vegetable

Marrow is no more in need of a heap of manure to grow in than any other plant, and why gardeners should stick so closely to the custom is a puzzle to me. In scores of instances the heaps of manure that have been used for making hot-beds are retained, and, after placing a barrowful of soil on the top for planting in, the Marrows are left to root away of their own free will in the manure beneath.

I will admit that this is a good method if one wants to grow giant leaves and plenty of stem, but manure-heap grown plants never last so long nor fruit so freely as those grown under more natural conditions. For my part, I prefer to grow Marrows in a good piece of ground in the open garden, where they get the influence of the sunshine. By this I do not suggest going to the opposite extreme and growing the plants on a poverty-stricken principle, but take out a barrowful or two of soil, shovel some decayed manure in the hole, replace the soil, and then plant. Less rampant growth and smaller leaves are the result of this treatment, but the plants are not so liable to fail in dry weather, and continue fruiting longer than manure-grown specimens. Another mistake often made with Marrows is that of growing them in some out-of-the-way corner of the garden that would not be considered good enough for anything else. Even under such conditions they are not always disappointing, but, considering that the Marrow is one of the most acceptable and useful vegetables in the garden, it is deserving of a good position and proper treatment at the hands of the grower.

G. H. H.

Floods in the Lea Valley.—Amongst the many sufferers from the recent floods, probably to none has the result been more disastrous than to Mr. F. Scholes and his brother, who occupy some four acres and a half of land near Lea Bridge Station. Owing to the proximity of the local gas works, the flood water was charged with ammoniacal liquor and other deleterious refuse, and the destruction of their growing stock, consisting of hardy perennials, &c., is most deplorable, the loss being accentuated by the fact that the seed-beds, from which the land would be planted, have suffered greatly. Dismayed by the trouble by which they have been overtaken, Messrs. Scholes have appealed to me to know if anything can be done to assist them, and, having seen how great is the destruction, I am sending this statement, and would deem it a favour if you would insert it in your valued journal. I shall be pleased to acknowledge any sums your generous readers may send to me, and will ask a few prominent growers to associate themselves with me in the disposition of the fund.—H. B. MAX, *Dyson's Lane Nursery, Upper Edmonton, N.*

Mr. W. Pope.—We are very sorry to learn that Mr. William Pope, the widely-esteemed head gardener at Highclere Castle, Newbury, the Berkshire seat of the Earl of Carnarvon, has met with rather a serious accident. Mr. Pope was cycling recently, and had the misfortune to fall and break his thigh. At a meeting of the fruit and vegetable committee of the Royal Horticultural Society (of which Mr. Pope is a member and regular attendant) on Tuesday last a vote of sympathy was passed with him, and the hope expressed that he would make good progress towards recovery.

Rosa rugosa × Polyantha.—This is a natural hybrid, and partakes of the tree or bush-like habit of *rugosa*. The flowers are white with curious serrated margins, and borne in terminal conical trusses; it is perfectly sterile, and has the delicious fragrance of *Rosa polyantha*. Here it forms a tree 7 feet high by as much through.

Iris ochraurea (see page 38).—The flowers sent were not *I. ochroleuca*, but a cross between that species and *I. aurea*. Its flowers are larger than either, and the colouring is midway between the two, whilst it is a week or ten days later than *ochroleuca*, and, as seen growing side by side, a better plant.—T. SMITH, *Newry*.

A cottage and amateur gardening competition.—It is pleasant to know that the enthusiasm of Lady Algernon Gordon-Lennox, who

started "The Cottage Garden and Amateur Horticultural Competition" for the counties of Oxfordshire, Northamptonshire, and Warwickshire, is having its full reward. The next display takes place on Monday next, the 3rd inst. (Bank Holiday), at Broughton Castle, which is two miles and a half from Banbury, Oxon. The most valuable prize is the "Lennox" Challenge Cup, value 50 guineas, to be held by the society gaining it for one year. Should any society succeed in winning it three years in succession it will become their absolute property, and it is interesting to know that the cup is at present held by the Banbury and District Horticultural Union. The object of this horticultural competition is to encourage a keener spirit of rivalry than already exists amongst the members of rural horticultural associations and societies, and also with the hope that an impetus may be given to the labours of all those who, while keenly interested in horticulture and the cultivation of allotments, have yet little opportunity of being brought into contact with other districts, and thereby judging of what is being accomplished elsewhere. There is no desire whatever to interfere with local flower-shows, but rather to stimulate interest in them. In Lady Algernon's district round Banbury it has been proved that the produce required for the cup collection has in no way detracted from the quantity or quality exhibited at the local shows, but that the societies have benefited by the prizes which the Banbury and District Horticultural Union has offered to the various societies in affiliation with it. A short conference will take place during the afternoon of the show. We wish Lady Algernon Gordon-Lennox success in her interesting and instructive work. Anything that tends to the bettering of the rural population deserves the heartiest support, and we hope the excellent example set may be followed in other country towns. Miss Willmott is working in much the same way at Warley.

Hemerocallis citrina, Baroni in N. giornale Bot. Ital. IX.—There are evidently two distinct and different plants in cultivation under the above name, both of which are now in flower in my garden, and from what I can learn I think one of them must be a species from Lun Tan in China, by the late Padre Giraldi, and the other probably a garden hybrid. I received the species from a new plant collector at Naples, who said its flowers opened in the evening, instead of, as the flowers usually do, in the early morning. In this, however, he was wrong, as my first flower opened in the early morning. The other variety came to me from a well-known English nurseryman, and opened its first flower on the evening of the same day. The plants mainly differ in their habit of growth, the colour of their buds before opening, and the size of their flowers. The species is a much stronger grower, with foliage of a deeper shade of green, and much broader than the other; it is also of a much more caulescent habit. Its stem is much stronger and taller, being 3 feet 5 inches in height, whereas the other flower-stem is only 1 foot 10 inches high. The former bears sixteen flower-buds with distinctly black tips, while the latter has only five buds, which are entirely green. The length of petal of the flower of the species is 5 inches, that of the hybrid just over 2 inches, but the flower is more perfect and perhaps more beautiful, from the petals being broader and more nearly approaching one another than those of its larger but somewhat unevenly-formed brother. The colour of both is almost identical—namely, a clear pale canary yellow. I consider both of them to be acquisitions to our gardens, and the species is said to be the hardiest of its family.—W. E. GUMBLERON.

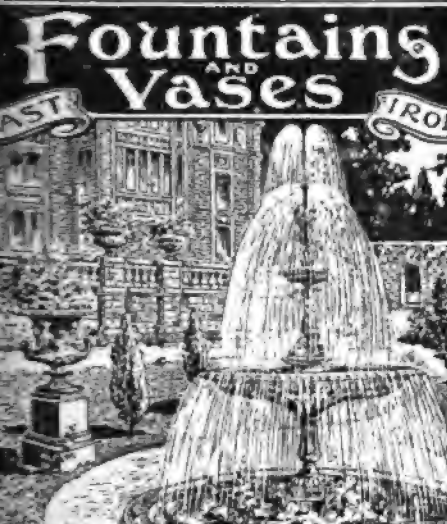

Violas in Regent's Park.—Hundreds of people are delighted with the Viola bed in this park. The happy combination of big irregular-shaped masses of some of the most distinct and showy of these plants, placed as they are on an undulating mound, is worthy of imitation. It is the bold clumps of irregular sizes, or a big, gently sloping mound, that creates the surprise, and in which such sorts as Molly Pope, William Neil, Sylvia, and Blue Diamond figure most conspicuously.—VISITOR.

Wear and Tear of City Life.

Why do so many of our City men look so sickly? Because they drink too much tea, and when are fagged out cannot take more substantial and nutritive food. The system thus gradually becomes enervated and debilitated; there is no relish for food, no energy for work, and the whole of the physical and mental condition becomes seriously impaired.

One City Clerk—Mr. H. W. Elliott, 23, Norfolk Street, Cannonbury, N.—writes:—"I work late hours, but I find Dr. Tibbles' Vi-Cocoa a delicious stimulating drink. My doctor, grocer, and friends all speak very highly of it."

And if you use Vi-Cocoa regularly you will speak highly of it too. Sold in 6d. packets and 9d. and 1s. 6d. tins everywhere.

SATISFACTORY QUALITY.

Chironia exifera.—When visiting Impney Hall Gardens, Droitwich, recently my attention was drawn to this plant by Mr. Jordan, the gardener there. It is grown in some quantity at Impney, and proves invaluable for indoor decoration. This plant, which belongs to the natural order Gentianaceæ, grows from 2 feet to 3 feet high. It has pretty grey Carnation-like leaves, and bears freely roundish purple-pink flowers about half an inch across. Not only do the plants make a good show, but flowers are produced over a considerable period. Mr. Jordan propagates this plant by means of cuttings, and finds no difficulty in doing so. By inserting cuttings in March, June, and July a succession of bloom is had during the following summer. The greenhouse is often at its worst during the summer and early autumn months, and *Chironia exifera* is just the plant that is wanted. The flowers make an exceedingly pretty table decoration, and they are also most useful for mixing with groups of plants in the house or elsewhere. On several occasions in prize groups at some of the provincial exhibitions, where the arrangement of plants for effect is an important feature, I have noticed this plant has been used. Good use has also been made of it in some of the decorated dessert tables at York and other large flower shows, and many have asked its name. This note may serve to recall the plant.—A. P. H.

A novel dinner-table decoration. This may well describe some good work carried out recently by Messrs. G. W. Bellgrove and Co., Fulham Palace Road, Hammersmith, at the residence of Mrs. Avery, 31, Grosvenor Square. In the centre of the table was an artificial lake filled with gold fish and the best varieties of Water Lilies, the centre piece being of rare shells with electric lights inside. The outside of the pan was hidden by a mass of water weeds and grasses, also electric lighted. A canopy of Bamboo was a striking feature. This measured 20 feet by 8 feet, and was covered with *Wistaria*, *Clematis* (ranging from mauve to dark blue), *Convolvulus*, and *Apple blossom*. These flowers were artificial, and were obtained in Paris, and well illustrated the pitch of perfection to which our neighbours across the Channel have carried this class of work, so natural were they in appearance.—Quo.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 30, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—F. W. Harris.—*Phlomis fruticosa*.—M. H.—The crimson flower is *Spiraea palmata*, and the other *Diplocephalus chrysophyllus*.—Geo. Barham.—1, *Melia Azedarach*; 2, *Veronica speciosa* var.; 3, *Valeriana officinalis*; 4, *Lepidium Smithii*; 5, *Jasione montana*; 6, *Stachys palustris*.—M. P. Lenox-Conyngham.—The one-leaved Ash (*Fraxinus excelsior heterophylla*).—C. E. Fletcher.—*Amelanchier vulgaris*.—Belbroughton.—Roses: A, *Florea*; B, *Devoniensis*. The leaf is that of *Cladrastis tinctoria*.—C. L. Adams.—The Rose is *Florea*.

Vine leaves withered. (A. D. R.).—The leaves and stalks of the specimen leaves sent for our inspection are dried up and dead. As you say that the foliage of one Vine was completely destroyed in this way and others more or less affected, and that the damage occurred in one night, without knowing something of the general health of the Vines and the conditions under which they are grown, it is difficult to suggest a cause for so sudden a collapse. All we can do is to call to mind cases somewhat similar which have come to our notice before and draw certain deductions. By the size and substance of the leaves sent we should conclude that the Vine affected had been in an indifferent condition of health for some time, and that the extreme heat of the past few weeks has proved too much for its enfeebled constitution to stand, coupled with the fact that the leaves are infested with red spider, hence the sudden breakdown. We have also seen similar results brought about by a too strong application of some insecticide. You will know whether this will apply in your case. Your best course to

pursue now will be to shade the glass over the Vines with a thin coating of lime water whilst the weather continues so hot. Give abundance of air night and day, and towards the end of October take away a portion of the old border and substitute with new soil. By this means new vigour will be imparted to the Vines and their health re-established in due course.

Tall Lilies in succession, &c. (J. McDONALD).—Suitable Lilies for the purpose you name are *Lilium auratum*, 4 feet to 5 feet, July and August; a. *platyphyllum*, 5 feet to 6 feet, July and August; *candidum*, 4 feet to 5 feet, June and July; *croceum*, 3 feet to 5 feet, June and July; *exceolum*, 4 feet to 6 feet, June and July; *Henryi*, 8 feet to 8 feet, August; *longiflorum* (Japanese bulbs), 8 feet to 4 feet, July; *avotizianum*, 3 feet to 5 feet, end of May and in June; *speciosum Kretzeri*, 3 feet to 4 feet, August and September; a. *Melpomene*, 3 feet to 4 feet, August and September; a. *roseum*, 8 feet to 4 feet, August and September; *tigrinum splendens*, 5 feet, end of July and in August; *umbellatum erectum*, 2 feet to 3 feet, end of May and in June. All of the above Lilies will give a good display the first season after planting, except *L. avotizianum*, which needs to be thoroughly established before it is seen at its best. *Lilium candidum* requires to be planted soon after the flower-stems decay, that is, by the middle of August at the latest. With regard to the plan sent, the two narrow serpentine beds flanking a group of specimen *Pyrus* appear to us very suitable for the position. The ground beneath the *Pyrus* may be carpeted with *Chionodoxa Lucillie* or *Scilla sibirica*, thus imparting a pleasing bit of colour early in the season. Of the flowers you name, exception may be taken to the Japanese Iris, which need a much moister soil than any of the other subjects you mention. A selection of the better German Iris might be substituted, or some members of the bulbous-rooted Spanish and English Iris would form a good succession to the early Tulips. A group of *Hyacinthus* (*Galearia*) *candicans*, associated with bright-coloured *Gladioli*, forms a showy feature in August. The *Tritomas* or Torch Lilies are worthy of consideration as late season flowers.

Insects on Broom. (J. C. GARNETT).—The little creatures infesting your White Broom are not ticks, but one of the mites belonging to the Oribatidae, or "beetle mites." They will not injure the plant in any way, but if you want to get rid of them, spray the plant with paraffin emulsion, or some other insecticide of a similar nature.

Iris. (Miss E. L. MAW).—We believe you will find the many forms of the Flag Iris, *I. germanica*, best suited to your purpose. These are so showy and varied. The best time for planting is April, that is, for planting and dividing; next to this, quite early in September. It is not necessary to keep the rhizomes on the surface, but if buried partly they will rise, or the soil will settle about them. Do not attempt planting large tufts, as from three to six to form a patch or group are much better. The following are good and free flowering: Mrs. H. Darwin, nearly pure white; aurea, golden; Darius, yellow; L'Innocence, pure white; Arnold's, smoky bronze; Mme. Chereau, white, with violet lines; pallida, very fine pale blue; pallida dalmatica, a larger flower than the last and darker, very handsome; Queen of May, rosy lilac, very beautiful; Walner, azure blue; Dr. Bernice, crimson and bronze; Chelles, yellow. Other suitable ones are *I. ochroleuca*; *I. aurea*, the species, not No. 2 of the above selection; *I. missouriensis*; *I. Monspur*, &c. You could also try a few of the bulbous Spanish Iris that flower later than the foregoing, and that lovely yellow *I. juzeau*, a most valuable bulbous kind. All the Spanish Irises are much at home in a rather dry place, or at least well-drained soil.

American blight. (AMATEUR).—We understand and appreciate our correspondent's difficulty. The condition of the Apple trees, although it is as bad as it well can be, does not appear beyond hope of improvement. Had the condition of the lease permitted, the better and more successful way, no doubt, would have been to grub up the trees and plant young, clean, and healthy stock. Should some of the trees be very decrepit we should advocate cutting down and regrafting on the old stem (see illustrated article on "Grafting" March 21, 1903). This, we presume, could be done without contravening the conditions of your lease. By this treatment you would secure new, healthy, vigorous, and fruitful trees in a comparatively short space of time (three or four years). Apart from the above suggestions, we give you the best advice at our disposal. In the first place undiluted paraffin should never be applied to the bark of fruit trees. If used in this strength to any extent over the whole tree it is bound to do much harm, will cripple the trees for years, and in some cases will kill them outright. As regards the pruning of the trees, you are quite right in taking the means you suggest, namely, as soon as the leaves have fallen in the autumn to cut out all dead wood and to shorten back the worst branches to where they are healthy. Healthy young growths will proceed eventually furnishing the tree with branches. We would not advise cutting too many branches out in one year, but a few each year over a number of years. Cut the affected part carefully from the branches left with a knife, taking care, of course, not to cut beneath the bark of the tree. As soon as the pruning of the trees and the cleaning of the blighted parts is finished the prunings and scrapings should be carefully collected and at once burned. Burn also at least 1 inch of the surface soil as far as the tree branches extend. The next proceeding should be to wash the trees, scrubbing them well all over with warm soapuds, or in the absence of this with soft soap and warm water (a wineglassful to a gallon of water). Afterwards paint the trees with the emulsion below mentioned. So much as regards the tree above ground. To bring the trees back to health and fruitfulness the roots must have some attention also. Should the trees be growing on grass land the turf round the stems must be cleared away to a distance of 4 feet all round, and substitute a layer of rich, well-rotted manure. The rains in the course of the winter will wash down the ammonia from this manure, stimulating and nourishing their roots, and an occasional watering during winter with manure water from the stable or cow yard will do much

good. If the trees are growing in cultivated (not grass) land the same remarks are applicable. The following year, and perhaps succeeding years, the American blight will cease to make its appearance more or less. The cultivator should be on the watch and apply the emulsion to the affected parts with a brush. If this vigilance is continued for a few years complete immunity from this dreadful pest may be obtained. Emulsion: To a gallon of hot water add the following ingredients— $\frac{1}{2}$ lb. soft soap, $\frac{1}{2}$ lb. black sulphur, $\frac{1}{2}$ pint tobacco juice, and $\frac{1}{2}$ pint of paraffin. Mix all together in a mortar. Dilute by adding 2 gallons of warm water, making 3 gallons in all, before using.

Grafting. (AMATEUR).—We are glad to hear that our recent illustrated article on grafting has been of assistance to our correspondent, and that complete success in his case has followed on the instructions given. With reference to the question of taking off the clay, we would advise that it be retained for another three weeks or a month, while the sun is hot and evaporation rapid. It may be taken off towards the end of August. The grafts must be supported by stakes immediately the clay is removed, or they may be shaken by rough winds and the cohesion of stock and graft destroyed. Stakes for this purpose may be firmly secured to the stem of the tree and the grafts tied to them, or longer stakes driven in the ground will answer the same purpose. These supports should not be moved until the grafts are properly secured to the stock.

Verbascum. (W.).—The flowers of your *Verbascum* were badly withered on arrival, which made it impossible to identify them correctly, especially as no leaves were sent; it, however, looks to be very near *V. Chalcidii*, probably a hybrid, with that species as one of the parents. Bees probably carried pollen from some other garden. It is hardly worth submitting to the Royal Horticultural Society for a certificate, but there is no harm in doing so.

Peach and Nectarine fruits falling. (J. B. P.). We never remember a season when complaints of Peaches and Nectarines dropping their fruit before completing the process of stoning have been more general than they are this year. We notice that the complaints are more common as regards crops in late houses, early and mid-season crops not being so generally affected. The cause of the trouble we think must be attributed to the cold and sunless season of 1902, resulting in the failure of the proper maturation and ripening of the young shoots, this again resulting in the following spring in the production of weak and unfertile flowers—flowers with little or no pollen on the anthers—and consequently quite incapable of producing fruits. The bloom would apparently set alright, and swell to a certain size, but through imperfect fertilisation, when the stress of stoning time came round, the fruit would suddenly collapse and drop, as in our correspondent's case. All the specimens sent for our inspection, after cutting, were found to have partly-formed stones and all decayed. One of the most important precautions to take to avert similar failures in the future is to take care that the young shoots of the current year's growth (which are the fruit producers of next year) are not overcrowded by useless lateral and other growths, preventing their full exposure to all light and air possible. Another is to take particular notice in the spring, when the trees are in bloom, if the blooms are strong with plenty of pollen on. When this is the case a perfect set is assured, but when the flowers are weak and deficient in pollen, then patient and persistent artificial fertilisation must be resorted to by drawing a rabbit's tail over the flowers once or twice in the middle of the day when they are dry.

Garden names for certain plants. (CONSTANT READER).—There are no garden names for the plants mentioned, and all three would be difficult to obtain from nurseries. *Spiraea digitata* is a herbaceous species; native of Siberia. *Salvia virgata*.—This might be termed the Twiggy Sage. *Aconitum Cammarum stoeckianum* is a form of the Monk's Hood or Wolf's Bane.

ERRATUM.—Carnation Show, Drill Hall. Mr. Francis Wellesley, Westfield Common, Woking, writes: "An error has crept into your otherwise excellent report of the Carnation show. The first prize for twenty-four flakes and bizzars was awarded to me, and not to Mr. Thomas Lord." We well remember the stand, and congratulate our correspondent upon the beauty of the flowers exhibited.

TRADE NOTES.

THOMAS METHVEN AND SONS, nurserymen, seedsmen, and florists, 15, Princes Street, and Leith Walk, Edinburgh, have had the honour of receiving from the Lord Steward a Warrant of Appointment to his Majesty the King. The firm formerly held a warrant from her late Majesty Queen Victoria.

MESSRS. W. H. HUDSON, Chiswick, London, W., desire us to state that their seed, bulb, and Japanese Lily business is entirely carried on at 34 to 38 Chiswick High Road, London, W. The local retail shop at 199, High Road, Kilburn, has been disposed of to Mr. Golding, and has now no connection with Messrs. Hudson. All orders by post should be addressed to the Chiswick address.

PUBLICATIONS RECEIVED.

WE have received from Messrs. George Newnes Part XIV. of "The Century Book of Gardening." This deals with stove and greenhouse plants and Orchids. *The Wide World and The Captain* magazines for August are very bright, and make healthy reading for the summer holidays. *The Studio* for July is as bright and interesting as usual. Its contents are always varied.

CATALOGUE RECEIVED.

Bulbs.—Messrs. T. Methven and Sons, 15, Princes Street, and Leith Walk, Edinburgh.

*. The Yearly Subscription to THE GARDEN is: *Inland*, 15s.; *Foreign*, 17s. 6d.

THE GARDEN

No. 1655.—VOL. LXIV.]

[AUGUST 8, 1903.]

THE GROUPING OF TREES.

IF this subject were considered with only a reasonable amount of thought, and the practice of it controlled by good taste, there is nothing that would do more for the beauty of our gardens or grounds. Nothing can so effectually destroy good effect as the usual senseless mixture of deciduous and evergreen shrubs that, alas! is so commonly seen in gardens—a mixture of one each of a quantity of perhaps excellent things planted about 3 feet apart. There would be nothing to be said against this if it were the deliberate intention of any individual, for, as a garden is for the owner's happiness, it is indisputably his right to take his pleasure in it as he will, and if he says, "I have only space for a hundred plants, and I wish them to be all different," that is for him to decide. But when the mixture is made from pure ignorance or helplessness it is then that advice may be of use, and that the assurance may be given that there are better ways that are just as easy at the beginning, and that with every year will be growing on towards some definite scheme of beauty, instead of merely growing up into a foolish tangle of horticultural imbecility.

If the intending planter has no knowledge it is well worth his while to take advice at the beginning; not to plant at random and to feel, a few years later, first doubt, and then regret, and then, as knowledge grows, to have to face the fact that it is all wrong, and that much precious time has been lost.

In the August number of *Flora and Sylva* the Editor draws attention to this important question of the grouping of trees, and advice so sound as the following bears repetition, and may be well taken to heart by many of the landscape planters of the present day:—

"Of the many questions which the landscape planter has to face that of the forms and grouping of trees is the most important. A knowledge of them is absolutely needed in pleasure grounds, parks, and woods; not only the ordinary plantation or shrubbery of the country, but also in long-established woods. This knowledge is not only essential for good planting, but also from an artistic point of view. Nor must it be confined to one aspect only of even our few native trees. Take the Oak: how mistaken anyone might be as to its planting who knew only one expression of its beauty! The Oaks in the country south of London are quite distinct in aspect from those of Warwickshire. Yet the Oak, set close in a Sussex wood, with many silvery columns rising out of Primroses, is as beautiful as any of the fine Oak growths of the Shakespeare country.

And this is but one example of the variation of habit of one tree, showing the need for the study of trees in Nature, and not in books. If we travel in mountainous lands where Pines abound, we find that they grow close together, that the 'extinguisher' is not their true form, and that they shoot up into handsome stems, often over 100 feet high without a branch. It is a delusion to suppose that there is anything old or right about the common mode of planting conifers, as most of them are recent gains.

"Thinking of all this, how common it is in the first place we go into to see nothing but the muddled mixture of trees and shrubs from all countries and elevations and all characters jumbled together in one plantation, exactly the best thing being done to steal away all character and distinction and even good cultivation; for, eventually, the coarse things destroy the others, and the good and rare things have little or no chance, while the eye cannot see the real beauty of the forms or even colours of things, the common way destroying good colour as well as form. We may see the Wellingtonia planted near a window, and trees planted in conditions in which it is impossible for them to thrive to any good effect; and when we consider the many beautiful hardy trees and shrubs in our islands it is no wonder that men, busy in other ways, should make many mistakes in planting. But on the part of professional planters, so unmeaning a way should not be accepted; and the true one is unattainable without a knowledge of the loveliest gift of Nature to the earth—its trees."

EDITOR'S TABLE.

We invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

FLOWERS FROM COUNTY CLARE.

Mr. P. B. O'Kelly, Evergreen, Fern, and Shrub Nursery, Ballyvaughan, County Clare, Ireland, sends a variety of interesting flowers, but, unfortunately, when they reached us they were past their best. Mr. O'Kelly's note, however, is of much interest: "I enclose a bouquet of some choice and very rare flowers too numerous to mention. Enclosed is a leaf of the new *Aralia Moseri*, and amongst other things are *Veronica hybrida semperflorens*, *V. virginica*, *V. brilliantissima*, *Spiraea trifoliata*, and *Astrantia helleborifolia*.

VERBASCUM VIRGATUM

with purple anthers is a very rare and beautiful Mullen, and wholly unknown to the trade. It is the queen of all Verbascons. A well-grown plant will bear 5,000 flowers on its twiggy spikes. *Lychnis ciliata* is another good flower, also the Welsh Poppy, which continues to flower for

months. It is rarely seen in the garden of amateur or cottager, though it should be grown in every garden in the British Isles. The native *Orchis* should not be neglected. *Coronilla varia* is a fine trailing perennial with handsome lilac flowers."

THREE HARDY ORCHISES.

Mr. P. B. O'Kelly also sends three very pretty hardy Orchids, namely, *Orchis pyramidalis*, *Epipactis palustris*, and the fragrant *Gnat Orchis*, which our correspondent writes "should be found in every garden in the British Isles." We quite agree that the hardy Orchises are not too common in gardens—*Orchis latifolia*, for example, one of the noblest of all hardy and native plants.

CYRTANTHUS ODORUS, ANEMONOPSIS MACROPHYLLA.

We receive these from Messrs. De Graaf Brothers, Leiden, Holland. The *Cyrtanthus* is a striking flower. Its strong, chocolate-coloured stem supports an umbel of about a dozen flowers, each 3 inches in length, drooping and tubular, and red with green tips. It is a striking flower. The *Anemonopsis* is a hardy flower we are pleased to see. It is a Japanese plant reminiscent of the Japan Anemone, with shining leaves, and slender stems bearing soft purplish flowers. It is an interesting plant for a shady border. Messrs. De Graaf write: "The *Cyrtanthus* was imported by us from the Cape."

GALEGA PATULA GRANDIFLORA.

Mr. Hartland sends from Ardcarn, Cork, this pretty and rare variety, with blue and white flowers, from plants raised from seed. We hope to illustrate it, and then say more about it.

SOME BEAUTIFUL CARNATIONS.

I am sending for your table a gathering of Carnations from the open border. During the past week we have had torrents of rain, and while many of our border plants have suffered severely, the Carnations are little injured. We often hear it said that Carnations are so disappointing owing to the vicissitudes of the weather. Now this difficulty might easily be overcome by making a judicious selection of those sorts that invariably do well under the most trying circumstances. The following I find most reliable: Yellow Queen, Bracon Gem, La Villette, Uriah Pike, Ketton Rose, and the Redbraes Picotee.—T. B. FIELD, *Ashwellthorpe, Norwich*.

The flowers sent were remarkably fine and not in the least degree split in spite of the deluges of rain. The varieties named are not new, but the colours are pure and bright, and as our correspondent says: "The plants do well under the most trying circumstances." This is a strong recommendation.

FLOWERS FROM TORQUAY.

Mr. H. D. Palmer, Blythwood, St. Mary Church Road, sends many interesting flowers from Torquay with the following instructive note: "After thirty years in the Eastern Counties trying to grow tender shrubs, and succeeding fairly well, my health needed a warmer climate. I came here, and have been making a garden principally to grow shrubs and hardy perennials. I send you a few tender things that I planted two years ago, and

which have been out for two winters unprotected. They are on a south-east and south-west wall. The *Rhynchospermum* is flowering well, though at present small; but it is going up the wall well. The *Swainsonias* are on a south-east wall, and are growing fast and flowering profusely. I have also *Magnolia fuscata* in good health and flowering, but the flowers have fallen, and there are only now buds. *Clematis indivisa lobata* has got to the top of my house (25 feet) in two years, and is bidding fair to cover one side. Last March it was in fine flower. The new *Lonicera Hildebrandti* is on a south-west wall, and has gone up some 15 feet, but has not flowered as yet. What surprised me on coming to Devon is that so few gardens about here have anything in them but the ordinary hardy shrubs, when so many greenhouse shrubs and climbers might be planted with success. *Camellias* have flowered well with me and have made fine new growth. I am not in the hot part of Torquay, but some 350 feet above sea level, and get a good deal of east wind sweeping through my garden, and it seems at the time to be as cold as it was in the East of England. Yet things that I could only keep alive there by special means grow freely here with no protection."

CLEMATIS COCCINEA.

Mr. Max Leichtlin sends some very large blooms of this curious *Clematis*, with the brief and modest remark "*Clematis coccinea* improving." The flowers are not only much larger than any we have seen, but are of very fine colour, a strong rosy scarlet.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

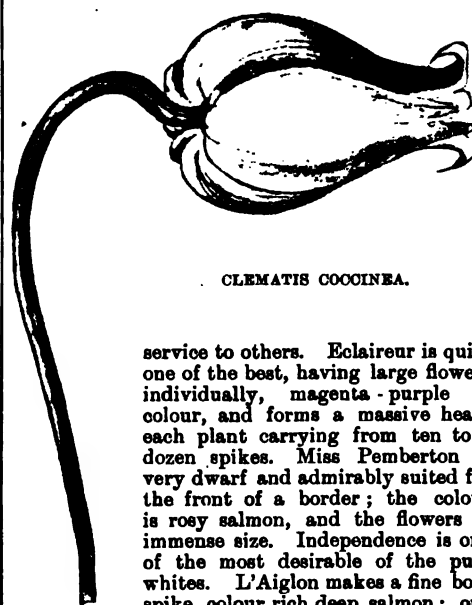

- August 11.—Clay Cross Flower Show; Rye District Flower Show.
- August 12.—Bishop's Stortford and Salisbury Horticultural Shows; East Anglian Horticultural Club Meeting.
- August 13.—Taunton Deane Flower Show.
- August 15.—Crewe Horticultural Exhibition.
- August 18.—Royal Horticultural Society's Committee meet.
- August 19.—Shrewsbury Floral Fête (two days); Eastbourne Flower Show.
- August 20.—Jersey Horticultural Exhibition.
- August 21.—Devon and Exeter Horticultural Show.

Notes from Baden-Baden.—*Indigofera Kirilowii* is a quite hardy dwarf shrub, covered with successive flowers from May to September. The foliage is a very bright green, and the large Grape-like flowers are a bright purplish rose colour. *Agapanthus umbellatus* *Saintpaulii* is a desirable novelty and a very distinct plant; the flowers are somewhat smaller than those of *umbellatus*, but they are very numerous—I counted over 120 in one umbel—and of a quite pure white colour; it is perfectly hardy, but to flower well should be taken up in autumn and kept dry all winter. Another good shrub is *Sorbaria sorbifolia* var. *stellipila*; it differs from the type by its flowers, which are arranged in a very tight panicle, the individual flowers having long hair like filaments, which produce a striking effect. Of *Clematis coccinea* I have by constant selection and constant sowings now produced a fine seedling, the flowers of which are three times as large as those of the wild plant. — MAX LEICHTLIN, *Baden-Baden*.

Nemesia strumosa Suttoni.—There are few interested in the flower garden who do not know this showy and effective annual. It will thrive in almost any soil and position, and will produce flowers so variable in colour that it has gained widespread popularity since its introduction. Not only does it make a grand display in beds and borders, but it does quite as well in pots. Plants from seed sown early in the spring, and pricked off about the middle of April (six to eight seedlings into 5-inch and 6-inch pots), have flowered profusely, making a nice change of flowers in the house.

Like other half-hardy annuals, plenty of air and light are essential to ensure sturdy plants, which are the most desirable. — T. B. F., *Buxted Park Gardens, Uckfield*.

Herbaceous Phloxes at Swanmore Park.—For making bold groups or for interspersing singly among other plants there is no class of hardy flowers more valuable than the herbaceous Phlox, and where a judicious selection is made of the better varieties, and care given in arranging the colours effectively, a very fine display is produced. It has been my good fortune upon more than one occasion, owing to the courtesy of Mr. Molyneux, to see the borders of hardy flowers which he grows so well at the Swanmore Park Farm, and there are few places where a better collection can be seen. The borders, which are about 50 yards long and 12 feet wide, have been so arranged as to make an easy curve, the termination being a very spacious and modern dairy. On either side of a gravel walk broad sweeps of grass give a splendid finish, and at the back climbing Roses are largely grown to form a background and shelter screen at the same time. Many of the herbaceous plants are grown in masses, and by careful discrimination Mr. Molyneux has produced an effect which may be better imagined than described. At the present time Phloxes contribute largely to this, and mention of the best may be of

CLEMATIS COCCINEA.

service to others. *Eclairer* is quite one of the best, having large flowers individually, magenta-purple in colour, and forms a massive head, each plant carrying from ten to a dozen spikes. Miss Pemberton is very dwarf and admirably suited for the front of a border; the colour is rosy salmon, and the flowers of immense size. Independence is one of the most desirable of the pure whites. *L'Aiglon* makes a fine bold spike, colour rich deep salmon; one of the most conspicuous. Mme.

Chauvry makes a fine effect in the mass; it is white, with a well-defined deep red eye. *Simplon* is pale salmon with a rich purple centre. *Goudan*, very distinct rich pink colour, and has a large truss. Jos. Gerbrand has very large flowers, white with a deep red eye. *Pantheon* is a beautiful rosy salmon, and most attractive. *Penge* is a dwarf grower, and an improvement upon *Miss Lingard*; it differs from this variety in having a deep red eye; the head is very compact and well formed. *Epopee* is similar in habit to *Eclairer*, but the colour is several shades paler. In *Cyrano* both spike and single flowers are large; the colour is rosy purple; *Lord Kelvin*, rich salmon-pink. *Roger Marx*, deeper in colour than *Miss Pemberton* and taller. *Etna* and *Coquelicot* are very much alike, but in many soils, especially those of a heavy texture, *Etna* has the better constitution; the colour is a deep orange-scarlet. — A. E. THATCHER, *Elstree*.

Sales of flowers at shows—a suggestion.—It frequently occurs that at the end of a show many of the cut flowers are disposed of. It is quite possible that were the matter brought prominently under their notice by secretaries, &c., exhibitors would gladly devote some of the proceeds to, say, that admirable charity the Gardeners' Orphan Fund; indeed, this would serve as an incentive to purchasers, as a double purpose

would be served, that of personal gratification at having received some trophy of the particular show, and that such outlay would go towards carrying on the truly excellent work of the fund; indeed, this idea is quite capable of some systematic development. Why should not every flower show throughout the kingdom have its recognised stall for the sale of flowers to benefit gardeners' orphans? At such stalls, too, literature (annual reports, &c.), in connexion with the fund could be distributed, thus tending to extend a knowledge of its grand work—much needed to secure an increased accession of subscribers.—Quo.

Roses at East Burnham Park. Quite recently Mr. Harry J. Veitch has made and planted in his charming garden near Burnham Beeches a Rose garden on turf. Here may be seen every good Rose, with strong-growing climbers or climbing and trailing hybrids, especially of the *wichuraiana* race, forming a fragrant border. A particularly free-blooming sort is *humilis rugosa*, the product of crossing those two single-flowered species. The flowers are rosy red in colour, and borne in remarkable profusion. Among the bedders the finest effect was produced by a mass of *Gruss an Teplitz*, a most profuse bloomer, with double flowers of a rich crimson-scarlet. This is undoubtedly a fine bedder. Very pleasing are the trained pyramids in which *Crimson Rambler* and the old white *Noisette Aimée Vibert* are intermixed. We have moved a long way in Rose culture since the days of mop-headed standards.—A. D.

Buddleia variabilis.—In general appearance this bears little resemblance to the best known member of the genus, namely, the Orange Ball Tree (*Buddleia globosa*), which has in many places flowered this year in great profusion. The globular masses of rich orange honey-scented blossoms form a striking feature, and at least in the south of England it is worthy of a place among the most select of flowering shrubs. On the other hand, the blossoms of *B. variabilis* are arranged in an elongated pyramidal-shaped raceme, which from its weight causes the points of the shoots to partially droop. In colour they are as indicated by the specific name, somewhat variable, being usually a pinkish lilac, with an orange throat. This *Buddleia* was introduced from Western China in 1893, and flowers in July and August. It is sometimes cut back during severe winters, but as a rule quickly recovers. Last summer a very fine form shown by Messrs. Veitch, under the name of *B. variabilis* *veitchiana*, was awarded a first-class certificate by the Royal Horticultural Society. Next to *B. globosa* this is certainly the showiest member of the genus, or rather I should have said hardy member, for the Himalayan *B. Colvillei*, which, unless in particularly favoured districts, needs glass protection, is when in flower really gorgeous.—H. P.

Notes from Farnham Royal.—At this time of year something interesting may always be seen at Woodside, where Mr. James grows so many things for seed production. Particularly attractive recently was *Pentstemon heterophyllus*; the flowers are of medium size, and of a light or electric blue colour. The average height of the plant is 10 inches. It comes true from seed, and may also be propagated by cuttings. Although not quite hardy, it should find a place in all mixed borders. A great quantity of double *Petunias* are grown in pots for seed production, but not one of these could compare for beauty and effectiveness, especially as a bedder or for pots or baskets, as a medium-sized single variety. It was one mass of bloom, of a self rosy carmine colour. Were it increased from seed true it should make a singularly popular *Petunia*. The fine strains of *Nemesia* in colours, both in the *Strumosa Suttoni* and the compactum forms, are indeed beautiful, and capital, as coming from seed, are the compact blue *Lobelias*. *Mignonette* is also very fine in pyramidal form.—A. D.

New Director of Agriculture, Bombay.—We are glad to see a new departure in the selection of Directors of Agriculture in India from among men who are acquainted with the subjects pertaining to the department they will be

called upon to control. Such a selection is that of Mr. Frederick Fletcher, son of Mr. Daniel Fletcher, of Unsworth, near Manchester, who has been appointed Director of Agriculture in the Presidency of Bombay on the recommendation of Lord Cromer. Mr. Fletcher was educated at Bury Grammar School, where he gained an entrance scholarship to St. John's College, Cambridge, and also a Lancashire County Council Agricultural Scholarship. For a few years he has been Professor of Agriculture at Ghizeh, near Cairo, and has devoted much attention to the study of diseases of the Cotton plant.—*Indian Planting and Gardening.*

Straight walks in kitchen gardens.—A straight walk in itself is usually an undesirable and uninteresting object in a garden; but in the utilitarian garden, where fruit and vegetables are grown, it is a necessity. And if uninteresting in itself, it is to a resourceful gardener an aid to forming features of interest and beauty. This conversion has been successfully accomplished by Mr. Allen, the head gardener at Hillingdon Court, where what would otherwise have been a narrow, monotonous walk, with vegetables on either side, is bordered by beautiful and sweet-smelling flowers. A wire trellis has been erected on each side of the walk about 5 feet high, leaving a border space on each side for plants that grow 4 feet high. In planting the idea has evidently been conceived and carried out of using chiefly sweet-smelling flowers. Thus we find the trellis on either side planted with Roses and Honeysuckles in great variety—the tree Lupin, Heliotrope, Jessamine, and many other sweet-smelling flowers, all combining to present a beautiful sight to look upon. In the borders also were Roses, Violas, Lilies, Mignonette, Sweet Peas, and a host of other bright and beautiful flowers.—T.

The Tree Lupin.—This shrub was in beautiful flower and most attractive in the gardens of Lord Hillingdon at Hillingdon Court on the occasion of a visit paid a short time ago. Among an excellent collection of hardy trees and shrubs in bloom at the time in this garden none were more interesting than this plant. It stood at the corner of a long walk in the kitchen garden, about 6 feet high, the same in diameter, and presented a rich mass of golden flowers which attracted attention from a long distance. On closer approach we found it to be sweetly scented. The plant had assumed quite a shrub or tree-like appearance. It is of quick and easy growth, as it had attained to this size from seed in some three years. It is hardy in the southern counties, but doubt was expressed as to its standing the winter without protection in the north. The plant grown and flowered as we saw it is a valuable subject for the shrubbery and herbaceous borders in June.—T. E.

Seedling Carnations in July.—I never remember to have seen so many really fine blooms as this season, and such a small percentage of single ones. Although one expects a certain amount, the single varieties this season from Mr. Douglas' strain have not averaged 5 per cent., a good portion are beautiful yellows and selfs, and the flowers are free from splitting, and of splendid texture. For cutting or decorative work seedling Carnations follow the plants grown under glass and bear quantities of flowers; indeed, their greatest fault, if this be a fault, is that they produce too many flowers. They well repay thinning, though I have never practised this, but it would be a gain, as there is an immense strain on the plants in dry seasons if the soil is light. We plant early in August, and give fresh soil if possible, as the land soon tires of Carnations, at least quickly gets infested with its enemies. I am always careful to give the weaker looking seedlings more care, as these usually turn out the best. The soil pays for deep culture and ample food, and the plants never fail if they make a good growth by the late autumn. In our light soil we find it best to add heavy material and to make the seedlings firm at planting time. Mr. Douglas has certainly made great strides with this popular flower, as at the present moment we could select dozens of good show flowers of all shades of colour, and what makes many of them

so much more valuable is their freedom from splitting. Some of the new shades of colour are so distinct that it is difficult to describe them. To show, however, the great variety of colours and shades I have sent the editor a few gathered at random from a quarter containing 1,000 plants put out the last week in July, 1902. Single varieties are sometimes objected to, but in my own case I have found them most useful for room decoration. The colours are kept separate, and when *Gypsophila elegans* is mixed with them they are much liked on the dinner table. They have also other advantages, as the seedling Carnations give so much more "grass" than the doubles, and the foliage is useful for mixing with named sorts. There are few cut flowers that last so well in hot rooms as the Carnations, and this should not be lost sight of. I consider them invaluable to those who require plenty of choice flowers in July and August, and grown from seed sown early the previous year they give so much cutting material, and for bedding should not be overlooked, as few herbaceous plants give more pleasure, and the great diversity of colour always makes them interesting.—G. WITHER.

KENTISH FLOWER SHOWS.

STRANGE though it may seem, the fair gardening county of Kent cannot boast of a single great flower show. Though it enjoys a favourable climate, is famous for its fruit, and is studded with pretentious garden establishments, no horticultural exhibition is held within the borders of the Hop county that can compare in size and excellence with those which annually take place at Hanley, York, Shrewsbury, and elsewhere. Close proximity to the Metropolis may account for this, or, perhaps, lack of interest, but the fact nevertheless remains, and though attempts have been made to establish good shows in various towns, they seem to end in financial failure.

But if Kent is behindhand in the way of large shows, it is to the front with small ones, for, though I have no statistics to prove it, I do not hesitate to say that the Hop county is ahead of all others in the way of village flower shows, and a word about them does not seem out of place in a journal that lives for the encouragement of horticulture in all its branches.

Kent is not a county of coal mines, iron-works, or great manufacturing industries that cause huge towns to spring up like Mushrooms, but it is a land of old-world villages, and steeped in history and folklore, but comfortable-looking and picturesque, and in these little communities horticulture lives and prospers. From the middle of July to the end of the following month scores of country villages hold their annual shows, which receive no publicity beyond a paragraph in the local newspaper, but where the horticultural enthusiasts of the community compete with each other in friendly contest, and display an enthusiasm that never seems to wane as the years roll by. It has been suggested that there are too many shows in the county, all crowded within the space of a few weeks, and that if a number of villages grouped and held a central exhibition it would be better, but our Kentish villager does not see this. He is too jealous of his society and his show to hand it over to someone else, and prefers to keep it, as something belonging to himself, in his own place, and therefore on the same day every year the marquee appears in the corner of the same field, and the same competitors fight the old friendly battle over again.

It speaks volumes for the quiet horticultural

spirit that moves amongst the workers in the county to visit a Kentish village on flower show day. It is characteristic of the people that they do not go into raptures of excitement, for they take their pleasures quietly, almost methodically, yet the flower show is a red-letter day of the year, and the villagers support it loyally by their presence. And the spread of village horticulture has been the means of unearthing horticultural talent of no commonplace order, and almost every society has its champions, who are leading lights of the local gardening fraternity, and prove by the way they manage their gardens and allotments and the excellent produce they stage at the annual show that they are gardeners of Nature's own making, in spite of the fact that scores of them possess hands made horny with hard labour, wear corduroys, and never earn more than 18s. a week in their lives. Few of the village societies can boast of much wealth, many of them have a struggle to keep going, and some are practically self-supporting. In many cases the payment of prizes is dependent on the gate, and I could give instances in which the disaster of a wet day has brought financial failure, and the exhibitors got nothing for their trouble, but it did not dishearten them. To let the society go under is a thing that rarely happens, and the next year the show was held as if nothing in the shape of a disaster had taken place.

A commendable feature about the typical Kentish gardening society is that it is a society in something more than name. It does not consist of an annual show and nothing more till the next season, but throughout the year periodical meetings are held, fortnightly or monthly, at which the members exhibit produce in season, and points are awarded, which represent a certain monetary value at the end of the year, dependent on the funds of the society. You may talk of the gardening spirit which fires this or that individual who makes his mark in horticulture, but it is displayed just as clearly in the Kentish farm labourer, who will drive a plough all day long and in the evening contentedly trudge two or three miles, with a heavy bundle of vegetables on his back and a favourite window plant under his arm, to attend the gardeners' meeting held in the club-room of the village inn.

Naturally vegetables occupy the leading place at the village show, and the splendid produce staged by cottagers affords evidence of the fact that sound practice and honest work play a greater part than mere theory in successful horticulture. Thanks largely to the efforts of influential persons who interest themselves in village gardening, a considerable interest has been awakened in flowers of late years, and, though our cottager has a good deal to learn yet in the art of decorative display, he proves himself to be a cultivator as well as a true lover of flowers, as is proved by the brightness of window and flower gardens, which any traveller through this fair county may see for himself, if he does not follow the latest craze and rush through it on a motor-car at 25 miles an hour.

If I were asked what gardening societies and local shows have done for village horticulture in the county, I should answer by inviting the questioner to walk through the cottage gardens or group of allotments in a village possessing a society and holding an annual show. He would not necessarily have to be an expert gardener to pick out the plots belonging to the society members, and the general condition of the crops would convince him. Further, the spirit of competition instituted by local societies has led to a greater interest being

taken in varieties, and if the local exhibitor sees something that strikes him as being good, he generally succeeds in getting it, though this may mean a sacrifice in some other direction.

Further, I have reason to know that good cottage gardeners are also good workmen, who are eagerly sought after in these days of scarce and inferior labour, and are respected alike by their employers and the village community at large. If for no other reason than this, village gardening should be encouraged, for the practice of horticulture tends to bring the best side of a man to the front, and develops those sterling qualities which go to make British working men the backbone of the country.

Finally, it is only fair to say that the Education Committee of the Kent County Council has done and is still doing an excellent work in encouraging and improving gardening in rural villages. Lectures are given through the winter, and in the summer competitions are held and prizes awarded for the best cultivated plots. That these privileges are appreciated by members of local gardening societies and others is proved by the keenness displayed by competitors to obtain the requisite points to ensure the winning of a County Council prize. There is a double advantage, for the plot that secures an award cannot fail to be profitable to the cultivator through the varied amount of produce he obtains from it. G. H. H.

THE TULIPAS.

(Continued from page 77.)

T. retroflexa (Hort.) is a well known and valued Tulip of garden origin, fully 2 feet high, with slender, rather lax stems and much-pointed, reflexing, canary-yellow flowers, which are undulating on expansion. The basal colouring is a slightly darker stain. One of the best border Tulips, elegant and graceful always, and really valuable for all kinds of floral decoration. It requires the best cultivation possible, as its constitution is not so strong as many; but with quite three months' ripening in an airy shed, and a semi-shaded site in which to grow, it cannot fail to thrive. It should be isolated from new introductions, especially those obtained from Southern Europe, for it is very susceptible to fungoid diseases hailing from the South.

T. saxatilis (Sieber), a charming, free-flowering species, with broad, glossy green leaves, which make their growth throughout the winter. The flowers are borne on branched stems, generally in threes, and they are coloured a pleasing shade of rosy pink, with a well defined clear yellow base. The flowers have the pretty shade of *Lilium rubellum*; they span 4 inches across, and are produced quite early in the year. The plant comes from Crete, and it is quite hardy here, though its leaves are often disfigured by wintry storms. It likes a root-run of *detritus* of rock on a warm rockery slope or warm border, and its bulbs are of that brick-red coloured type that invariably need a good summer's baking to ripen thoroughly.

T. Sprengeri.—A very late-flowering plant with the habit of *T. sylvestris*. The flowers are cone-shaped, much pointed, coloured bright scarlet, flushed with grey externally, and the basal colouring is dark brown or black. The flowers span 5 inches, and open during bright sunshine only. Generally the last to flower. Treatment of *T. Hageri* var. *nitens*.

T. stellata.—A charming little plant from Kashmir, which much resembles the European *T. clusiana* in form and habit. It is a miniature species with slender leaves and Buttercup-

yellow flowers, the petals of which are boat-shaped, pointed, each 1½ inches long, flushed on the outside with rosy carmine. It expands fully during bright sunshine, and it is then very pretty indeed, the flowers being distinctly star-like—a feature that suggested its name. It has no basal colouring whatever, and the petals glisten as though highly polished. It flowers in April. Treatment of *T. clusiana*.

T. stragulata (Reboul).—A European plant of gesneriana type, the flowers of which are cone-shaped, 2½ inches long, coloured a beautiful chrome yellow, pale primrose near the margins, and flushed with rose externally. The base is coloured black.

Var. *primulina* has a sulphur-coloured flower.

Var. *picta* is a rich yellow-coloured form spangled with rose externally, and flushed with orange red near the mid-rib. Capital garden plants, but little grown, yet worth every care. Their colouring is choice and delicate, their shape pleasing, and their garden value great. Quite ordinary treatment suits them.

T. suaveolens (Roth).—A lovely Tulip, and a rarity from the Crimea. Flowers scarlet, of exceptional richness, and very fragrant, resembling the new *T. præstans* from Bokhara very closely, in so much that I think it possible to find a close relationship between them. *T. suaveolens* appears to differ from that plant in its darker scarlet colouring, in being mainly one-flowered and in its richer fragrance. The leafage of the two plants is identical. April; treatment of *T. præstans*.

T. sylvestris (L.) is a charming native species widely spread throughout Europe, generally found in association with woodland and scrub, but quite as well adapted for border cultivation as for specialised shady sites. It has small bulbs, channelled, erect leaves, and nodding stems. The flowers are cone-shaped, much pointed, coloured a clear yellow, and flushed with green externally. They average 3 inches in diameter. The bulbs are stoloniferous, and in many cases where the plant is successfully naturalised it fails to flower well mainly because it forms too dense a patch to enable individual bulbs to develop strength. There are numbers of geographical forms, mainly better as garden plants than the type, the flowers being larger, and their robust strength is a factor in establishing their garden worth.

Var. *florientina* is a giant form, with large flowers, 6 inches in diameter, very fragrant, and a good garden plant. One of the best Tulips for free and unrestrained use in semi-wild gardens. It grows fully 2 feet high in a good soil.

Var. *italica* has shorter, more rigid stems, about 1 foot high, and the flowers of *florientina*.

Var. *fragrans* is the Algerian form, a great Rambler and markedly fragrant. It is often called *odorata*, a name employed loosely for all the forms of *T. sylvestris*. *T. sylvestris* and its varieties seem peculiarly fitted to hold their own with other plants in a semi-wild state. Their stoloniferous bulbs assure for the plant a fresh site every year without the aid of the planter, and, provided they do not become too crowded and starved, they will take care of themselves in all but the strongest grass land. Moreover, in establishing *T. sylvestris* in woodland one is not offending the laws of Nature, merely returning a woodland plant to its native and best environment.

T. triphylla (Regel) is a variable Turkestan species, the leaves of which are small, channelled, ascending, the bulbs small, the stems under a foot high, and the flowers are shaped like those of *T. kolpakowskyana*, petals broad and pointed, reflexing on expansion, of pretty

shape when closed, coloured an orange or lemon yellow with no basal marking; the exterior is flushed with olive green or bronze. It is a very pretty plant, charming in its colour variations, its neat habit and pointed buds. The flowers span quite 4 inches, and they are as showy as they are choice. It requires a rockery on which to grow, and, like all its fellow countrymen, needs a good ripening season. April.

T. undulatifolia (Boissier).—An Asia Minor species of small stature, with slender undulating leaves and stems; flowers bright purple-red, cone-shaped, greyish externally, the petals of which are thin and much pointed, the inner broadest, and keeled with grey. The basal colouring is a large black disc. Culture as for the last species. April.

T. violacea (Boissier and Buhse) is a Persian plant closely allied to *T. Lownei* and *T. pulchella*. Leaves slender, stems lax and nodding, 4 inches to 6 inches high. Flowers reddish purple or dull carmine, the petals of which are narrow and boat-shaped, flushed grey externally, and coloured rich blue inside near the base. Culture as for *T. clusiana*. April.

T. viridiflora (Hort.) is a Tulip of garden origin, admired by one half the world and detested by the other half. It grows a foot high, stems rigid, flowers olive green, tinted yellow near the margins, and flushed greyish externally. The petal tips are much pointed, and their margins are always undulating and often deeply cut. As a garden plant it is inferior to its variety *præcox*, but its semi-wild aspect and singular colouring will, doubtless, continue to please. Very easy to grow. May.

Var. *præcox* is a taller plant, seen at its best in the latter part of April. The petals are very broad near the tips, undulating, reflexing, coloured emerald green, shading to a paler margin when it first opens, but changing to a pale silvery cream tint with age. There is no basal blotch. The surfaces of the petals are very lustrous. The flower is well shaped and the best of its group. Despite the ease with which it may be grown it is becoming scarcer every year, owing to the excess of demand over supply. One can describe it as a pretty and very interesting plant, the colours of which are refined, and the petals are remarkable for their good finish.

Var. *tardiva* is a late flowering form of the type, coloured a dull, uninteresting green. Of little garden value, and quite unornamental. It is grown only as a curiosity.

T. vitellina (Hortus) represents the highest standard of excellence found in old-time Tulips. It grows 18 inches high. The flowers are elegantly shaped, quite 6 inches across, the petals of which are pointed and reflexing, the inner rounded and longest. Colour, a delightful shade of chrome, flushed with olive externally, showing a distinct olive shade throughout when the flowers first open, but changing to a pale chrome yellow with age. There is no basal marking whatever. A lovely Tulip, and deservedly popular. A slightly shaded site brings out its best qualities. May.

T. wilsoniana is a new species from the East, 8 inches high as an average, the leaves of which are slender, the flowers brilliant blood-red, 2 inches to 3 inches long, cone-shaped, without any basal colouring whatever. It is a choice little plant, requiring a very warm position on a rockery as its hardihood is not a matter of certainty. April.

There are several other species recorded by botanists purposely omitted here, either on account of extreme cultural disability or because they are quite unknown to horticulture. Many garden varieties also bearing

popular or vernacular names, though obviously varieties of species herein included, are better and more rightly included in the following essay on "Garden Tulips."

(To be continued.)

NOTES FROM SWANSWICK.

SHRUBBY VERONICAS

It is a thousand pities that these are not hardy everywhere, for they really possess every possible advantage as decorative garden shrubs. They grow more or less quickly—some of the most beautiful very quickly indeed—they are evergreen, they have beautiful glossy leaves, and, lastly, most

about here, is much sold in pots for window boxes, &c., and may be seen outside greengrocers' shops in quantity, is much less attractive in flower than the rest I have, but is useful, because it grows so neatly, always making a round bush that develops equally all over. It appears perfectly hardy, and will accept anything offered in the way of soil, and when covered all over, in July, with its small white flowers, is pretty, if not exceedingly showy. It might very well be planted where one now sees those low Privet hedges, of surpassing ugliness and lack of interest, that people put along the tops of retaining walls, &c., in their town front gardens. Of the small non-shrubby Veronicas, I think *V. saxatilis* is of the prettiest. Its blossoms, which are large and solitary, studded along the tufted stems, are of a true gentian blue, shaded in the centre with violet, and make a delicious bit of

names; a very bright violet-blue one, creeping, and a most encroaching spreader, is, I think, *V. Teuorium*, a lovely mass of colour, and like a weed for ready growth in any position. *V. verbenacea*, a very neat little plant of the smallest dimensions, is the latest acquisition, but has not yet flowered, while the handsome *V. amethystina* is doing well on a rather arid hot bank, where the only other perfectly happy plant is *Plumbago Larpentæ*. *Malvastrum Gilliesii* has just flowered for the first time here. The blossom, about an inch across, and shaped like an *Erodium* flower, is deep pink, with a black centre, decidedly pretty. At present the plant, growing on a sunny (and extremely hot) bank, with its roots packed away from all possibility of heat or drought between horizontal stones, is small, but it seems healthy and increasing. It is quite a dwarf, and apparently fit only for the

PERGOLA IN A FLOODED GARDEN IN JUNE.

ornamental flowers of every shade—from deep blue-purple to pale lilac, and from red-crimson to flesh pink. Of all the red varieties I have, or have seen, T. Smith's Diamant is the finest, both in colour and massive size, of the large crimson spike—*real* crimson, not the dark violet of florists—but this is, with me, one of the slower growers. Its leaves are wide and substantial, and, truth to tell, a trifle more tender in frost than some, but it is a glorious thing. I have about ten varieties, including a very pretty one, with a spike shaded from deep to pale rosy pink, and an exact counterpart to it in blue; these, with one that has a spike where each individual flower, of a very bright lilac-blue, is large, solid, and open, thus giving a quite different effect to the more feathery one of the small clustered blooms, were gifts from that splendid garden at Dawlish where the Veronicas grow into giants, and have an ideal home. *Veronica Traversii*, which,

jewel colour on the sunny rockery. It is very neat and dwarf, a solid little plant that increases steadily by throwing out roots on the under side of the stems, but is not at all rampant. It likes a top-dressing after flowering, and seems to do well almost anywhere. Of *Veronica spicata* I am less fond. It is pretty in the mass, but each thin spike, with its tiny flowerets, is individually so poor. However, as it is supposed to be miffy in some gardens, it is sure to be a favourite on that account, since growing it well does the grower some credit. *Veronica pectinata rosea*, lately sent as a gift from the North of England, is doing extremely well, and is interesting from its unlikeness to other members of the family. It has whitish or silvery tomentose leaves, is quite prostrate and creeping, and has pretty, small, solitary, rosy-pink flowers. There are also in the borders and on edgings two or three others of which I have not the right

choice rockery, where nothing will rampage and choke it. *Cyananthus lobatus* is doing well close by under the same conditions, but, of course, will not flower just yet.

(To be continued.)

THE FLOWER GARDEN.

A GARDEN IN FLOOD-TIME.

SEND the enclosed photographs thinking that perhaps the readers of THE GARDEN might be interested to see how picturesque a "Garden by the Waterside" may look even under very adverse conditions. The flood last June was quite unprecedented in the Thames Valley, and distressing in many ways; but there was so

much of beauty in the reflected colours of the flowers, so many brilliant effects of sun and shade among the trees, that one came almost to wish it permanently in very truth "A Water Garden." How the Roses have flourished since! Never has Papa Gontier held up on sturdy stem such wealth of perfect buds, never has Mme. Lambard given so generous a display of tender pink and yellow flowers, but alas! there has been sad havoc among the Iris germanica, Oriental Poppies, Dianthus, and other perennials, so much havoc, indeed, has led the gardener to class June floods among "all the other things which we has to content with."

Bourne End.

C. C. B.

DODECATHEONS.

(AMERICAN COWSLIPS.)

THE Dodecatheons, American Cowslips, or Shooting Stars, as they are variously called, are singular looking, but very interesting garden plants that anyone can grow. There are about eight species, and numerous geographical forms that do not materially differ in size, shape, form, or colouring, being mere gradations of white, lilac, rose, and crimson. They are natives of California, Oregon, and Western America generally, and though they inhabit a large

like those of all the Primulaceæ, are slow to germinate, or by offsets, which are freely produced by removing entire roots in early spring, pulled clean from the root disc. These have small buds at the junction with the crown, and if stratified in damp sand in some shady corner and kept well watered they make quite respectable plants within a year of severance and will flower in the second growing season. April, May, and June are the flowering months, beginning with *Hendersoni* and *Clevelandi*, and ending with forms of *Meadia*. Slugs do some mischief by eating the tips as they start into growth, but a handful of sharp sand placed over each crown as it emerges will effectually prevent this. Hybrid forms of *D. Meadia* now available for general planting are great improvements on existing species, and their usefulness is so great that one hopes for still better things to come, in which the yellow shades of the small *D. patulum* may be employed to give colour variation.

D. Clevelandi (Greene), a native of California, is a slender-growing plant; the leaves are narrowly ovate, in a lax rosette of ten, and the stems are purplish, under a foot high and bear from six to twelve flowers in various shades of pink; the petals are three-quarters of an inch long and slightly twisted, as in Cyclamen, marked with a ring of crimson-maroon around the anthers. White forms are

and with thirty to forty flowers in the umbel.

D. Hendersoni (Asa Gray) is an Oregon species of slender habit; the leaves are broadly lanceolate and arranged in a lax rosette. The stems are purplish, 8 inches to 12 inches high, and bear a dozen deep rosy-tinted flowers of pretty shape, tinted paler at the petal tips, and zoned with white, yellow, and mahogany concentric rings around the bunch of anthers. A pretty species and one of the earliest to flower. It reaches its best stage in a damp, cool spring, and it requires protection from drying winds, the leaves being of thin texture and seemingly incapable of withstanding drought.

D. Jeffreyi (Moore) = *D. Meadia* var. *lanceifolium* (Asa Gray) is a vigorous plant, and, as already mentioned, is suitable for waterside and marshy places. The leaves are long, arranged in a dense rosette of twenty or more, often nearly 2 feet across. The stems are strong, purplish, above a foot high, and bear six to ten flowers on long pendent pedicels. The petals are very stout, rosy-pink marked white at the base, and with a yellow ring at the throat. It will grow in any good garden soil, but is at its best by the waterside. There it makes a thick mat of roots, stout leaves, and many stems 2 feet high, bearing large and singularly graceful flowers, but the umbel never has the imposing appearance of the *Meadia* forms, as but few flowers are produced at a time.

D. Meadia (L.) is an old garden plant, and the one commonly found in American pastures. It has ovate leaves in a lax rosette, and greenish stems, which support a close umbel of six to twenty pale rosy lilac flowers. The petals are three-quarters of an inch long, white at the base, and zoned with carmine to form a ring around the yellow, carmine-tipped anthers. As a garden plant it grows 1 foot to 2 feet high, but it is very variable as regards size, ranging from high mountain forms a few inches high to stately plants 2 feet high from marshy plains, and these mountain forms do not reach the stature of the low-level plants under cultivation.

Var. album is the white form of the type. It is comparatively slender in growth, but it flowers freely.

Var. elegans is a pretty plant, with slender stems 1 foot high, bearing rosy-lilac flowers "shot" with tints of violet. The plants make rapid increase, as the roots are naturally brittle, and the slightest disturbance of the crown during winter severs every one, and each forms an independent plant. It is on this account that old-established plants are rarely seen, the plant being generally represented as a colony of youngsters, and if one wishes to separate such colonies it is necessary that the site should be dried by placing a light over it till the roots are slightly withered. They are then more pliant, and can be separated without becoming detached from the plants.

Var. splendens is a form of the latter with deep crimson flowers. I do not know if it is found as a wildling, but seedlings of *elegans* often resemble *splendens* and *vice versa*. *D. integrifolia* (Hort.), with deep crimson flowers, cannot be differentiated from this plant. All three lose their roots wholesale when disturbed unless prevented by drying somewhat as described.

D. patulum.—A Californian plant, is very interesting, and lemon-yellow in colour. It grows 6 inches high, has lanceolate leaves in a lax rosette 8 inches across, and bears six flowers on each stem. It should be grown

A THAMES GARDEN FLOODED IN JUNY. (Note the water by margin of mixed border.)

area and undergo varied conditions of climate in a wild state, all may be grown side by side in any damp, cool situation. They prefer a root-run of peat, leaf-soil, and sand, and, where available in quantity, the gritty sweepings of country roadsides, stacked to kill weeds and their seeds, will form capital rooting material without further addition.

The site selected should be slightly shaded, but such places as the foot of a rock garden where Ferns will grow suits them well. *D. Jeffreyi* is a capital marsh plant. It is vigorous, and so cheap that it may be planted in quantity among Primulas and similar plants by waterside, and if given plenty of room to increase it will naturalise itself in such places.

Propagation may be effected by seeds, which,

often found in a wild state, and their stature is generally smaller than that of the type. *D. Clevelandi* as cultivated in England is a poor plant compared with specimens found growing wild in California. Our climate is probably too varied for its well being.

D. ellipticum (Nutt) = *D. brevifolium* (Asa Gray) is another Californian plant, the leaves of which are as broad as those of Violets, arranged in a dense rosette of twenty or more. The stems are often 2 feet high, and bear a large umbel of pale lilac flowers, which, on account of the short pedicels, appear too closely packed together. They resemble those of *D. Meadia* closely, and are similarly marked at the base. A sturdy plant of vigorous growth, often 12 inches across the rosette of leaves,

with the cooler alpine, and would succeed better in a roomy pan in the alpine house than among stronger plants in the border. Numerous forms are known, of which *alba*, white, with yellow ring, and *Beauty*, its pink-tinted form, are good.

HYBRID DODECATHEONS.

These are a distinct gain. They are vigorous, and have broad, firm petals, while the lilac tint that mars the colouring of many species is absent. A few that have been brought under my notice have not been real breaks, and these are omitted from the appended selection.

D. Clarinde has lanceolate leaves and slender stems, bearing umbels of forty flowers 1 inch long, coloured white, tinted pink at the tips, and stained at the base as in *D. Meadia*. The pedicels are long, giving the umbel a loose and elegant shape, while the petals have the half-twist characteristic of *Cyclamen persicum*.

D. Gladstone.—Stems and leaves as in *Clarinde*. Flowers white, three-quarters of an inch long, petals as broad as they are long, overlapping, crimped at the free tips, and tinted purple. There are forty flowers to the umbel.

D. La Grandesse.—Leaves broadly lanceolate, very strong; stems 18 inches high, bearing an umbel of thirty flowers, the petals of which are white, flaked and slightly tinted pink at the tips. Size and shape of *D. Meadia*.

D. Mme. Blanche.—A very vigorous plant and a real triumph of the hybridist's art. Leaves and stems as in *Jeffreyi*, but larger. Flowers fifty to the umbel, borne on long pedicels, coloured pure white, the petals of which are very thick, wedge-shaped, above an inch long and three-quarters of an inch broad at the tips. A very free-flowering plant of easy culture, and the best *Dodecatheon* I have seen.

D. Rose Queen.—Strong plant, 1 foot high. Leaves broadly lanceolate, short. Flowers thirty to the umbel, soft rosy tinted, the petals of which are twisted as in *Cyclamen persicum*, showing the paler coloured reverse.

D. Vondel.—A very strong, richly-coloured, many-flowered *D. Meadia*; petals slightly twisted, showing a flesh pink reverse, and with crimped margins.

The above list must not be accepted as complete, for there may be others equally good that I have not seen, or which are not available in sufficient quantity to warrant notice.

GEO. B. MALLETT.

STREPTOCARPUSES IN THE FLOWER GARDEN.

LAST year, anxious to provide for the welfare of some ordinary pale grey *Streptocarpus*, the result of a much-praised packet of seeds which had as seedlings all assumed this pallid, modest hue where various brilliant flowers had been expected, it was suggested that before throwing the plants away they should be tried in the flower garden. In default of testimony to their hardiness only a few were made pioneers in this (here at least) new departure. The result was satisfactory in every case where the plants enjoyed half shade and moisture at the roots. When autumn came these, with other half-hardy bedding plants, were potted up and wintered in a cool greenhouse. This year the whole batch of these grey *Streptocarpus* have been transferred to the borders since the beginning of June, and have attracted much notice by their soft and vigorous foliage and long, *Gloxinia*-like blossom. They would be charming as edging to beds of brilliant *Fuchsias* or bright-flowered *Abutilons*; indeed, the Cape Primrose is worthy of a border to itself, and would be no doubt more effective should the brighter-tinted hybrid *Streptocarpus* of more recent introduction prove as hardy as their congeners.

SUFFOLKIAN.

TREES AND SHRUBS.

THE NEW ABIES CONCOLOR ARGENTEA.

I HAVE pleasure in sending you a branch of the new *Abies concolor argentea* (Wattez), which was sent out a few years ago. It did not meet with the general approval which such a first-class novelty deserves, most likely because it is not often seen at its best, also its hardiness is suspected, and it is difficult to grow into nice well shaped plants. As to its hardiness it has stood here, only sheltered from the severe wind, unprotected, without suffering in a frost of 34° Fahr. The way to propagate it is by grafting on the Silver Fir, and it takes some years to get a good plant; still, it is far more easily grown than concolor violacea, for it is astonishing the number of leaders on one plant. The colour is pure golden in May, this turning to a beautiful silver as the shoots mature; the colour is quite new amongst *Abies*, and I am confident when better known that it will be a rival to *Picea pungens glauca* in not too rough and exposed positions.—A. M. C. VAN DER ELST (Manager of the Tottenham Nurseries, Limited), *Dedemsvaart, Netherlands*.

[This is a most interesting and distinct *Abies*. Where conifers thrive, the typical *A. concolor* and its well known variety *violacea* make exceptionally handsome trees, and as the new variety appears to grow well it should do the same. At Kew a specimen of this variety has been in cultivation for about two years. It is now about 4½ feet high, and is of fairly symmetrical habit. The leaves are from 1 inch to 1½ inches long, and hardly so wide as those of the type. In colour they are of a yellow shade when first developed, changing to a silvery hue with age. Along the centre of the leaves on the upper side a pale green mark is to be seen, while on the under surface the same mark is to be found, but of a much deeper green. The colouring of the leaves gives the plant a delicate appearance, and this has caused some people to doubt its hardiness. Mr. A. M. C. van der Elst, however, vouches for its hardiness, and says that it has stood 34° Fahr. of frost without injury in their nurseries, the plants having a position sheltered from cold winds. In places where conifers do not thrive well it would be folly to plant this novelty, but in gardens where conifers are a success it should find a place.—ED.]

SPIRÆA LINDLEYANA.

THE beauty of this plant has been alluded to so many times in THE GARDEN that it seems almost unnecessary to refer to it again. The attention of intending planters, however, cannot be too strongly directed to it, as during the latter part of July and most of August it forms one of the prettiest shrubs in flower at that time. It is a great mistake to put single plants of it in a shrubbery, as I have often seen it, where it is either smothered up with other things or starved in the shade of big trees. Its proper place is on a bank by the side of water, where, if planted in a large clump, it forms a pleasing sight when covered with its large, terminal panicles of pure white flowers. Full exposure to the sun, and a light, but not too dry, soil result in vigorous, healthy plants 8 feet to 10 feet high, which require little attention when they are once established. A thinning out of the weakly shoots during spring or early summer is beneficial, as it increases the vigour of the remainder,

and lets light and air to the centre of the plant. *S. lindleyana* is worth growing for the sake of its foliage alone, the leaves being pinnate, and consisting of about eighteen to twenty narrow, deeply serrated leaflets of a pleasing soft green colour. It is easily propagated by the suckers it throws up. These can be detached in the winter with a portion of root, cut down to half their length, and planted. In two years they will attain flowering size.

HYDRANGEA PANICULATA GRANDIFLORA.

THIS well repays close attention, as when well grown it bears immense panicles of flowers upwards of 18 inches in length, and of a fine pyramidal shape. To grow it well the plants should be cut

ROSA SINICA IN THE GARDEN OF THE HOTEL CALIFORNIE, CANNES.

back to within two or three eyes of the old wood each spring, and the resulting shoots thinned out to from two to six, according to the size of the plants. Those that are left should be tied to stakes as they grow, and when the flower-buds appear the plants should have one or two soakings with liquid manure, and a mulching at the same time is also beneficial. The showiest of the flowers are the flat, sterile ones, the fertile blooms being small and insignificant, and are to be found half hidden by the others. The spikes last for a considerable time at their best, and then gradually go off with a pinkish tinge before finally dying. This plant is sometimes grown as a standard by training a single stem to the desired height, but this form of growth is not suitable, as the flower-stems are too heavy to stand erect without support, especially during heavy rains.

Bagshot, Surrey.

J. CLARK.

ROSA SINICA.

THE accompanying illustration, reproduced from a photograph kindly sent by the Rev. A. Carter, Thrussington Vicarage, Leicester,

represents a plant growing in the garden of the Hotel Californie at Cannes. It is interesting because it shows how well this Rose succeeds in the South of France, where also that lovely hybrid *R. sinica* Anemone flowers with a freedom unknown in these isles. Few single Roses are more beautiful than Anemone with its large, tender, rose flowers and bunch of yellow stamens.

NOTES ON HARDY PLANTS.

THE JAPANESE IRIS.

I. LEVIGATA (KEMPFER).

AS there seems to be some doubt regarding the proper way of growing these magnificent Irises, our experience here may be of use to other Midland county gardeners. We started with three lots from English nurserymen and planted them (1) by the riverside; (2) 15 feet from the river in a border made for them; (3) in the herbaceous border in the garden. The soil is heavy clayey loam. No. 1 flowered the first season and died during the following floods; No. 2 have never flowered and are dying; No. 3 flowered the first year well, the second year badly, and the third year not at all. They look healthy.

Last year we bought some and planted them in rich black kitchen garden loam in a bed 12 feet wide, under a wall sheltering them from the sun after twelve o'clock. They flowered well the first year. During the winter they were mulched with fibrous turves, and on coming into flower this year they were well watered every day with manure water. They have flowered really well, and have produced flowers 7½ inches across. We tried manuring another lot in winter with rich farmyard manure as they do in Japan. Those plants died. Ours here were very nearly as fine this year (though not quite) as the Newstead Abbey beds which I saw last year. They are planted by the hundred in a meadow in ridges like Potatoes, kept as dry as possible during the winter, and irrigated by turning a stream on to them during the summer. That is the proper way of growing them.

Wychnor.

BASIL LEVETT.

CAMPANULA PYRAMIDALIS FROM SELF-SOWN SEED.

THE illustration shows a plant of this noble Bellflower from a self-sown seed in a chink of a rough wall. This will interest those who only know the plant in the border or in a pot in the greenhouse. It is a wall plant of great beauty, and, as our illustration shows, succeeds as well there as in a border.

ROUND ABOUT A GARDEN.

FLOWERS FOR BUTTERFLIES.

I SYMPATHISE with the motive which no doubt actuated the question of a correspondent as to which of our late summer flowers are most attractive to Red Admiral butterflies. I doubt whether any flower can be as beautiful as this gorgeous creature, with its broad wings of black velvet splashed with white and barred with scarlet. Equally

splendid, and in some gardens more common than the Red Admiral, is the Peacock, with damask wings, each carrying in its corner an eye of many wondrous hues. Then there is the large Tortoiseshell, as grand a

black, and its delicate marginal embroidery of brightest blue.

USEFUL AND BEAUTIFUL.

It so happens, moreover, that three of these four winged jewels feed in the caterpillar stage upon the common Nettle; so that by encouraging them you are conferring a benefit on the vicinity. Indeed, with the exception of the "cabbage white" pests of the kitchen garden, it may be said of British butterflies in general that none of them does any appreciable harm in a garden or anywhere else; while, besides the Red Admiral, Peacock, and small Tortoiseshell, which help to keep down the Nettles, another very beautiful butterfly, the Painted Lady—unfairly so named, seeing that its colouring owes its charm to very modest harmonies of pinks, and greys, and buffs, relieved at the corner tips with a contrast of black and white—is also useful from the war which its caterpillars wage upon Thistles.

WINGED GEMS AND RARITIES.

There are many other pretty butterflies, too, coppers and blues, brimstones and orangetips, tawny fritillaries—leopard-spotted and tiger-striped above and spangled with silver below—commas with curiously jagged outlines, and delicately pencilled hairstreaks, which will all come in their seasons to a wisely-planted "butterfly corner" in any well-placed garden. In some districts a garden may even tempt that grandest of British butterflies, the Swallowtail, from its home in neighbouring Fenland; and it is especially in gardens that are haunted by Red Admirals in autumn that you may have a chance of watching that splendid rarity, the Camberwell Beauty, sunning its great wings of crimson-damask, margined wide with creamy white and embroidered with blue, upon some cluster of attractive blooms. As, moreover, these flower-haunting butterflies have strong homing instincts and return to the same feeding places day after day, it would not be impossible with good luck, to retain your rare guest about the place until the time should come for it to seek winter quarters. Perhaps even in spring it might reappear with the faded Peacocks and tattered Red Admirals that sun their old wings on the gravel paths and sunlit walls, and establish from its eggs a local race of this extremely rare and handsome butterfly.

CURIOUS TASTES.

One needs not, however, to meet with such remarkable results from the establishment of a "butterfly corner" in one's garden to gain from it more than enough pleasure to compensate for the trouble and the small loss of garden beauty that the scheme entails. The latter is inevitable, for there is nothing in the behaviour of butterflies in a garden to support the popular scientific theory that we owe the bright colours and dainty markings of flowers to the aesthetic tastes of honey-seeking insects. To a Red Admiral the appearance of a flower seems to make no difference. Provided that it offers "sweets" to his taste, he will as readily resort to a rotten Pear, or to the sugary mixture spread by entomologists on the trunks of trees, as to any flower. Indeed, if your attention happens to be drawn in autumn to the dark stain on a tree trunk caused by the ill-smelling slime that exudes through the bark when goat-moth caterpillars are devouring the

CAMPANULA PYRAMIDALIS (7 FEET HIGH) SELF-SOWN IN WALL.

butterfly as either of these, but more richly subdued in colouring, with variant shades of tawny, brown, and black, and faint azure lunules round the margins of its wings. Even the common small Tortoiseshell is a gem, with its bright contrasts of yellow, orange, and

inner wood, you may often see Red Admirals greatly disputing with hornets and wasps for the liquor. Nay, it was at such a strange feast that I discovered as a boy the first Camberwell Beauty that I had the good luck to see. So long, however, as your "butterfly corner" contains the right kinds of flowers, you need not fear that the butterflies will desert it for these "dainties."

THE BEST "BUTTERFLY FLOWERS."

Of all flowers known to me, that which the Red Admirals, Peacocks, and Tortoiseshells seem to like best is Peppermint; but as you cannot have this untidy herb spreading all

and creeping thing that feeds on honey, and in mild weather during autumn, whether you visit the Ivy by day or by night, you will always find a wondrous company of insect guests assembled.

FROM SPRING TO AUTUMN.

In spring the same butterflies that gathered for their last meal on the Ivy bloom may meet again where wild Hyacinths grow in plenty; and I have seen natural beds of these flowers whose blue haze seemed from a little distance to be sprinkled with large purple and bright

AN ARTIST'S NOTE-BOOK.

A NEW BEGONIA FOR BASKETS.

BEGONIA MARIE BOUCHETT should be taken note of by those who wish for a good basket plant. It was exhibited at a meeting of the Royal Horticultural Society recently. Many of the trailing shoots were quite 4 feet long, and the plant was 3 feet or more across. The flowers are scarlet and quite double, but not the doubling we are

BEGONIA MARIE BOUCHETT.

(Shown by Mr. W. Greenwell, Malden Park, Woldingham (gardener, Mr. W. Lintott), at a meeting of the Royal Horticultural Society on July 21, and given an award of merit.)

over the place, it is fortunate that a trio of popular garden flowers run the Peppermint close. These are Scabious, Sedum spectabile, and Michaelmas Daisy, of the compact blue varieties especially. The flowers of all kinds of Thistles are very attractive, too, and I do not think that handsome butterflies are seen anywhere to such advantage as when two or three are spreading their wings together on the deep blue blooms of Thistle or Sea Holly. French and African Marigolds are "butterfly flowers" also, as well as Verbena and that old-fashioned flowering herb, the Tansy. Later on, however, your garden will contain nothing to tempt the butterflies from flowering Ivy. In the Ivy bloom Nature provides the year's late supper for every flying

yellow Lilies, from the number of Peacock and Brimstone butterflies that were hanging to the Hyacinth bells. As, moreover, flower-haunting hawk-moths will visit a garden which pleases them at any season of the year, and are almost more interesting from their swift mysterious ways than the butterflies, it is well to remember that wherever there are Petunias and Red Valerian, Jasmine and Honeysuckle, there will be hawk-moths. Among trees, the Lime, Sycamore, and Willow are most attractive to moths; and of shrubs, perhaps the Syringa, Snowberry, Privet, and Laurel. In July, however, almost every honey-seeking insect of your garden will desert it for the Bramble, flowering in the neighbouring hedges. The Sallow in spring, the Bramble in summer, and the Ivy in autumn offer the three great flower feasts of the insect world. E. K. R.

accustomed to see in many of the tuberous varieties. The drawing represents about the natural size of the plant.

USES OF BRITISH PLANTS

VIII.—ROSACEÆ.

SLOE OR BLACKTHORN (*Prunus communis*).—This is the origin of the Bullace (sub. sp. *insititia*), and of the Plum (sub. sp. *domestica*), being common in hedges, &c., all over England. It has spines or abortive branches in the wild state; but these become developed into branches under cultivation, so that Plum trees become spineless. The fruit is too astringent for food, but makes a fair conserve. British port wine has been made with it, and the juice affords a good marking ink. Some sixty years ago the leaves were collected for making "lie" Tea, and advertised as a substitute for Tea leaves. The present writer possesses a sample of it; but as it was employed in adulterating China Tea it was suppressed. The bark of the Sloe, being astringent, has been used as a substitute for cinchona in ague and fever. The wood is particularly strong, so is useful for the teeth of rakes, &c.

The sub-species *Bullace* has globose drupe, black or yellow in colour. It is occasionally wild; but doubtfully so in many places. It extends to North Africa and the Himalaya. It is somewhat austere in flavour, but much less so under cultivation. The second sub-species, the domestic Plum, is only indigenous in West Asia. Plums of many sorts have been grown since the ancient days of Greece and Rome. Thus the Damson is mentioned by Pliny as having been introduced from Damascus into Italy before 100 B.C. The Green Gage came from Chartreuse and was brought there by Claude, the wife of Francis the First, and is still called *Reine Claude*. Prunes are a variety especially cultivated in South France and dried. Plum trees constantly throw up suckers from their roots, by which they might be propagated, but they are generally grafted in order to retain good sorts.

Cherry (*Prunus* sp.).—This fruit is derived from three British species. The wild or Dwarf Cherry (*P. Cerasus*) occurs in many parts of England and is regarded as indigenous. It is the origin of the Morello, Duke, and Kentish Cherries. In the wild state the fruit is small and acid. *Gean* (*P. Avium*) is found in copses and woods; but is probably wild only in the south. It is the origin of the Geans, Hearts, and Bigaroon Cherries. Pliny says of it: "The Cherry did not exist in Italy until the victory of L. Lucullus over Mithridates, in the year of the city 680. He was the first to introduce this tree from Pontus, and now, in the course of 120 years, it has travelled beyond the ocean and arrived even in Britannia." It extends from Europe to the Himalayas, and is called *Ceras* in Persia, so that this word is probably the origin of the name. The wood is very compact, so is useful for cabinet work and for pipes. On the continent a spirit is distilled from the fruit known as *Kirschenwasser*. *Noyau* and *Ratafia* are said to be flavoured with the kernels, which, like the Almond (another species of *Prunus*), develop prussic acid. *Maraschino* is also prepared from a variety of Cherry grown in Dalmatia.

Bird Cherry (*P. Padus*) is the third British species, also occurring in copses and woods. It has racemes and not umbels of flowers. It bears small, black, and bitter fruit, and was used in Scotland to flavour gin and whisky. Birds are fond of the fruit, hence its name. The wood of

this species is very prettily veined, so is used by cabinet-makers, but is rather small, being more useful for the handles of tools.

Meadow Sweet (*Spiraea Ulmaria*).—This familiar herb, frequenting ditches by roadsides and meadows, etc., is also called *Queen of the Meadows*. It was supposed to have medicinal virtues in its fragrant flowers, but without any good reason. It was one of fifty ingredients in a drug called "*Save*," mentioned in Chaucer's "*Knight's Tale*," when after the battle, "eek save they drunken, for they wolde here lymes have." It was called *Medwort* in the fourteenth century.

Dropwort (*Spiraea Filipendula*).—This occurs in dry pastures, as the Chalk Downs of Sussex. It has pinnate leaves and tuberous roots, which have been used as food in times of scarcity on the Continent. In the Middle Ages it was called *Philipendula* and *Fisalidon*, and was supposed useful for the stone. Being hard, it was beaten up with the stony Gromwell fruits and Cherry stones on the principle of "like cures like."

Raspberry (*Rubus Idæus*).—The wild Raspberry takes the place of the Blackberry in the North, as about Perth and even at Buxton in Derbyshire, occurring in woods and hedges. The berries are as pleasant to eat, but smaller than those of the cultivated variety. It is said that the inhabitants of Skye use them for making syrup and spiritous beverages. As also in Poland the juice is simply fermented. Gerarde figures and describes it as *Rubus Idæus*, the *Raspis* bush or *Hindberrie*, but speaks of the fruit as "of taste not very pleasant." It was called *Raspa* in the fourteenth century, and Raspberry wine was then made from it and used as medicine. It derives its name *Idæus* from "*Mount Ida* on which it groweth" (Gerarde). The Raspberry was first transplanted and cultivated in the reign of Edward I. in the thirteenth century.

Blackberry (*R. fruticosus*).—This has numerous sub-species and varieties. Used as a drug in the Middle Ages, it is now one of the very few wild fruits of this country, which is largely collected and sold by the fruiterers.

Cloudberry (*R. Chamæmorus*) is a native of the mountains of Scotland and Ireland. It is quite a dwarf plant, under 12 inches in height. The fruit is of an orange colour, well flavoured, and sometimes made into a preserve; but it is more used in

Scandinavia, where the plant is abundant. It is cooling and delicious fruit eaten with sugar and cream. Vinegar is also made by the fermentation of the fruit. GEORGE HENSLOW.

THE ROCK GARDEN.

ROCK GARDEN - MAKING.

XII.—ROCK BUILDING ON ABRUPTLY SLOPING GROUND.—ROCKS ON A LARGE SCALE.

IN the last chapter I pointed out what I consider the most effective way of dealing with rocks built on abruptly sloping ground. The illustration there given showed a portion of some completed work on rather a small scale. I will now briefly consider the construction of rocks on a larger scale under similar circumstances, i.e., on a slope more or less abrupt, and by way of illustration I have photographed a portion of Mr. P. Singer's rock garden at Pailinton.

If, even in small rock gardens, it is necessary for the sake of picturesque effect to have the rocks not too continuous, but well broken up, this becomes still more important in the case of a rock garden on a large scale. Bold effects in a large rock garden are very necessary. To produce them we must provide a series of absolutely distinct features, which, however, should be so grouped as to be harmonious when seen as a whole. The rocks, for instance, in one place may appear very bold and massive and almost bare of vegetation, whilst in another the plants may appear thinly scattered or crowded together in masses. Rocky projections might vary with deep recesses or caves, or solid rocks with scattered fragments, and here and there grassy banks or a trickling stream might still further vary the scene. A series of different pictures welded into one is perhaps the best definition of what a large rock garden should be.

Not only should the features of such a rock garden vary as much as possible, but there must also be different modes of access. We may, of course, have a comfortable main gravel walk winding through the rocks, and branching off from this we may have a few smaller paths winding still more, but to make every part of the rocks accessible by means of such paths would be a great mistake. There would have to be too many paths, and these would detract from a natural appearance. On the other hand, it is most desirable that a rock garden should be so arranged that every plant can easily be reached, but this can be done without formal paths. One of the easiest and, at the same time, most natural ways of accomplishing this is by means of irregularly connected patches of grass between the groups of rock or by stepping-stones protruding irregularly from a carpet of flowers and greenery. On sloping ground a dried-up streamlet forms a most convenient mode of access, as it can be made to appear most natural. I will have more to say about the construction of this. But on abruptly sloping ground the most convenient and practical method of communication between the highest and the lowest parts is by means of steps. Steps which are in direct continuance of a path might be made perfectly regular either of wooden slabs or stones—preferably the latter—because they would be permanent and not liable to decay. Among the irregular portions of a rock garden rocky steps are more convenient and picturesque. Rocky steps should be a comfortable staircase without in the least looking like one.

ROCKS ON A LARGE SCALE, WITH ROCKY STEPS LEADING TO HIGHER PORTION.

Such rocky steps are plainly shown in the accompanying illustration of the rock garden at Oldway, Paignton. Though easily ascended, these steps are at the same time very irregular, and form, as it were, part of the rocks themselves. In making them care was taken to furnish them with suitable plants, so arranged that they would partly clothe the rocks without impeding access. Admirably adapted for such a purpose are plants like *Veronica repens*, *Thymus lanuginosus*, *Arenaria balearica*, *Veronica alpina*, and others of a similar nature.

In this rock garden the rocks are irregularly stratified, consisting, in fact, of limestone. On the left, in the background of the picture, will be seen a cave formed by what appears to be massive rocks, from which descends a small stream of water feeding a Lily pool and a bog-bed in the foreground. The surface of these rocks is not plastered in any way, but shows really the natural stone itself. The boulders forming the cave have the appearance of blocks of stone weighing fifty tons or more. In reality few of the stones weigh more than one ton, but these are joined together in such a way that they appear united. Most of the large rocks so constructed have their interior filled with soil for plants. The cave shown is a roomy one, and will form a cool retreat during hot weather. It is approached on one side through a cleft in the rock, and, on the other, by means of stepping-stones below the waterfall.

During the construction of this rock garden care was taken to group the plants in such a way that distinct features were produced. Small rocky beds were reserved exclusively for small alpine of the choicer kinds; in other portions were grouped colonies of *Opuntias*, *Aloes*, &c., while rock shrubs in great variety adorn the bolder and more massive rocks. In the construction considerably over 1,000 tons of stone were used, and the picture shows only a portion of the work.

Elmside, Exeter. F. W. MEYER.
(To be continued.)

ORCHIDS.

DISA CLIO.

AS mentioned in THE GARDEN last week, Sir William Smith Marriott, the Down House, Blandford, Dorset, kindly sent flowers of the new *Disa Clio*, a hybrid raised at Blandford between *D. grandiflora* and *D. Veitchii*. *Disa Clio* is thus a secondary hybrid, *D. Veitchii* having been raised by crossing *D. racemosa* and *D. grandiflora*. The latter species bears flower-stems some 18 inches high, and the lower sepals of the large blooms are bright scarlet, while the upper sepal is of a lighter colour. *D. Veitchii* has flowers smaller than those of *D. grandiflora*, of a rosy-purple colour. The new hybrid has large flowers, whose lower sepals are a lovely rich rose colour, the upper one being rather paler.

The advent of *Disa Clio* brings the number of hybrid *Disas* recorded to five. The others are *D. langleyensis* (*racemosa* × *tripetaloides*), pale rose; *Kewensis* (*grandiflora* × *tripetaloides*), rose-pink; *Premier* (*Veitchii* × *tripetaloides*), purplish-rose; and *Veitchii*. There is room for this latest hybrid, for the flowers are large and handsome, and the plant is evidently a vigorous grower, judging from the specimens shown by Sir William Marriott at the Holland House show.

FOUR NEW CATTLEYAS (NATURAL HYBRIDS).

THE following new and beautiful natural hybrid Orchids were recently in flower in the Woodlands collection:—

CATTLEYA × LUCY EMBRY.

This is a very pretty natural hybrid. The parents are probably *C. guttata* var. *Prinzii* × *C. granulosa*. It has much the appearance of a good variety of *Prinzii*, but has none of the callonities of the lip so characteristic in that variety. The granulosa character, however, is well brought out in the two lower sepals. The flower is of a perfect shape, and the sepals and petals are of a pleasing light rose shade, interspersed with a number of magenta-coloured spots, which are very noticeable on the edges of the petals. The extreme edges of the petals are creamy white. The sepals are remarkable in having a rather thickened green apex,

DISA CLIO. (The flower is about 5 inches across.)

and the blade of the lip is of a deep purple-crimson, the lobes are white with a very striking pink flush, which is deepest on the outer surfaces.

CATTLEYA × PHILIP MEASURES.

A very distinct and handsome natural hybrid, the sepals and petals much resembling those of *C. granulosa*. They are of a charming shade of ochre orange, stained with a suspicion of red ochre, interspersed with minute crimson spots. The front lobe of the labellum is of an exquisite purple-crimson, which diminishes in density towards the base. The side lobes on the outside are of a pleasing pink, which shades away almost to white towards the base, and the inner sides of the lobes are creamy white, with a faint suffusion of pink on the upper edges. Another fine form noticed was

CATTLEYA × MME. BERNARD.

a very pretty and charming natural hybrid, somewhat resembling the brilliant one just spoken of, viz., *Philip Measures*. In reality it is very near that, but differs in the sepals and petals being more sombre. They are, however, of a most exquisite soft colour, marked with a number of dark crimson spots, which are particularly noticeable at the apex of the petals, on the edges of which there

is a slight suffusion or veining of claret colour. The front lobe of the labellum is of a rich purple-crimson, which also diminishes in density towards the base. The side lobes are almost clear white, with a suffusion of pink on the edges.

CATTLEYA KRAMERIANA,

a natural hybrid, supposed to have its origin in *C. intermedia* × *C. Forbesii*, which latter it more resembles than the former; it has the appearance of a glorified *Cattleya Forbesii*. The flower is not altogether showy, yet it is really beautiful, notwithstanding its rather narrow pale lemon-coloured sepals and petals. The sepals have rather a thickened green apex. However, the real beauty of the flower is brought out in the exquisitely marked lip, which is traced and veined, with a lovely shade of chestnut-red, the interspaces being filled with a soft orange colour, paling on the front lobe, the edges of which are creamy white. From beneath the column towards the front edge of the lip run two distinct toothed lines of a chestnut-red, which are suffused in the mid-vein to a soft orange colour. It is very rare indeed that four natural hybrid *Cattleyas* can be found in bloom at one time, and only in such princely collections as Mr. Measures' can such fine things be found at all. The above new Orchids have been imported by Mr. Measures, and exist only in the Woodlands collection.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

LITHOSPERMUM PROSTRATUM.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—“M. L. W.” in the “Notes from Swanswick” in THE GARDEN of June 27, kindly gives me some useful hints as to the successful culture of the double crimson Sweet William, for which I had previously asked in your columns. I will attempt to repay your correspondent with my experiences in growing *Lithospermum prostratum*, which does remarkably well with me here in Kent, so much so that I have never lost a single plant or had a sickly one so far. My advice to those desirous of growing and successfully flowering this plant may be briefly summed up as follows: Begin with good well-rooted specimens (mine came from Anthony Waterer of Knap Hill), plant carefully in light loamy soil, with sand and leaf-mould or peat added, but no manure of any kind, in a warm, sunny, and well-drained position, the roots being close against the edging stones of the rockery, or other stones deeply fixed in the soil, and more or less above the general ground level. Those that succeed and flower best with me are raised from 1 foot to 2 feet only. I seldom give any water, except in a spell of very dry weather in spring or summer, when they get an occasional soaking with rain-water. Of course, I cannot expect this lovely plant to grow as rampantly and flower as freely here as it does, for example, in the gardens at Treco Abbey in the Scilly Islands; but it is a pleasure to have nice healthy specimens, hardly ever without a few flowers on them at least, and with no sickly yellow foliage to disfigure them. Probably the presence of lime in the soil is detrimental to *L. prostratum*; my neighbour, Mr. J. C. Ley, thinks so, and I am inclined to agree with him. It may be only fancy, but it looks like a “lime-hater.” If this is the case no doubt sandstone would be better for it than my Kentish “Rag,” though with good sound hard blocks of the latter there can be only an infinitesimal amount of lime dissolved by rain or artificial watering.

Yalding, Kent.

S. G. R.

LILIES DISEASED.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—This season has been absolutely the worst I have noticed, as far as the Lily disease is concerned. The old Madonna has been almost a complete failure here. Long before the flower-spikes

attained anything like their full height they were attacked by the disease. I have recently been judging small holdings and cottage gardens, and what struck me most in these gardens was the splendid lot of *Lilium candidum*. There were large clumps and fine spikes 8 feet high, and in some cases from a dozen to eighteen flowers on a spike. But I also noticed that very few of the Lilies were quite free from the disease, and in one case the lady who had charge of the flower garden complained that "the Lilies were not as fine as usual, and that something had happened to them," which she attributed to some one's carelessness in watering with "salty water." It was, however, only too plain that the disease had taken hold of them.

An expert who was looking over the gardens here told me that there were two forms of the Madonna Lily, *L. candidum* and *L. c. speciosum*. The latter variety is of Continental origin, and more susceptible to the disease than the type; indeed, he said it was the variety which had spread the disease over the country. That two distinct forms have found their way into this garden there is no doubt. Another thing which is equally clear is, when I first took charge the disease was unknown. The Madonna Lily was abundant and good, and no trouble was experienced. There have been many bulbs added, chiefly from the cottagers' gardens, as well as a few for the purpose of forcing and afterwards planted out. A strange thing about it is that this Lily will force slowly and produce perfectly healthy plants as well as fine spikes of flower. But, however carefully the bulbs are harvested and afterwards planted out, they take the disease badly the first year, and are useless afterwards.

Remedies are numerous, and, as far as my experience goes, useless also. I treated 500 bulbs in the following way: I dug them up in August, spread them on mats in the full sun. After they had become quite dry they were covered with sulphur and fully exposed to the sun. They were frequently turned about in the sulphur. After a fortnight of this kind of treatment, I placed them in a cement cask in layers, and covered each layer with black sulphur. The casks were covered over by a close-fitting lid and kept perfectly dry. At the end of September they were planted in a rather poor light soil. Each bulb was placed on coarse road sand and a little sulphur. They grew well, and the first season all looked like succeeding. Fairly good flower-spikes were produced and healthy foliage. This year, however, they are a complete failure, not a trace of foliage could be seen at the end of June. In the hardy border, however, there were, and are now, some fairly good spikes of bloom, and these are struggling among German Iris and other strong-growing plants. Is it shelter they require early in the spring? A.

IRIS MONNIERI AND IRIS AUREA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—The above are two of the best late Irises in cultivation. No garden where hardy plants are grown is complete without these Irises; both are most striking and ornamental plants. Perhaps they require a little more care than the ordinary German varieties. They certainly like good soil and plenty of moisture during the warm weather, and less of the latter during the winter months. When well grown they are noble plants; the colour of the flower is a good yellow. One thing I have noticed about these Irises is, that they certainly do like a change of soil oftener than the German varieties. If left in the same place for several years they become weak and gradually die, starting from the middle of the plant. They, however, soon recover when divided and planted in new and good soil. This season, in common with most things in the garden, they came into flower very late—second week in July—just while we were experiencing a short spell of hot weather, consequently they did not last quite so long as one could wish. A bold group of these Iris well flowered is a distinct feature in the hardy border.

I remember seeing them in a most flourishing condition in the late Rev. H. Ewbank's garden.

I. Monnieri was from 3 feet to 4 feet high. The flowers were correspondingly large, and, being planted in a bold group, the effect was good. Some time after several large pieces were sent here from the Ryde garden. These Irises have done fairly well here, but neither has attained anything like the vigour they did at Ryde. Another distinct Iris I saw, and which was afterwards sent here from St. John's, was *I. spuria*. This is a very free flowering species, making free growth. The colour of the flower is distinct yellow and greyish blue. It is by no means rare, but I mention it because it is interesting, and a fairly good border plant. This is not so particular about soil, and will thrive under the same conditions as the ordinary German varieties.

Cirencester.

A.

HUMIDITY IN FRUIT HOUSES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In a recent issue of *THE GARDEN* Mr. Parker directs attention to the question of the atmospheric treatment of houses for the forced growth of Peaches and Vines. With many of the items set forth in Mr. Parker's notes the majority of your readers will readily agree, because in them are embodied plain truths, and the results of experience. Mr. Parker very truly says that the modern structure is made as air-tight as possible, at the same time suggesting that the old time vinery was not so much so, but, except for the smaller squares of glass used, I do not think much fault could be found with their air-tight state. In the modern structure the process of ventilation is simplicity itself. A hundred feet can be ventilated with greater dispatch than one light can often be opened in the old-fashioned roller-sliding, weight-balanced ventilator. Mr. Parker deals with imperfect ventilation; another evil almost equally dreaded has probably not troubled him much, namely, mildew. Two instances occur to my mind where mildew was introduced by changes of attitude on the part of those in charge. In one, the vinery had been allowed to lapse into a state of dilapidation, which was continued for some time, sufficient, at any rate, for the vines to have become accustomed to their airy surroundings. The time came when repairs became necessary, and those in charge of the Vines, not taking into account the more air-tight state of the house, gave similar treatment to that so long practised. The consequence was the atmosphere became over-charged with sun-heated vapour before air was admitted in the morning, and before long traces of leaf mildew were evident. The evil of mildew on Vines is that, once established, there is much difficulty in again eradicating it entirely from the house. It cannot always be stamped out in a season. The second case referred to was brought about simply by the laxity of the attendant in giving air in the early morning, and the sun striking on the roof early made the temperature rise above its normal state. An effort then to reduce this excess of heat by widely-opened ventilators brought in the fungoid fiend, attacking as it did, both leaf and berry. For several seasons efforts were made to stamp it out, and only by the persistent use of sulphur and other specifics was it destroyed. It is a good rule in summer time to open the ventilators before the sun has an influence on the inside atmosphere. If this is done the danger of promoting an over-heated and stuffy atmosphere is avoided for the rest of the day, and instead there is a coolness, even under the midday sun, that could not be otherwise obtained. Needless to say a gradual extension of the ventilators is necessary. Mr. Taylor, when gardener at Longleat some years ago, made it an invariable rule in spring and summer for the ventilators of the famous vinery in those gardens to be opened at 6 a.m., no matter what the state of the weather might be. Sufficient warmth came from the hot-water pipes to keep the atmosphere buoyant, and with a perfect system of ventilation in the spacious roof lantern no harm arose even without sun or from a rainstorm.

One remark of Mr. Parker's is not quite clear, wherein he says, "the foliage that has been

dripping with moisture all night is subjected to, perhaps, two hours' sunshine before ventilation is given to allow undue moisture to escape." An excessive use of the evaporating trough and late damping down of the floors must be practised to bring about a dripping state of the foliage in the early morning. I find the air of the house, and consequently the foliage, to be dry at this early hour, often so much so that a little damping down is at once beneficial. I find air roots are emitted by Vines that are forced early in houses not sufficiently pipe-heated. With ample hot-water pipes to maintain the requisite temperatures, without resorting to excess of fire-heat, a more equable state of atmospheric moisture and temperature is maintained. These roots, too, once set in action, can be accelerated in their growth by the use of liquid manures in the evening for damping the floor surfaces. This we have proved for several years, and we do not look upon these air-fed roots with any misgivings as to their cause or purpose. Vines with their roots partly outside and partly in produce these air roots freely when forced rather early in the year. We have one small house thus treated that each year provides air roots, and these same Vines not only give a very good and useful crop, but continue in robust health and vigour.

Other divisions of the same range do not produce air roots, because they are started more naturally into growth, and there is not the same need for the long-continued closed ventilator. A dry and atmosphere, caused by the presence of a boiler flue, may easily bring about an attack of red spider if that particular spot be neglected in the matter of ventilation, damping down, or a timely syringing.

W. STRUGNELL.

THE DOUBLE CRIMSON SWEET WILLIAM.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I notice that enquiries have been asked regarding this plant, and on page 66 Mr. Jenkins gives valuable information as to its behaviour in heavy soil. I observe he has not found it a success in light soils. Regarding its culture in the latter I may say that when residing at Farnborough Grange, Hants, I grew this with many other uncommon hardy plants, such as the small double White (or Scotch) Rocket and the old double Siberian Larkspur. The gentleman I served had an intense love for hardy plants, and the double Sweet William was a great favourite. Accordingly, I made every effort to grow it, and I found no difficulty in keeping up a stock of healthy plants. My method was to propagate some plants every year by cuttings, rooting them in July under hand-lights and planting them out in early spring. They flowered so profusely the second year that generally they were of no further use, and having young stock they were destroyed.

Charl.

J. CROOK.

THE PINE-APPLE IN THE TROPICS.

Of all the strictly tropical fruits there is none that is grown as extensively as the Pine-apple. Many thousands of acres are devoted to its culture in Southern Florida, which is the only section where it succeeds within the United States. Our markets are so well supplied with the home-grown product that but few Pine-apples are imported, although a few years ago all that were consumed were grown in Jamaica and other tropical islands. There are two methods of culture. One is in the open field, just as Cabbages are grown. The other plan is to plant under lath sheds, which admit of growing the most tender varieties; fruit of the largest size and most delicious flavour is then obtained. The variety generally grown under sheds is the Smooth Cayenne. Abakka and many others are also grown to some extent. These sheds are about 7 feet high, and are made in a substantial manner. It has

been found by experience that shedding not only makes it possible to grow Pine-apples where there is a little frost, by covering over with maulin in winter, but the shedding does good in summer by tempering the fierce rays of the sun. Red Spanish is the variety commonly grown in the open field. The plants are set about 2 feet apart each way and kept free from weeds. They bear about two good crops, and are then dug up and the ground replanted.

H. E. VAN DEMAN.

GARDENING OF THE WEEK. THE FRUIT GARDEN.

PEACHES.

SHOULD we have a change to dry weather one of the most important matters in the management of late Peaches under glass will be the liberal application of water to the roots and foliage. With every leaf and branch spread out and trained within 2 feet of the glass, a mere surface watering is of very little use to inside borders at any time, and when the heavy strain of a full crop is in force a

off and properly repaired and painted under cover, when the material used will last much longer than it would do after the houses are at work and the wood is more or less charged with mixture.

SUCCESSION HOUSES.

As these are cleared of fruit the first work will be copious washing to cleanse the foliage and watering to set the roots and lateral shoots in action. Then will follow the annual cutting away of the shoots which can be dispensed with to ensure the proper ripening of the trees.

MELONS.

Where efficiently heated pits or houses are used for winter Cucumbers the last batch of Melons should be put out. If some free, quick turning in variety, like Eastnor Castle, Blenheim Orange, or Improved Victory of Bath, is used, the crop will be ripe by the middle of October, which is quite late enough to expect really good-flavoured fruit, and a very good time for putting out strong plants of Telegraph Cucumber. Unless the weather continues very bad no fire-heat will be needed before the female blossoms begin to open, but it will be necessary to plunge the pots in a brisk heat of 80° to 90° from fermenting leaves or tan, and to place them within the influence of the bottom-heat pipes, as they

should everywhere present a tidy appearance. The extreme heat experienced last month has been most trying to many things, but where sufficient labour has been at command to keep them well supplied with water many of the summer-flowering plants are now a wealth of blossom. If a good mulch has been spread over the beds, as previously advised, Tea-scented Roses and many herbaceous plants will continue to bloom profusely, even though no water may be given them.

ZONAL PELARGONIUMS

are now very beautiful and attractive, and will soon be at their best. Pick off old flower-trusses and seed-pods; these, with all decaying leaves, should be picked off at least once a week, and the soil thoroughly watered, manure water being occasionally used to stimulate the growth. Attend to the tying up of all tall growing plants to prevent wind and rain breaking them down and thus spoiling their beauty. Continue to peg down and regulate the growth of all trailing plants such as Verbenas, Heliotropes, and Petunias, so that the soil may be covered as speedily as possible. This is also the flowering season for one of the most beautiful annuals we have, Phlox Drummondii, and as every year brings forth new varieties, some of which may be superior to the old, it would be well for amateurs and others to make themselves familiar with the new strains. *Grandiflora coccinea* is a fine scarlet; *G. splendens* a vivid crimson. The Star varieties, with white margins, are also very fine.

LILIUMS.

Lilies may be planted out from August to April, or later, according to the season, but it may be laid down as a rule that all Lilies are best removed to their allotted stations as soon as possible after flowering. Lilies planted now will get the benefit of the first rains that fall, which will cause the emission of new roots, which maintain their activity all the autumn and winter. The Madonna Lily may now be lifted with entire safety. With this Lily avoid deep planting, nothing is more injurious to it than having its bulb 6 inches or 8 inches below the surface. *Lilium chalcidonicum*, on the other hand, should be planted not less than 6 inches deep; a light rich soil suits it well. Never apply fresh manure at the time of planting; this is generally held by all Lily growers to be fatal to the bulbs. A good mulching of thoroughly rotten manure during the winter months will be found to be most advantageous. T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

INDOOR GARDEN.

RICHARDIA AFRICANA.

PLANTS that have been allowed to remain in a dormant condition until now should have the old soil shaken out and the tubers sorted over into two or three sizes. Pot them up in a compost rich in humus, and rendered porous by the addition of coarse sand or broken oyster shells. The largest tubers should be potted singly in 8-inch pots, and for the second size 6-inch will be sufficient. Where it is necessary to increase the stock the smallest tubers may be potted three round a 6-inch pot. If large specimens are required select three or four tubers of equal size that will make a uniform plant. These may be potted into 9-inch or 10-inch pots, according to the strength of the tubers. Drain the pots well, as the plants when growing require plenty of water. After potting place the plants in a cold pit, and give but little water until they begin to make fresh roots.

TULIPS.

The same treatment and soil as recommended above are suitable for all the early varieties of Tulips. Narcissi are better when grown in pots. I find them more difficult to lift and make up than either Hyacinths or Tulips, they also prefer a little stronger soil; and, except for the very early Polyantha varieties, such as improved Paper White and Soleil d'Or, it is desirable to add a little well rotted cow manure to the compost. Of the early varieties named five bulbs may be placed in a 6-inch pot, and of the later strong growing varieties three bulbs will be sufficient; in each

PINE-APPLES IN SOUTHERN FLORIDA.

watering that does not reach the drainage frequently induces the premature ripening of the fruit. To avoid this, let all inside borders be heavily mulched and well watered. Syringe copiously every fine morning, and again about four o'clock in the afternoon, when the house may be closed for two hours to swell the fruit. Elevate all the Peaches that can be got up by placing short pieces of lath under them and across the wires of the trellis. Give night air, much or little, according to the intended period of ripening, and, if portable, draw the lights quite off for a few hours on fine settled days to infuse colour and to give the fine flavour which Peaches grown in cold or warm houses never attain. When elevating the fruit make a point of shortening back every shoot that will be taken out after the fruit is gathered, for the twofold purpose of increasing the size and letting in light and air. The weather up to the present time has not been sufficiently warm and settled to admit of stripping the early house; but in the event of a change the lights may be taken

will be indispensable when the fruit is setting and ripening. They will then grow away freely without a check, and will set plenty of fruit on the first laterals. If 12-inch pots are used allow each plant to carry a pair of evenly-set fruit. Top-dress when they begin to swell, and feed at every watering. Keep the plants thoroughly under command in pits and frames. Train the leading shoots towards the extremities, pinch out the points when 1 foot from the sides, thin out the laterals, and fertilise every flower as it opens. Feed well and water overhead with water at a temperature of 85° to 90° about 3 p.m., and shut up for the day. Cover up at night, and give a little air to let out steam, as linings must not be neglected for bottom-heat. WILLIAM CRUMP.

Madresfield Court Gardens.

FLOWER GARDEN.

JUST at this time of the year the pleasure grounds and the flower gardens are full of interest, and

case allow half an inch of the apex of the bulb to appear above the soil. When the potting and boxing are completed give them a good soaking of water, and allow them to remain in the shed or under cover until the next day, when they may be plunged in fine ashes, covering them 2 inches or 3 inches deep. Select a space for them shaded from the full sun and free from stagnant water.

ROMAN HYACINTHS.

The season for planting these is again at hand, and for the earliest crop of flowers bulbs should at once be potted. Boxes of convenient size, 2½ inches deep, may be used in which to plant the bulbs; first fill them three parts full with a light rich soil, composed of loam, leaf-soil, and one-fourth part of old Mushroom-bed manure, rubbed through a fine sieve to destroy any grubs, with a good addition of sand, press the soil firmly and place the bulbs 1½ inches apart each way. Fill up the boxes until the apex of the bulb only is exposed. One advantage of the use of boxes is, that as the bulbs lift readily when in bloom, pots can be made up of uniform appearance as required.

CALCEOLARIAS.

As soon as the young seedling plants are large enough to handle prick them off five or six round the rim of a 3-inch pot, and for a week or ten days keep them rather close in a cold moist frame, raised near the glass and shaded from the sun. Sprinkle them lightly overhead each morning.

Wendover.

J. JACQUES.

THE KITCHEN GARDEN.

SPINACH FOR WINTER.

This is a very important crop, providing as it does in winter many dishes of a wholesome green vegetable. A good breadth may now be sown, and another in ten days or a fortnight. A plot of ground that has carried an early and not too exhaustive crop, such as Peas, Beans, Lettuce, and the like, will suit Spinach, and no manure will be required at this time. Make the ground level and tread firm, and sow the seed thinly in drills 15 inches apart. If the ground is dry a good watering should be given the preceding day. Good varieties are The Carter and Prickly.

COLEWORTS.

As soon as the plants are large enough plant out on a piece of good ground. These may be planted closer together than is advised for the ordinary Cabbages that are to stand the winter. They do not usually attain to large size, and do not remain upon the ground for any length of time.

MUSHROOMS.

The beds made up in the open as advised in a previous calendar will now be bearing, and the surface must be kept covered with sweet litter to conserve moisture. Avoid giving water as far as possible, but should it be necessary to do so let it be lukewarm, and remove the litter during the operation. One or two applications of well-diluted liquid manure will be beneficial just as the "buttons" commence to show. Manure should now be collected for forming beds in the Mushroom house; the produce from beds made now should closely follow those from the outside ones and from the fields. I am in favour of retaining a good portion of the straw in the manure for mixing with the droppings, and beds formed of these alone are apt to be wet, and quickly become cold and unproductive.

CUCUMBERS.

Seed may be sown for producing plants for fruiting in winter, or cuttings may be put in a week or ten days hence for the same purpose. Plants that are still bearing must have the unfruitful wood removed, and every care taken of that showing fruit by tying to the trellis as growth progresses. Cut all well-shaped fruits as soon as they attain a useful size, and place on end in 1 inch of water. All malformed ones should be cut off while small. Feed the plants frequently, and top-dress with rich soil when white feeding roots show upon the surface of the soil.

Stonleigh Abbey Gardens.

SOCIETIES.

SOUTHERN COUNTIES CARNATION SHOW.

THIS is one of the most important societies in the south and the exhibition recently held was excellent in all ways. It was the sixth annual display, and the best, probably, that has taken place. It was held in the Pavilion of the Royal Pier, Southampton, happily in fine weather, and there were no fewer than 350 entries, apart from miscellaneous exhibits. The

MISCELLANEOUS EXHIBITS

filled a large space, and contributed greatly to the brightness of the show. Messrs. W. H. Rogers, Limited, had a most tasteful display. Messrs. W. Cutbush and Sons, Highgate, showed some superb Carnations; and a miscellaneous group of Palms and other plants came from Mr. Garton, Roselands, Woolston. A pretty little group from Mr. W. Garton, jun., attracted much attention; the Carnations were excellent. Sweet Peas were finely shown by Mr. Breadmore of Winchester. Messrs. Blackmore and Langdon of Twerton Nursery, Bath, had a collection of their wonderful tuberous Begonias. These were one of the features of the show. A very pretty exhibit consisted of the hybrid and other Nymphs from Messrs. Phillips and Taylor, Bracknell, Berks. The well-known firm of Messrs. B. Ladhams, Limited, of Shirley, had a delightful group of hardy flowers, including many of their beautiful Pinka. Another Shirley horticulturist, Mr. E. Wills, also had a miscellaneous exhibit.

The Carnation flowers were very fine, especially the fancy and yellow ground varieties. A Southampton grower, Mr. J. J. Keen, was very successful. Besides the Carnation class there were classes for

SWEET PEAS.

For the table of Sweet Peas nine competed, and the prizes were given by Messrs. B. Ladhams of Shirley. The first prize winner was Miss M. Snelgrove with a very light and pretty arrangement; Miss S. E. Burt was second, and Mrs. Minsbrook, Athery Road, North Southampton, was third. Nine distinct varieties in bunches of thirty, open (prizes presented by Mr. R. Sydenham, Birmingham): First, large silver medal, Mr. A. Maple, Aldermore; second, silver medal, Mr. R. H. Jeffrey; third, Mr. C. A. Linzee.

Nine varieties Sweet Peas in bunches of thirty (prizes presented by Messrs. Toogood and Sons, Southampton): First, Toogood Championship Challenge Shield, Mr. H. H. Lees, Grosvenor Road, Portsmouth; second, Mr. A. Maple; third, Sir Samuel Montagu, Bart., South Stoneham House (gardener, T. Hall).

Nine bunches Sweet Peas, distinct (prizes offered by Mr. C. W. Breadmore, Winchester): First, Mr. F. M. Middleton, Old Alresford; second, Mr. A. Maple; third, Mr. R. H. Jeffrey.

Dinner table decorated with Carnations and Picotee flowers or both: First, Miss Snelgrove; second, Mr. R. H. Jeffrey. Carnations, flakes and bizarres, twelve blooms, dissimilar: First, Mr. F. A. Wellesley, Woking; second, Messrs. Thomson and Co., Birmingham; third, Messrs. Pemberton and Son, Walsall. Six blooms, dissimilar: First, Mr. J. Fairlie, Acton; second, Mr. J. J. Keen, Avenue Road, Southampton; third, Mr. D. Walter, Kilmarnock.

White ground Picotees, twelve blooms: First, Messrs. Pemberton and Son; second, Messrs. Thomson and Co.; third, Mr. F. A. Wellesley. Six Picotee blooms, dissimilar: First, Mr. J. Fairlie; second, Mr. J. J. Keen; third, Mr. W. Spencer, jun., Windsor.

Yellow ground Picotees, twelve blooms, dissimilar: First, Mr. Martin E. Smith; second, Mr. F. A. Wellesley; third, Messrs. Thomson and Co. Six blooms, dissimilar: First, Mr. J. J. Keen; second, Mr. W. Spencer, jun.; third, Mr. E. H. Buckland, Southgate House, Winchester.

Yellow grounds and fancy Carnations (white grounds, self flowers, and yellow ground Picotees excluded), twelve Carnation blooms, disimilar: First, Mr. F. Wellesley; second, Mr. Martin E. Smith; third, Mr. E. J. Wooten. Six Carnation blooms, disimilar: First, Mr. W. E. Parton, jun., King's Heath, Birmingham; second, Mr. W. Spencer, jun.; third, Mr. J. Fairlie.

Selfs, twelve Carnation blooms, disimilar: First, Messrs. Thomson and Co.; second, Mr. Martin E. Smith; third, Mr. F. Wellesley. Six Carnation blooms, disimilar: First, Mr. F. W. Flight; second, Mr. W. H. Parton, jun.; third, Mr. David Walker.

SINGLE BLOOMS.

Carnations, bizarres and flakes, scarlet: First and second, Messrs. A. Pemberton and Son. Crimson: First, Mr. F. Wellesley; second, Mr. R. Sydenham. Pink: First, Messrs. Pemberton and Son; second, Messrs. Thomson and Co. Purple flakes: First and second, Mr. F. Wellesley. Scarlet flakes: First, Messrs. Pemberton and Son; second, Mr. F. W. Flight. Rose flakes: First and second, Messrs. Thomson and Co.

Picotees, red heavy edged: First, Mr. J. J. Keen; second, Mr. W. Spencer; third, Mr. F. Wellesley. Purple heavy edged: First and second, Messrs. Pemberton and Son; third, Mr. D. Walker. Rose heavy edged: First, Mr. W. Spencer; second, Mr. R. Sydenham; third, Messrs. Thomson and Co. Scarlet heavy edged: First and second, Messrs. Thomson and Co.; third, Messrs. Pemberton and Son. Red light edged: First, Mr. J. J. Keen; second, Mr. S. Hayter; third, Mr. R. Sydenham. Purple light edged: First, Mr. W. Spencer; second and third, Mr. F. Wellesley. Rose or scarlet light edged: First, Mr. F. Wellesley; second and third, Mr. J. J. Keen. Yellow ground heavy edged: First, Mr. J. J. Keen; second and third, Mr. F. Wellesley. Yellow light edged: First, Mr. H. W. Matthias; second, Mr. E. H. Buckland; third and fourth, Mr. E. Smith.

Selfs, any colour: First, Mr. E. J. Wooten; second, Mr. F. Wellesley; third, Mr. M. R. Smith. Fancies (single bloom): First, Mr. F. Wellesley; second, Mr. M. R. Smith; third, Mr. W. Spencer.

Premier Carnations—Bizarre: Mr. F. Wellesley, with S. Hedderley. Flake: Messrs. Pemberton and Son with

Flamingo. Self: Mr. W. Spencer, jun., with Sir Roy's Fancy: Mr. F. A. Wellesley with Charles Martel.

Premier Picotees, white ground: Mr. F. A. Wellesley with Fortrose. Yellow ground: Mr. H. W. Matthias, Thames Ditton, with Pilgrim.

HUYTON AND ROBY.

THIS popular annual event was held in the grounds attached to the Public Offices, and was, notwithstanding the wet weather, attended with good results. The exhibits were fully up to the average, the greenhouse flowering plants being perhaps as near perfection as one could wish, while the fruit and cut flowers were never seen to greater advantage.

There were two excellent groups of plants for effect, the first prize going to Mr. T. Henshaw (gardener, Mr. J. George), Whitfield House, Roby; Mrs. Harding (gardener, Mr. H. McFall) was a close second.

The stove and greenhouse plants, superb Caladiums, and fine specimen Fuchsias made a bold lead for Mr. G. H. Nisbett (gardener, Mr. J. Hare), Huyton Hey House. Mr. A. Mackenzie Smith (gardener, Mr. W. Lyoe) was a successful winner in many classes—the two classes of double Begonias, single Orchid, four Gloxinias, Ixora Pilgrimii (which also gained the special prize for the best specimen in the show), and for sprays and buttonholes. Mrs. Harding had the distinction of taking the prizes for Ferns, single Caladiums, and well-coloured Coleus. Mr. J. Stone (gardener, Mr. D. McKelvie), Blacklow House, Roby, won with well flowered specimen Liliums, superbly coloured table plants, and stove cut flowers.

Roses were only moderate, Mr. W. H. Crook (gardener, Mr. J. Burrows) taking a good lead in three classes, also with a capital selection of Sweet Peas. Herbaceous plants contained the unusual selection shown at this season, Mr. Henshaw securing both prizes with a charming assortment well set up, and was first for twelve Carnations.

The table decoration special prizes went to Mrs. Harrison for a somewhat heavy arrangement of deep rose Sweet Peas, grasses, and Smilax tracings; Miss McCollum second with Iceland Poppies; third, Miss Fishwick with Plumbago capensis.

Mr. J. Beechan, J.P. (gardener, Mr. W. Oldham), Ewanville, Huyton, was invincible in the fruit classes with handsome black Hamburg Grapes, Royal Sovereign Melon, Royal George Peaches, and Violet Hative Nectarines; Mr. J. Stone was an excellent second.

To deal with the numerous vegetable classes would encroach on space too much. It only need be said that for quality and keen competition in both professional and cottagers' classes, they would surpass anything hitherto seen in the neighbourhood. Mr. T. Henshaw, Mr. A. Mackenzie Smith, and Mrs. Harding were the leading winners in the open class. The society is indebted to many ladies and gentlemen for special prizes. Mr. George Roscoe winning Lady Derby's, and Mr. Wall Mrs. Partington's for the best kept allotments.

Mr. H. Middlehurst showed a rich selection of Sweet Peas, many new ones included. Mr. C. Young, West Derby, had some boxes of splendid Carnations. Messrs. Caldwell, Knutsford, had Roses and herbaceous plants of good quality, and Mr. Roby seedling Begonias.

NEWPORT (MON.) HORTICULTURAL SOCIETY.

THE annual show of this society was held, during fairly favourable weather, in King's High Fields, Newport, on July 29 and 30, and was opened by the Right Hon. Lord Tredegar (President). The exhibits on this occasion compared favourably with those of former years. Vegetables were of good quality and largely shown, Peas and Potatoes being excellent. Among plants, Achimenes in pans and Begonias were conspicuous for their good quality. The groups of plants were also generally of much merit, and dinner table decorations were remarkably well done. Cut flowers were staged in great quantities, the herbaceous and perennial section being exceptionally good, while the leading stands of Roses contained some capital blooms. Fruit was fair in quality, Gooseberries and Cherries being excellent.

ROSES.

Teas, twelve blooms: Messrs. Townsend and Sons of Worcester, who had a good stand, secured chief honours with good blooms of Bridesmaid, Mrs. E. Mawley, Ernest Meix, The Bride, White Maman Cochet, &c.; Mr. S. Tredder, The Nurseries, Cardiff, was a good second.

Twenty-four Hybrid Perpetuals: Messrs. Townsend and Sons were again first, and staged as their best blooms Captain Hayward, M. Etienne Levet, Ulrich Brunner, Suzanne M. Rodocanachi, Helen Keller, Mile. M. Verdier, Lady Sheffield, Earl Dufferin, &c.; Mr. S. Tredder was again placed second.

Twelve glazes Sweet Peas: Only one exhibitor staged in this class, namely, Mr. Baahane, Fair Oak Nursery, Bamsaleg, but he put up a meritorious lot of choice varieties, and was deservedly awarded the first prize; while for twelve varieties of Carnations, Messrs. Tuplin and Son, Newton Abbott, were the successful exhibitors.

HARDY FLOWERS.

These were splendidly shown in a space of 12 feet by 3 feet. Messrs. Stokes and Sons, Trowbridge, who took the lead, had an exceedingly good lot, and staged, as at Cardiff last week, their beautiful new Campanula Hillside Blue. Messrs. Heath and Son of Cheltenham were placed second, and also staged a fine lot of excellent varieties.

GROUPS.

Mr. Cypher did not this year stage in these classes, and there was in consequence a falling off in the quality of the leading group of miscellaneous plants of 11 feet square. For this Mr. Carpenter (gardener to W. J. Buckley, Esq., Llanelli), was placed first, and arranged a commendable group.

Miscellaneous plants in 50 square feet: In this class there

bright well-arranged collections of suitable plants were staged. The first prize, exhibited by Mr. Lewis, gardener to Dr. Garrod Thomas, Newport, was especially good: Mr. Powell, gardener to Colonel Wallace, Newport, was a good second. For a group in a space of 25 square feet there were six entries, and each of them was good; of these Mr. Wiggins, gardener to Mrs. Wallace, Newport, had the best.

PLANTS.

Begonias arranged in a space of 25 square feet: Three beautiful groups were put up in this class, composed of fresh plants possessed of bright showy flowers. The leading one came from Messrs. Heath and Sons of Cheltenham, and contained plants with remarkably large flowers of both single and double varieties; the second place was secured by Mr. Mitchell, gardener to W. J. Orders, Esq.; and the third by Mr. J. Jones, gardener to R. Williams, Esq.

Six stove and greenhouse plants in flower: Mr. Cypher was again missed in this class, and the only exhibitor was Mr. Carpenter, who was awarded the first prize for a nice lot of plants.

Six ornamental foliage plants: Here Mr. Duff, gardener to Mrs. Williams, Brynaglan, Newport, took the lead with good plants of *Cycas revoluta*, *Latania borbonica*, *Kentia forsteriana*, *Phoenix rupicola*, *Croton Williamsii*, &c.; Mr. Carpenter was placed second.

Six exotic Ferns: Mr. Duff again led with a well-grown set of large plants; Mr. Powell, gardener to Colonel Wallace, was a close second; there were four exhibitors in this class. Mr. Powell was first for six dinner table plants and staged small Palms, *Crotone*, *Aralias*, &c.

Achimenes in six varieties: There was close competition in this class amongst six exhibitors. Mr. Powell taking chief honours with large pans of *A. Admirabilis*, *Rose Queen*, *Scarlet Perfection*, *Grandiflora*, &c.; Mr. Wiggins, gardener to Mrs. Wallace, was second; and Mr. Harris, gardener to C. F. Colbourn, third.

Four Caladiums: For these Mr. Powell was again placed first, followed by Mr. Wood, gardener to H. Oakley, Esq., and Mr. Wiggins.

FRUIT.

Six dishes: Two exhibitors staged creditable collections, the best coming from Mr. Duff, who had Muscat of Alexandria and Black Hamburg Grapes, Early York Peaches, Governor Wood Cherries, a Melon, and Whinham's Industry Gooseberries. Mr. Watte, gardener to C. D. Phillips, Esq., was a near second.

VEGETABLES.

Mr. Duff was first for six dishes, for which Messrs. Sutton and Sons offered prizes, and staged good dishes of Cauliflower First Crop, Pea Duke of Albany, Tomato Eclipse, Carrot New Intermediate, Onion Allas Craig, and Potato Sutton's Supreme; second, Mr. Richards.

Six dishes, for which Messrs. Wheeler and Son, Gloucester, offered prizes: First, Mr. Richards, while Mr. Giddens took the lead for six dishes for which Messrs. Garaway and Co., Bristol, offered prizes.

TRADE EXHIBITS.

These did much in making the show a success. Mr. Baaham, Fair Oak Nursery, Basaleg, arranged a collection of fruit trees in pots, consisting of Peaches, Apples, and Gooseberries, carrying good crops of fruit. He had also a collection of about 50 dishes of hardy fruit. Messrs. Garaway and Co., Bristol, staged a large and choice collection of stove and greenhouse plants, &c. Messrs. Tuplin and Son, Newton Abbot, arranged a stand of Gladioli, Dahlias, Carnations, &c.; Messrs. Wheeler and Sons, Gloucester, a collection of herbaceous flowers in choice varieties; Mr. E. H. Jones, Newport, Begonias, Ferns, &c.; Mr. Baggesen, Cardiff, floral wreaths, &c.; and Mr. Thomas, florist, Newport, floral crosses, wreaths, &c.

A PANSY SHOW IN SCOTLAND.

The Glasgow and West of Scotland Pansy Show held its annual exhibition recently in the Trades Hall, Glassford Street. There was a very keen competition, and the show was quite a pretty one with the addition of hardy flowers and Roses. The miscellaneous exhibits were very charming. Messrs. Dobbie and Co., Rothsay, had a very choice assortment of Roses and Pansies in rich varieties and were deservedly awarded a silver medal, and received several certificates of merit. Another noteworthy exhibit was sent from Messrs. M. Campbell and Son of High Blantyre. The chief prize winners were as follow:

OPEN CLASSES.

For forty-eight blooms of fancy Pansies the prize was the champion gold medal; the winners were Messrs. A. Lister and Son, Meadowbank Nursery, Rothsay, with a choice set; Mr. J. Smellie, Busby, second; and Mr. A. Oller, Campbelltown, third.

For twenty-four blooms Mr. Charles Kay, Gargunnoch, won the silver cup; Mr. J. Smellie second, and Mr. W. Wilson third.

For eighteen blooms the silver medal was won by Mr. James Paul; Mr. C. Kay and Mr. J. Smellie second and third.

A very interesting class was for twelve blooms of seedling fancy Pansies, the first prize being won by Mr. Kay; Mr. J. Smellie and Messrs. A. Lister and Son second and third respectively.

Messrs. A. Lister and Son were first for six blooms of any variety of fancy Pansy; Mr. C. Kay was second, and Mr. T. McGregor third.

For twenty-four show Pansies Mr. A. Oller first, Mr. C. Kay second, and Mr. J. Smellie third.

Mr. C. Kay was first for eighteen blooms of Show Pansies; Mr. A. Frater and Mr. J. Smellie were second and third.

For six seedling show Pansies, Mr. Kay first; and Mr. J. Smellie and Mr. James Paul, Killearn, second and third respectively.

Mr. J. Smellie had the best seedling fancy Pansy flowers, and Mr. J. Crow in the show group.

The best bloom of a show Pansy came from Mr. A. Oller, and of a fancy Pansy from Mr. J. Paul.

The silver medal for twenty-four blooms of Violas, in as many varieties, was won by Mr. A. Oller; Mr. J. Crowe second.

AMATEURS.

For twenty-four fancy Pansies, in at least twelve varieties, Mr. A. Frater was first, winning the silver medal; Mr. E. Young and Mr. P. Braithwaite were second and third.

For eighteen blooms of fancy Pansies Mr. J. Sweeney was first, Mr. A. Frater and Mr. M. Maxwell following.

For twelve fancy Pansies Mr. J. Kirkwood won the silver medal, Mr. J. Sweeney was second, and Mr. J. Henderson third.

For six blooms of fancy Pansies Mr. J. Sweeney was first, and also for twenty-four blooms of show Pansies.

Mr. J. Kirkwood and Mr. J. Sweeney were first and second in the class for eighteen blooms of show Pansies; Mr. J. Kirkwood being first for twelve blooms of show Pansies; Mr. T. McGregor was second.

The silver medal for six sprays of Violas was won by Mr. C. K. McPhail; Mr. W. Knox and Mr. E. W. Brown were second and third respectively.

For twenty-four blooms of Violas, in six varieties, Mr. J. Johnson was first, and Mr. A. Frater second.

For twelve blooms of Violas, to be shown as Pansies, Messrs. A. Livingstone, E. W. Brown, and A. Frater were the winners in the order named.

For twenty-four blooms of Pinks Messrs. M. Campbell and Sons a good first, and Mr. A. Brown second.

Roses were delightfully shown by Messrs. D. Robertson and Co., Holensburgh, who carried all before them, Mr. J. Russell also exhibiting well. The last named had the finest bloom in the show.

The judges at the show were: For Pansies, Messrs. E. Sutherland, Kirkintilloch, B. Stewart and W. Storey of Lenzie, and J. Smellie, Busby; of the Violas, Messrs. M. Campbell of High Blantyre and Mr. J. Stewart of Rothesay; Mr. A. Gray, jun., judged the Roses.

ROYAL HORTICULTURAL SOCIETY.

THE meeting on Tuesday last was a very small one, but many interesting plants were shown.

FLORAL COMMITTEE.

Present: Mr. H. B. May (chairman), and Messrs. C. T. Drury, George Nicholson, W. Howe, J. Jennings, C. J. Salter, G. Rantke, C. Dixon, G. Gordon, C. E. Pearson, J. Fraser, W. J. James, J. A. Nix, C. E. Shea, E. H. Jenkins, and R. C. Notcutt.

One of the most effective groups was that from Messrs. R. and G. Cuthbert, Southgate, which was composed almost wholly of *Lilium speciosum album* and *Hydrangea paniculata grandiflora*. The *Liliums* were finely grown and well flowered, and the *Hydrangeas* chiefly as specimen standard plants carried many handsome trusses. Interspersed with Palms were many examples in flower of *Criminum Moorei*, while in the groundwork Ferns and *Ophiopogons* were noted. A large array of cut spikes of white *Phlox* *Paniceae* also figured in the foreground, thus making an effective as well as an imposing group. Silver-gilt Flora medal.

Cut shrubs in considerable force came from Messrs. J. Cheal and Sons, Crawley, and among them we noted several Oaks—*Quercus pedunculata nigra*, with blackish leaves; *Q. marmorata*, a freckled leaved Oak that grouped in company with the former would be most effective in the landscape; *Platanus Suttuerii* is also a finely variegated plant, the creamy and mottled leaves very striking. Other good things were *Lycocystis formosa*, *Spiraea Anthony Waterer*, *Ulmus Dampieri aurea*, *Prunus aconitifolia*, a marble-leaved plant, *Spiraea sempervirens*, *S. Fortunei alba*, *Potentilla fruticosa*, *Oleaster Hasseltii*, *Robinia semperflora*, *Buddleia variabilis*, together with *Bambusa*, *Acer* and other things. A series of Cactus, single and Pompon Dahlias were also shown by Messrs. Cheal. The Cactus sorts were chiefly seedlings and of quite a promising character. Silver Flora medal.

Messrs. Paul and Son, Old Nurseries, Cheshunt, had a small exhibit of cut Roses, in which *R. wichurana rubra*, *R. rugosa atropurpurea*, *Lady Battersea*, *Mrs. J. Laing*, *Duke of Edinburgh*, *Cheshunt Scarlet*, *Dawn*, a fine single pink, *Frau Karl Druschki*, *Perle d'Or*, *Eugene Lameach*, *White Lady*, *Liberty*, very good, *Louis van Houtte*, very dark, chiefly figured. A very interesting display. Silver medal.

Messrs. William Bull and Sons, Chelsea, contributed a fine group of *Dracena Victoria*, the half dozen plants handsomely coloured and especially well grown. In the background were arranged *Kentias*, and in the foreground *Licuala Mulleri*, a dwarf glossy leaved plant that should be of good service. Silver medal.

From Rothesay Messrs. Dobbie and Co. sent a brilliant lot of Poppies and Pentstemons, both groups rich and varied in their beautiful forms. In the former we noted *Pink Feathered*, a charming tone; the *Peony* flowered white and red striped, *Ranunculus* flowered rose, *scarlet* *Carnation* flowered, very showy; *Ranunculus* flowered white, very chaste and beautiful; *Ranunculus* flowered scarlet, a most brilliant flower; *Ranunculus* flowered crimson, a very dark sort; *Arenarium*, *scarlet* with black blotches; *Levigatum*, rich *scarlet* with intense circle of black; and the *Shirley* in many beautiful shades. In the *Pentstemons* we noted *Augusta Cain*, a crimson self to the innermost depths of the tube and quite a rarity in these flowers; *Talma*, white and *scarlet*; *Wm. Cuthbertson*, crimson and white; *Miss Willmott*, a *scarlet*-crimson shaded sort is also noteworthy in the self coloured varieties. In the lighter forms *James Logan*, *Ireland*, *Spitzberg*, and *La Prophete* are all good effective varieties. Silver medal.

The collection of *Nephrolepis* from Mr. H. B. May, Edmonton, contained some three dozen species and varieties, some of which were of great interest. We noted *N. exaltata plumosum*, a finely tasselled Fern; *N. Mayi*, an erect growing plant, with curved pinne; *Cordifolia crispata congesta*, a very small growing variety; *N. Piersoni*, a handsome

plant; *N. affinis*, *N. Bausei*, an elegant and pleasing plant of great beauty; *N. Duffii*, *N. cordifolia alata*, very fine; and *N. acuta*, being among the best. Groups of *Campanula Mayi*, *C. isophylla alba*, *C. gloriosa*, and *C. baichiniana* were also shown in company with *Oleander rosea splendens*. Silver-gilt medal.

Messrs. Cannell and Sons, Swanley, set up a large lot of Cacti and allied things, in which many fine examples were to be seen. For example, *Echinocactus Grusoni*, with golden spines horn-like in character; *E. Emoryi*; *Opuntia papyracantha*, a very remarkable species with nearly papery spines; *Echeveria metallica crispata*, very fine; *Echinocactus Wislizeni*; *E. viridescens*; *Pilocereus Drutwitschii*, very fine; and *Echeveria Hoveyi*, a curiously variegated plant. There were also many species of *Mammillaria*. *Aloe longiaristata* is a very distinct species. *Mesembryanthemum Bolusii*, a rare species, was here in several plants. The entire group was replete in choice and rare sorts. Silver-gilt medal.

Messrs. Veitch and Sons, Chelsea, set up a group of *Lantana salicifolia*, a small-leaved plant with lovely rosy heads of flowers, and three huge examples of *Senecio olivorum*, with golden-orange flower-heads. The latter is a fine plant for riverside or wild gardening.

Mr. R. Anker, Napier Road, Kensington, showed again small examples of Cacti and allied plants in considerable variety. The plants shown were quite small generally, and hardly give an idea of the established condition of the species.

Several seedling varieties of *Gladioli* were shown by Mr. W. C. Bull, Ellington Road, Ramsgate. One of these received the award of merit.

NEW PLANTS.

Nephrolepis Piersoni.—This is an American Fern of great beauty; indeed, it is one of the most handsome Ferns we have seen. The plants as shown presented a most attractive appearance. The fronds are nearly 2 feet long, bipinnate, the pinnae rising above the rachis in a very decided manner, and in the youthful stage flushed with a pale green shade that gives a very pleasing characteristic. The award of a first-class certificate was quite unanimous. The plant was shown by Mr. H. B. May, Edmonton.

Gladioli Ellington Bella.—A very handsome and showy variety, the spike well proportioned, and the flowers large, shapely, and of good substance. The colour is heavy cream throughout the tips of the segments, very lightly touched with scarlet lines about half an inch long. Shown by Mr. W. C. Bull, Ellington Road, Ramsgate. Award of merit.

ORCHID COMMITTEE.

As was generally expected Orchids were comparatively few in numbers, but they were of considerable interest.

Messrs. H. Low and Co., Bush Hill Park, Enfield, contributed a small group in which *Cattleya Eldorado* variety, *C. Mary Gratrix*, *Cypripedium kimballianum*, *C. niveum*, *C. rothschildianum superbiens*, and *C. rothschildianum* were conspicuous.

Messrs. T. Cripps and Son, Tunbridge Wells, sent a group of *Dia grandiflora*. The plants were splendidly grown and carried flowers of large size and brilliant colouring. The exhibit was admired by everyone.

Messrs. F. Sander and Sons, St. Albans, arranged the largest and most varied group of Orchids, and it was almost solely composed of *Cattleyas* and *Laelio-Cattleyas*, several being of striking beauty. Some of the best were *Cattleya Shakespeare*, *C. The Pearl*, *Laelio-Cattleya Martineii*, *L.-C. blechyleyensis*, three distinct forms, *L.-C. callistoglossa*, *L.-C. Henry Greenwood*, *Cypripedium conanthum superbum*, and *C. Tonso-Lawre*.

Mr. C. J. Salter, gardener to Mrs. Haywood, Woodhatch Lodge, Reigate, showed a chaste beautiful form of *Cattleya gaskelliana* named *delicata*.

Mr. W. H. Young, Orchid grower to Sir F. Wigan, Bart., Clare Lawn, East Sheen, exhibited *Cattleya Mrs. Pitt* and *Laelio-Cattleya Kathleen Gray*, both of which were very handsome.

Messrs. J. Veitch and Sons, Limited, Royal Exotic Nursery, Chelsea, sent *Cattleya atalanta superba*, *Sophr. Cattleya Saxa*, and *Laelio-Cattleya Issey*, each beautiful and distinct.

Mr. J. T. Barker, gardener to W. P. Burkinshaw, Esq., West Hill, Heston, staged *Laelio-Cattleya Ivernia*, and *Cattleya gigas* *White Queen*, both of which had suffered in travelling.

Mr. H. T. Pitt, Stamford Hill, sent a small exhibit. Mr. J. Davies, gardener to Mr. J. Gurney Fowler, Glebe-lands, South Woodford, sent a few Orchids, the most prominent of which was *Laelia digbyana-purpurata* King Edward VII. There were one or two other small exhibits.

FRUIT COMMITTEE.

A NEW PEACH.

There were two exhibits before the fruit committee. Mr. Will Taylor, Hampton Hill, sent a new Peach named *Libra*, which was raised from Alexander by the late Mr. R. D. Blackmore at Teddington. It is a large-fruited early variety, of attractive appearance, and good flavour. Award of merit. Dr. Bonavia, Worthing, sent *Grape Sultanieh*, the variety from which we get the Sultanias of commerce.

LEICESTER FLOWER SHOW.

THE annual flower show and gala was held in the Abbey Park, Leicester, on Tuesday and Wednesday last. Except for a heavy shower during the opening ceremony by the Mayor the weather on the first day was very favourable, and as we left the park thousands were wending their way there. The Abbey Park is a splendid place in which to hold the show, and when tired of the display in the tents visitors can admire the plants and flowers out of doors, for Mr. John Burn, who is superintendent

of the Leicester Parks, as well as secretary of the flower show, keeps the beds and borders most bright and full of interesting plants. The courtesy of Mr. Burn towards judges and other officials and his admirable arrangements for the convenient performance of their duties are proverbial, and we need only say that this year was no exception. The bad season somewhat affected the quality of the exhibits, particularly in the fruit classes. On the whole, these were not well contested. Mr. Goodacre was the most successful exhibitor of fruit. Roses were very good, cut flowers were a fine feature, and vegetables also were very well shown.

PLANTS.

Group of plants (160 feet area): First, Messrs. Cypher and Son, Cheltenham, with a very bright and prettily arranged group; second, Mr. Thompson, Littleover House near Derby, with a very good group, though somewhat heavy; third, Mr. William Finch, Coventry; fourth, Messrs. Artindale and Sons, Sheffield.

Six stove and greenhouse plants: First, Mr. William Finch, Coventry.

Best plant in bloom: First, Mr. William Finch, Coventry, with Bougainvillea.

ROSES (OPEN).

Thirty-six blooms: First, Messrs. Alex. Dickson and Sons, Newtownards, with a lovely lot. George Dickson was a magnificent bloom, Mrs. Edward Mawley, Ulster, and Duchess of Westminster were perhaps the pick; Messrs. D. and W. Croll, Dundee, were second with good blooms also, Frau Karl Druschki was a splendid bloom; third, Messrs. R. Harkness and Co., Hitchin.

Messrs. Alex. Dickson and Sons were again first for twenty-four blooms: Mildred Grant, Beale Brown, and Mrs. John Laing were very good; second, Mr. Barrow, Leicester; third, Messrs. R. Harkness and Co., Hitchin.

Messrs. Alex. Dickson won for twelve Teas or Noisettes. Mrs. Jules Graveraux was a good bloom; second, Messrs. D. and W. Croll, Dundee; third, Messrs. R. Harkness and Co., Hitchin.

Twelve Roses (one variety): First, Messrs. Alex. Dickson and Sons, with splendid Mildred Grant; second, Messrs. Croll, with Mrs. W. J. Grant; third, Messrs. Jarman and Co., Chard, with Mrs. J. Laing.

The best Rose in the show was a bloom of Frau Karl Druschki, from Messrs. D. and W. Croll, Dundee.

Twelve Teas (one variety): First, Messrs. Dickson, with Mrs. Edward Mawley; second, Messrs. Croll, with the same variety; third, Messrs. R. Harkness, with White Maman Cochet.

AMATEURS AND GENTLEMEN'S GARDENERS.

Twenty-four Roses: First, Mr. W. Boyes, Derby, with some good blooms; a good second, the Rev. J. H. Pemberton.

Eighteen Roses: First, Mr. Whittle, Belgrave Avenue, Leicester, with finely-formed blooms; second, Mr. R. Foley Hobbs, Worcester; third, the Rev. J. H. Pemberton.

Twelve Roses: First, Mr. R. Foley Hobbs; second, Mr. Whittle, Leicester; third, Rev. J. H. Pemberton.

Six Roses (one variety): First, Mr. H. V. Machin, Worksop, with White Maman Cochet; second, Mr. Richard Park, Bedale; third, Rev. J. H. Pemberton.

Six Teas: First, Mr. R. Park; second, Mr. R. Foley Hobbs; third, Mr. H. V. Machin.

AMATEURS.

Twelve Roses: First, Mr. W. Upton; Mrs. W. J. Grant was a good bloom; second, Mr. M. Whittle; third, Mr. T. Warner.

Eighteen Roses: First, Mr. M. Whittle, Leicester, with fairly good blooms; second, Mr. W. Upton.

Six Teas (one variety): First, Mr. W. Upton; second, Mr. T. Warner, with Maman Cochet.

Six Teas: First, Mr. W. Upton; second, Mr. M. Whittle, Leicester; third, Mr. T. Warner.

Six Roses: First, Mr. J. Mayes; second, Mr. M. Whittle; third, Mr. W. Upton.

HARDY FLOWERS (OPEN)

Twelve bunches hardy annuals: First, Mr. F. J. Clark, Wistow Hall Gardens; the Shirley Popples were splendid; second, Messrs. Jarman and Co., Chard; third, Mr. H. Hill, Lyston.

Twelve bunches stove or greenhouse flowers: First, Mr. H. Blackway, Dunmore Gardens, Rugby, with a very bright collection.

Twenty-four tuberous Begonias, double blooms: First, Messrs. Blackmore and Langdon; second, Messrs. Jarman and Co., Chard.

Twenty-four tuberous Begonias, single: First, Messrs. Blackmore and Langdon; second, Mr. Charles Burditt, Great Burdon.

Twelve yellow ground Carnations: First, Mr. R. G. Rudd, Cotteridge, with some very good blooms; second, Messrs. Thomson and Co., Birmingham; third, Mr. A. R. Brown, Handsworth.

Twelve Picotees, white ground: First, Messrs. Thomson and Co., Birmingham; second, Mr. A. R. Brown, Handsworth; third, Mr. W. Baraby.

Twelve Carnations, flakes and bizarres: First, Messrs. Thomson and Co., Birmingham, with a very attractive lot; second, Mr. A. R. Brown, Handsworth.

Twelve Carnations (selfs): First, Mr. R. G. Rudd, Cotteridge, with splendid flowers; second, Messrs. Thomson and Co., Birmingham; third, Mr. A. R. Brown.

FRUIT.

Eight dishes of fruit: Mr. J. Goodacre, Elvaston Castle Gardens, was first with good Madresfield Court and Black Hamburg Grapes, brown Turkey Figs, and Harrington Peach as the best. Mr. J. Read, Bretby Park Gardens, was

second with dishes of small fruits; and Mr. Swanwick, Nottingham, was third.

Best collection (eight distinct kinds): First, Mr. Goodacre with Apple Lady Sudeley, Pear Dr. Jules Guyot, Black Hamburg Grape, and a seedling Melon as the best; Mr. J. Read was second. There were no more entries.

Collection of Grapes (six varieties): First, Mr. Goodacre, with very good Madresfield Court, Black Hamburg, and Muscat Hamburg; second, Mr. J. Read, with Madresfield Court as his best. No more entries.

Mr. Goodacre was given second prize for one Pine-apple. He was the only exhibitor, and showed a small Queen Pine.

Two bunches Black Hamburg: First, Mr. Goodacre, with very good well-coloured bunches; second, Mr. J. Swanwick, Nottingham; third, Mr. G. Underwood, Aylestone Park.

Two bunches Muscat of Alexandria: First, Mr. Goodacre, with fairly good bunches; second, Mr. W. Duncan, Bosworth Hall Gardens, Rugby; third, Mr. Swanwick.

Two bunches black Grapes (Black Hamburg excluded): First, Mr. Goodacre, with Muscat Hamburg; second, Mr. W. Duncan; third, Mr. Swanwick.

Two bunches white Grapes (Muscat of Alexandria excluded): First, Mr. W. Chamberlain, Ansty Pastures, with Foster's Seedling; second, Mr. W. Duncan; third, Mr. J. Goodacre.

Six Peaches: First, Mr. H. Blackway, Dunmore Gardens, Rugby, with a good dish (unnamed); second, Mr. Goodacre, with Raymaekers; third, Mr. J. Swanwick.

Six Nectarines: First, Mr. H. Blackway; second, Mr. J. Goodacre; third, Mr. J. Read.

One Melon (green flesh): First, Mr. J. Swanwick, with Sutton's Perfection; second, Mr. F. J. Clark, Wistow Hall Gardens; third, Mr. J. Read.

One Melon (scarlet flesh): First, Mr. F. J. Clark, with Lord Derby; second, Mr. J. Swanwick; third, Mr. W. Duncan.

Dish of Cherries: First, Mr. Goodacre, with Black Circassian. No more entries. Mr. Goodacre was also first for Morellos.

Mr. S. H. Clarke, Aylestone, was first for a dish of Gooseberries.

Six dessert Apples: First, Mr. Goodacre, with Lady Sudeley. Mr. Goodacre was also first for a dish of Plums, showing Kirke's; Mr. J. Read was second.

Mr. John Hudson was first for a dish of Tomatoes.

Collection of vegetables: First, Mr. John Hudson with an excellent lot; a good second, Mr. J. Read; third, Mr. R. Hoe.

TRADE EXHIBITS.

Mr. H. Deverill, Banbury, showed zonal Pelargoniums and hardy flowers in variety.

Mr. W. L. Pattison, Cherry Orchard, Shrewsbury, sent Violas in many pretty varieties, cut Roses with other flowers.

Mr. Charles Holden, Butt Lane, Hinckley, showed Sweet Peas in many good sorts.

Mr. W. B. Child, Acock's Green, Worcestershire, had a very good display of hardy flowers.

Messrs. Harrison and Sons, Leicester, showed some excellent Sweet Peas, hardy flowers and plants in pots.

Messrs. W. and J. Brown, Peterborough and Grantham, showed Pelargoniums, Verbenas, hardy flowers, and many cut blooms of Carnations.

Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, had some very fine tuberous Begonia blooms, both double and single.

Mr. F. Bradley, Peterborough, exhibited Carnations made up in various designs, also single blooms of Carnations, Sweet Peas in bunches, &c.

Mr. W. Bentley, Leicester, showed Roses in vases in capital condition, the blooms were fresh and very attractive.

Mr. J. Barron, Leicester, showed Roses in vases.

Mr. Carnall, London Road, Leicester, exhibited a display of floral designs, Ferns, and Palms.

Mr. Charles Warner, Leicester Abbey, had a beautiful lot of Roses in vases.

The Ranelagh Nurseries Company, Leamington, showed the best Asparagus myriocladus.

Mr. E. Harris, Aylestone Park, Leicester, showed Roses.

Mr. Robert Sydenham offered prizes for the best collection of Sweet Peas.

Flowers at the Drill Hall.—A correspondent writes: "It is worthy of note, I think, that at the meeting of the Royal Horticultural Society on Tuesday last not a single group of hardy flowers was staged. I know of no parallel to this in the month of August, when hardy flowers are so plentiful."

Royal Horticultural Society—Exhibition of British-grown fruit and vegetables.—The above society will hold an exhibition of British-grown fruits and vegetables at Chiswick, on September 29, 30, and October 1. The prize schedule is now ready, and contains, in addition to the list of prizes, an authoritative list of dessert and culinary Apples, Pears, and Plums. Special prizes are offered for preserved and bottled fruits. A conference on vegetables will be held on Tuesday, September 29, at 2.30 p.m., Mr. G. Bunyard, V.M.H., in the chair. The following gentlemen have been asked to read papers on—1, "Cooking Vegetables," Dr. Bonavia and Mr. James Hudson, V.M.H.; 2, "Vegetables all the year round for a private family," Mr. W. H. Divers; 3, "Vegetables for Exhibition," Mr. Edwin Beckett; 4, "Vegetables for Market," Mr. W. Poupart. Any contributions to the conference

will be welcomed. Donations towards the prize fund will be gratefully received by the secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W., of whom copies of the schedule can be obtained. Applicants should enclose a stamped envelope ready addressed to themselves.

The Broughton Castle Cottage and Amateur Gardening competition.—We are very pleased to hear that "The Cottage Garden and Amateur Horticultural Competition" for the counties of Oxfordshire, Northamptonshire, and Warwickshire, held on Bank Holiday last at Broughton Castle, was a great success. Lady Algernon Gordon-Lennox must be congratulated on her praiseworthy efforts to promote a healthy and profitable pastime.

Still they come.—America is happy in having a Peony society. We have not reached this dignity yet, but a correspondent unkindly remarks that he proposes to start a society for the promotion of fragrant Onions. It is really too bad of America to encourage these special societies. We are apt to copy the example.

The Lady Margaret Hall Settlement.—We have received the yearly report of this settlement, which is doing good work in co-operation with parochial and other organisations in North Lambeth and Vauxhall. The settlement is in Kennington Road. It has a strip of garden ground at the back, which has proved a source of much comfort and healthful enjoyment to a number of invalid children. The report makes grateful acknowledgment of a brief notice of the settlement's work that appeared last year in THE GARDEN, and that was the means of bringing it a substantial donation. Personal help is also wanted, as may be seen from the following quotation from the report. We are glad to know that our notice was of some avail, and trust that these few words may be a further means of help to this admirable organisation. "The borders are fairly full of flowers that have been given from time to time; but, alas! they are also full of weeds, and none of the residents have the time to clear these latter away. It is hard to believe that there are not many people who would like to devote some time to help us to keep the garden in order, as it is really extraordinarily nice when we remember that it is situated in Lambeth. Any offers of help of this kind will be most joyfully received."

Newbury Horticultural Society.—The good people of Newbury (Berks) were fortunate as regards the weather for their excellent show held on Bank Holiday, and few towns have a better show-ground than Goldwell Park, a lovely spot on rising ground overlooking the town. This society was established in 1848, so that it has held its own, and this year's display was worthy of the town and district. In few towns are flower shows so well supported by the tradesmen and others from the surrounding country and district; it is quite refreshing to see such enthusiasm and competition in the amateurs' and cottagers' classes, which in this section of the show is very keen indeed. For a country show the attendance was very large. I note that last year on a wet day over £200 was taken at the gates. I hope to note the principal features of this show next week, as a few things, such as cut flowers and fruit, were very fine indeed. The president for the year is always the Mayor of Newbury, and he is ably supported by a good committee and hard working secretaries. —W.

Plants in New Zealand.—Mr. Hunt, who gave the interesting lecture on "Horticulture in New Zealand" at the meeting of the Royal Horticultural Society on the 21st ult., writes to correct a sentence which conveys a wrong impression. The lecturer said: "Many of the plants most commonly grown in England are quite at home in New Zealand, and live outdoors through the winter months, except in the southern parts of the South Island, where it is too cold for them. I might add that throughout New Zealand home favourites, such as Pelargoniums, Fuchsias, and Heliotropes, thrive well, and it is only in very severe winters in the south that the frost injures them to such an extent as to cause the death of the plants."

CARSON'S PLASTINE.

A PLASTIC, DURABLE, GLAZING COMPOSITION.

Withstands exposure to heat and moisture on Forcing Houses, Conservatories, Frames, etc. Supersedes Genuine Linseed Oil Putty.
SOLD IN KEGS, 28lbs., 56lbs., and 112lbs. each. Price 16s. per cwt. 2 cwt. and upwards delivered carriage paid.

"VITROLITE."

A PAINT SPECIALLY PREPARED FOR HORTICULTURAL WORK.

Durable, Elastic, will not Flake or Scale, Dries with an Enamel Surface.

WHITE, AND STONE COLOUR, 7s. 6d. per gallon. Mixed ready for use. 8 gallons and upwards delivered free.

FULL PARTICULARS SENT ON APPLICATION.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance, no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 80, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—C. E. B.—*Trachelium caeruleum*.—Mrs. Taylor.—*Rose Safrano*.—E.—The *Lavatera* is *L. Olbia*, good form; the *Linaria* is *L. pallida*; and the *Sedum* is *S. roseum* var. *linifolium*.—H. H. P.—1, *Malva moschata* (the Musk Mallow); 2, *Sedum oppositifolium*; pink-flowered *Sedum* is *S. spurium*; intense violet or Royal purple flower is *Tradescantia virginica atrovirens*; the light blue is *Polemonium Richardsonii*; 7, *Crambe cordifolia*; 8, *Lythrum thyrsiflora*; 9, *Lythrum roseum superbum*; 10, *L. Salicaria*. The scarlet flower is *Monarda didyma*, and the *Veronica* is *V. virginica* var. It is unfortunate that you used marginal stamp waste to affix to the specimens, as this, when in contact with damp moss, is almost immediately released. Most of the numbers were detached and mixed with the packing. Some things are named to colour, the others we were unable to deal with. Small tickets securely attached with numbers are perhaps the best. You can plant all the things named in the autumn.—A. H.—The pink flower is *Erigeron philadelphicus*; the yellow one *Sibthorpia peregina*; the other plant was over. Will you kindly number the specimens in future.

Tulips lifting (Mrs. WEDGWOOD).—These are best if lifted and rested each year, and the work should be taken in hand without delay. As the plants have now lost their leafage, all you have to do, provided they are named species or varieties, will be to lift and keep them separate. You will find large pots a convenience, first placing in the label and then digging up the bulbs. Place these also in the same pot until that sort is finished. Place the pot on one side and so continue till all are lifted. Finally take the bulbs to a shed or outhouse, where removed from the sun the bulbs may be laid out thinly in shallow boxes to finally dry off. For a fortnight they would be quite safe in the pots as lifted in any open shed where no sun could reach the roots. Having spread out the bulbs and dried them well they are ready for cleaning at any convenient

moment when the small may be separated from the large or flowering roots. Beyond this you have merely to keep them dry and well aired till required again in October for planting. In the latter case you should avoid the same spot where the roots came from, as by selecting a fresh place or position and one well tilled a greater success should follow.

Rose leaf spot (Mrs. ARTHUR LONGMAN).—Your Roses are apparently suffering from the above fungus. Your best plan would be to replant the beds this autumn, and discard such varieties as seem specially affected now. A spraying with copper solution would be beneficial if applied at once. The recipe is as follows: carbonate of copper, 1 oz., and carbonate of ammonia, 5 oz.; mix these together in a quart of hot water, and then add 16 gallons of water. Apply this with an Abol syringe at intervals of a few days. Three or four applications should keep the fungus in check.

TRADE NOTE.

GARDEN ORNAMENTS.

In the embellishment of gardens, fountains, vases, and other ornaments play an important part, and as their design, good workmanship, and arrangement are proportionately good or bad, so will the garden lose or gain by their presence. It is

important to have numerous good and various designs in order to be able to make a good selection, as one position and its environment will need quite different garden ornaments to another. By having a number to choose from

selection is made easier, and is likely to prove more satisfactory, therefore we advise a perusal of Messrs. Handyside's list. Fountains and vases may be carved in marble or stone, moulded in terra-cotta and stucco, or cast in iron or bronze. The finest works are those carved in marble by skilled artists, but the very great cost which is involved renders their use rare. Stone, though not so expensive a material as marble, cannot be sculptured well without considerable cost, but fountains and other similar objects are sometimes made at a comparatively low price by unskilled men. Fountains are seldom made of terra-cotta, and vases of this material are easily chipped and broken; they both will crack and crumble away when exposed to wet or frost. The art of casting ornamental objects in metal is an old one, and Messrs. A. Handyside and Co., Limited, Britannia Ironworks, Derby, have one of the oldest foundries for this purpose in England. The use of cast iron or bronze permits a sharpness and delicacy of outline which is impossible in stone or stucco. The fine moulding sand obtained at Derby allows a smoothness of surface not otherwise easily obtainable. Cast iron fountains and vases if occasionally painted are imperishable, and will not crack when exposed to wet or frosty weather. Messrs. Handyside issue no less than seven catalogues, handsomely illustrated, with ornamental designs in ironwork for many and varied uses. Among them may be mentioned gates, railings, vases, pedestals, fountains, porticoes, &c. They are so complete that no one contemplating the erection of ornamental ironwork of any description should fail to obtain them.

CATALOGUES RECEIVED.

Carnations, Picotees, and Auriculas.—Mr. James Douglas, Edenside, Great Bookham.

Japanese Lily Bulbs, Seeds, &c.—Messrs. L. Boehmer and Co., Yokohama, Japan.

Strawberries.—Messrs. George Bunyard and Co., Royal Nurseries, Maidstone.

Bulbs for Early Forcing.—Herd Brothers, Penrith.

General Nursery Stock.—Mr. William Wiseman, the Nurseries, Forres, N.B.

Daffodils and Carnations.—Mr. James Douglas, Edenside, Great Bookham, Surrey.

Alpine Plants.—M. A. Gédre, Luz, Hautes-Pyrénées.

Bulbs.—Messrs. Dobie and Mason, 22, Oak Street, Manchester; B. S. Williams and Son, Upper Holloway, N.; John Peed and Son, West Norwood, S.E.; David W. Thomson, 113, George Street, Edinburgh.

THE GARDEN

No. 1656.—VOL. LXIV.]

[AUGUST 15, 1903.]

GIFT OF A GARDEN TO THE ROYAL HORTICULTURAL SOCIETY.

IT will interest, we are sure, every reader of *THE GARDEN* to know that Sir Thomas Hanbury, K.C.V.O., whose beautiful garden at La Mortola, Italy, is world-famous, has purchased Oakwood, Wisley, the experimental garden of the late Mr. G. F. Wilson, and presented it to the Royal Horticultural Society. It is a thoughtful gift. The estate is 59½ acres in extent, and, as a description of it on another page shows, a large portion of it is filled with the flowers that the late Mr. Wilson delighted to grow, and he would have desired no better future for a garden in which he spent many years of a useful and interesting life.

The estate is in lovely Surrey woodland. The garden is simply a clearing in Pine and Birch, but the surrounding acres comprise both meadow and arable land, in which the great practical work of the society can go forward with renewed energy and success, and free from the hopeless work of attempting experiments and trials in a London suburb. We are thankful for this great gift. The society has passed through a period of some anxiety to those who ventured to think, though we have never believed that such a catastrophe would occur, that the new Hall would destroy all the great work for which the society was founded. Sir Thomas Hanbury's gift has set those anxieties at rest, and in a new garden in a beautiful country the practical work of the society will be henceforth pursued.

We are sorry the days of the Chiswick Gardens are numbered. A sentimental interest clings to the old place, but of course sentiment must be brushed aside when we contemplate the horticultural needs of the age, though the splendid work of the past fifty years in these historic gardens can never be effaced. There the late Mr. Barron devoted his life to trials of flowers, fruits, and vegetables, rendered in some degrees useless through their present environment. The council of the society has, though hampered with an ugly hall, steadfastly adhered to the desire of acquiring a new garden as quickly as possible; but of course it was not wise to run two expensive schemes at the same time. It is a matter for hearty congratulation that they have been relieved of a financial burden in the future through this unexpected gift

from one whose love for horticulture is shown in his interesting garden at La Mortola. Horticulture is, though unassisted by any State aid, a great and increasing industry. It concerns our national life, and in these acres many of the garden products of the future will be tested, and experiments conducted to improve existing races and create new varieties and hybrids.

We are not aware that the trade growers of this country make merriment over the practical work of the society. It is news to us, and we can only think the utterance of our excellent contemporary the *Gardeners' Chronicle* was made in jest, when it avowed that the trade laughed at the endeavours of the society to have independent trials of flowers and vegetables. These are conducted by practical men, and the results judged by two committees which are composed of honoured names in the world of horticulture. Of course the trials at Chiswick are not wholly satisfactory, but that is the fault of position, and perhaps inadequate space and labour. With nearly sixty acres, much of which is thoroughly good soil, the society will again have its experiments conducted in a way to win the confidence of the many trade growers and amateurs who in the past have been accustomed to send their novelties or selections to Chiswick for the sake of comparison or as a test of their true worth.

The trials are thoroughly independent. No matter who the sender may be, if the subjects lack merit they receive no award, and when a flower or a vegetable does gain the hall-mark of genuine worth it is cherished, not only by the British people, but all over the world. The committees comprise some of the best experts the horticultural world can furnish, and long association with these committees has given them a special knowledge. We hold no brief for the Royal Horticultural Society. Its officers have blundered on many occasions, and will continue to do so; it is the price that is paid for the frailty of human nature, but no one can accuse the present council of not possessing an enthusiastic love for horticulture and the splendid society they represent.

The new "Chiswick" should be in the present century what the old gardens were to the century that has passed, and for enabling the society to continue its grand work we have to thank Sir Thomas Hanbury. We hope the example that has been set will be followed by those who wish to help the council in keeping up the gardens, laying out portions of

it that are now meadow land, and in building the necessary houses. It is the wish of the giver that the gardens should contain collections of trees and shrubs, and to thoroughly reflect many aspects of horticulture, and excellent material is already there as a beginning.

Wisley is, unfortunately, not very accessible, but will probably in the near future, through the means of a light railway along the Portsmouth road, be brought within easy reach. It is bounded by a beautiful common on one side, and Lord Lovelace's estate on the other, so that whatever happens it is safe from the inroads of the town.

Though Weybridge is not the nearest station, it is the most quickly reached from Waterloo. There are plenty of cabs at the station, and the drive of six miles is through a part of the loveliest of Surrey scenery. Ripley is about three miles away, but Weybridge was the station always recommended by the late Mr. Wilson.

All well-wishers of the society will rejoice that its great work has received encouragement so practical and stimulating, and the Council and Fellows are to be congratulated that next year not only will it possess a new Hall—which we may remind those who have not subscribed that there is nothing to prevent them so doing—but a beautiful garden filled with trees, shrubs, and flowers, and, in part, fruit trees also. It must be adapted to present needs, and probably those who have desired a garden instead of a hall will be asked to subscribe for its upkeep, but of that we shall give details we hope next week, with a rough plan showing its position more clearly than can be expressed in words.

EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

CAMPANULA VIDALI.

Mr. Dixon sends from Astle Hall, Chelford, Cheshire, flowers of this interesting *Campanula*. With the following note: "I have it flowering in the greenhouse, where it does very well, some plants

having seven or eight stems of flowers. I tried it some years ago on the rockwork, and although I flowered it there it was very uncertain, and would not stand a hard winter. It is quite a show in my greenhouse now. I have a good many plants all in full flower." The flowers sent show how well the plant is grown by our correspondent.

FLOWERS FROM CORNWALL.

"W. D. P." sends from Cornwall several interesting flowers, the most important being a bunch of

SINGLE MULE PINKS

of a wonderful crimson colour, almost blood red, and so rich and beautiful that we hope the sender will keep this selection pure and constant. Our correspondent says they are "very free flowering and bright border plants. I send two varieties. I had the original plants flowering for three seasons. They strike freely, but do not seed."

PRIMULA CAPITATA

was very fine, the flower-heads large, and on strong stems; and also sent was

INULA ROYLEANA.

"A new one. It has a fine leaf and a large flower, but, like some other Inulas, it is rather coarse." There are many half-wild places in which this noble orange flower can be used. It is welcome for its bold growth and fine leaf and flower.

ANNUAL SCABIOUS.

Mr. Verrald, Sunnyside, College Road, Harrow, sends a delightful gathering of Scabious flowers in rich colourings, warm crimsons, deep purples, and many other shades, with the following letter: "I hope you will accept a few Scabious flowers grown

by a gardening student. They have been much admired for their size and colouring, and were grown in poor garden soil which has never been manured in any way. I sowed the seed last August in the open (they were only 1d. packets), and planted out the seedlings in November, pinching them at the same time. In June each seedling was a large bush covered with hundreds of buds. I have been cutting since then and shall until the frost comes. I hope Scabious are not too commonplace for the Editor's table, but I see that all sorts of plants may be sent. I am only a student at present, but THE GARDEN is my favourite paper and always will be, being very helpful and instructive; it is neither 'amateurish' nor too technical."

THE NEW GARDEN OF THE ROYAL HORTICULTURAL SOCIETY.—OAKWOOD, WISLEY, SURREY.

SPLENDID GIFT FROM SIR THOMAS HANBURY, K.C.V.O.

ABOUT twenty-three years ago the late Mr. G. F. Wilson established at Wisley, which is approached by a drive of six miles from Weybridge, through beautiful scenery of Pine, hill, and meadow, what he called an "experimental" garden. That garden is now the property, through the munificence of Sir Thomas Hanbury, of the Royal Horticultural Society, which the late possessor so warmly supported and instituted, it may be interesting to recall, the guinea fellowship. Mr. Wilson

called his garden Oakwood; it is a clearing in woodland, and, as we mention in our leading article, comprises 59½ acres, with the cottage on the hilltop looking towards the blue distance of Pine woods. The garden is undulating, and a home of flowers planted in the positions they love best—here the Hellebore clothing the sides of a damp ditch, there Mr. Wilson's famous Lilies sheltered by surrounding shrubs from the winds of spring.

The story of the year is unfolded as the seasons pass by. When the Snowdrop ventures forth its flowers there are already signs of the awakening of Primrose, Auricula, Hepatica, and the early blossoms of the year to take their part with the last of the Hellebores in making groups of colour in the garden.

A garden of this nature is an object-lesson to those who wish to tread the fragrant paths of horticulture. The plants were studied individually, so that they enjoyed similar conditions to those surrounding their native haunts, and this is surely the keynote to success in gardening—the flower and the fruit must be studied.

When we last visited Oakwood, to spend one of those happy days with Mr. Wilson, we well remember the Japanese Iris was in flower, and probably in this garden alone is this Iris grown in a way so delightful. Mr. Wilson possessed thousands of plants and as many seedlings; they were reminiscent of the Iris-lined streams in the gardens of Japan. Two ditches wind about in this part. The first one is planted with Irises, and when the flowers are in beauty it is a quaint scene. The flowers

SUMMER TIME AT OAKWOOD, WISLEY, NOW THE NEW GARDEN OF THE ROYAL HORTICULTURAL SOCIETY.

peer up above the grassy leafage and bespatter the garden with a mosaic colouring, here a patch of purple, there white, and near to it perhaps a colouring of warm rose. There is much water in the ditches in winter, but this, of course, the Japanese Iris enjoys.

The charm of a garden is not in its blaze of colour at one season, but a succession of flowers to girdle the year. When the Japanese Irises are over, Harebells and other plants flower on the banks. One ditch is wider than the other, and in this lush retreat the flowers have become in a sense naturalised. It may interest our readers to know that Mr. Wilson used to save the Iris seeds in this garden, and sow them during the last week in March, keeping them in the pods until that time.

By the lake side there are Irises, too, and it is almost impossible to go to one spot in this garden of many plants and declare that to be the most picturesque and interesting. Wherever one turns, brushing through the Rhododendrons or treading in shady grass paths lined with *Linnaea borealis*, there is something to interest. On pond and ditch sides Roses pour forth their rich fragrance, Crimson Ramblers tumbling about in wild profusion, and one pond is covered with the yellow *Villarsia* with a fringing of *Loose-strife*. Hybrid Water Lilies float on the surface of the little lake, with *Gunnera manicata* and *G. scabra* on the sides, and in one corner is a dense group of *Saxifraga peltata*.

Shade and sunshine gladden the garden. The sun scores the grassy paths and glints across cool walks of hardy Ferns. One little path, losing itself amidst the luxuriant shrubs, is covered with the strong white *Pratia angulata*, a mossy carpet as pretty as the little *Arenaria balearica* that stains many a rock surface with green.

We know not when Oakwood is in its brightest dress. It is a place to revel in when the blue Primroses raised by the late Mr. Wilson make bits of colour against mossy stones, and the *Auriculas* saturate the air with their scent; but the time when the Japanese Irises are in full beauty, with the opening of the Lilies, is to us a season of perhaps greatest enjoyment. Recently several standards of the old garden Rose *Aimee Vibert* were bent with their fragrant burden, and a Crimson Rambler had flung itself over an arch and mounted into a tree near. In Gentian time it is worth a journey to see the *Gentianella* (*G. acaulis*), a carpet of blue. There were—and we understand that the garden has been disturbed very little since Mr. Wilson's death—120 yards, 50 yards of plants resulting from seed collected by Mr. Wilson's son, Mr. Scott Wilson, on the Alps. Of course, the *Gentianella* we know best is the deep blue, but the plant varies from seed. Some forms are quite approaching to white. *G. ornata*, *G. septemfida*, and *G. asclepiadea* are quite a success.

The first Japanese Rose hedge planted in this country is at Oakwood, and a few years ago Mr. Wilson made a new feature on the hillside near the lake by planting there all the finer shrubs, with groups of Lilies sheltering between them. This as the years go on will mature and prove a Lily and shrub garden of rare charm.

Oakwood at present is a woodland garden. Heaths of many kinds make thick carpets of growth, and, with Camellias and Azaleas, revel in the vegetable soil. A strong bush of Bog Myrtle distils its sweetness when brushed against, and in a moist and shady corner *Shortia* and *Schizocodon* are quite happy, plants that are a sore trial to those who do not quite know the treatment to give them.

Adiantum pedatum was spreading freely in the shade, and *Erythroniums* too, but one of the great features of the place is the Lily.

The late Mr. Wilson was one of the first to bring this beautiful family into prominence. For about twenty years Lilies have been grown at Oakwood, and we have learnt many lessons there of the way to manage individual kinds. This enthusiasm deepened with years, and we well remember Mr. Wilson once pointing out to us with pride *Lilium szovitsianum* in flower under an Apple tree from seed sown there. In the same colony were seedlings of *L. Martagon*, *L. dalmaticum*, and *L. Catansei*. *L. Humboldtii* was growing out of a bed carpeted with *Linnaea*, and in other places *L. pardalinum*, *L. longiflorum*, *L. giganteum* among the Rhododendrons, and *L. auratum* were noteworthy. *L. auratum* was in a clearing in the wood, and groups of it had been undisturbed for ten years. So much could be written of the garden and its plants that it is unsatisfactory to close the story, knowing that many things have not been mentioned in these necessarily short notes.

It is a matter of thankfulness that it is preserved for ever for the Royal Horticultural Society to pursue sound horticultural work on the broadest lines.

Sir Trevor Lawrence, Bart., president of the society, writes as follows to the *Times* of Tuesday last:—

"I am authorised by Sir Thomas Hanbury, K.C.V.O., whose garden at La Mortola has a world-wide fame, to ask you to let me make public through your columns what I can only describe as a signal mark of characteristic generosity. Sir Thomas has purchased for presentation to this society the estate and garden of the late Mr. G. F. Wilson, F.R.S., at Wisley, near Woking.

"Mr. Wilson's garden has long been celebrated, and the skill and success with which hardy plants have been cultivated there for many years show how suitable it is for the purposes for which it has been selected by Sir Thomas Hanbury. The total area of the estate is sixty acres, part of which is used for agricultural purposes. There is a small residence, farmhouse, and other suitable buildings on it. The garden has the variety of soil and aspect and the unfailing water supply which are essential for the purposes of the Royal Horticultural Society, which will have but little to do but provide the necessary plant houses.

"The Fellows of the society owe a heavy debt of gratitude to Sir Thomas Hanbury for his

SIR THOMAS HANBURY, K.C.V.O., OF LA MORTOLA, ITALY.

thoughtful and generous gift. All lovers of gardens will gladly know that Mr. Wilson's garden has been rescued from the fate which often overtakes such pleasaunces when their creator passes away.

"Now that the Royal Horticultural Society has received this gift, there is every reason to hope that its centennial year, 1904, will see it provided with a new garden, as well as, thanks in a large measure to Baron Henry Schröder, with a new metropolitan hall and offices."

NOTES OF THE WEEK.

August 18.—Royal Horticultural Society's Committee meet.

The Loganberry.—Although Messrs. Veitch and Sons have secured for this remarkable hybrid, if such it really is, the highest honour the fruit committee of the Royal Horticultural Society can bestow, viz., a first-class certificate, yet it is to be hoped that we shall often see fruits of it placed before the committee, as it is not yet known whether they have been at their very best or with the highest flavour. Those staged by Messrs. Veitch from Langley were certainly very fine. One example seen on the 21st ult. showed that such fruits must not be sent by post. But as this Loganberry is a most valuable addition to our hardy fruits, and should in time be found as common as the Raspberry, and in every garden, is it too much to ask if Mr. Logan of the United States,

the reputed raiser, does not merit some recognition at the hands of the Royal Horticultural Society? Would not that body do itself honour in inviting Judge Logan to accept at its hands a Hogg medal?—A. D.

Lavatera Olbia.—This makes such a fine bush on a sunny bank that it deserves to be more generally grown.—W.

The Floral and Fruit Committees' Cricket Match (Royal Horticultural Society) will not take place. It was to have been played at Holland Park, but we think a Saturday was an unfortunate day to fix.

Cactus viviparus.—This is one of the first of the hardy Cacti to flower here, and deserves special note on account of its colour being an uncommon one amongst this class of plants, its hardness and rarity. The flower is of a most intense purple-crimson, and of a good size. It is essentially a rock plant on account of its dwarfness and requirements. In common with the hardy Opuntias and other Cacti, *C. viviparus* will succeed well in a well-drained soil consisting of

of some advantage to traders. Fruit growers could, for example, join together and send by the railways larger quantities of produce at lower rates than for smaller quantities. If anyone could show his board that any railway company in this country was granting a preference to the foreigner over any other trader, his board would take the matter up and do everything they could to see that that illegal act no longer took place. There was nothing like competition to stimulate railway companies, and if the farmers and other traders could bring about competition by motor-car, for instance, they would soon have reduced railway rates. His desire as president of the Board of Agriculture was to help them as much as possible in that direction.

A note from Lechlade, Gloucester. In answer to an enquiry in THE GARDEN about *Ipomœa cœrulea*, I planted it two years ago in the open ground. It grew to a great size, but did not flower well. This year I am growing it in Seakale pots against the west side of my house. It has flowered a little, and is now covered with buds.

not do anywhere. I have tried peat and loam, in sun and in shade, wet places and dry; I believe they do not like hard water. The Roses I planted last autumn have not done well, though the older plants flowered magnificently in July. I pruned, fortunately, very late this year. To those who have not tried it I can recommend *Viburnum macrocephalum*. I grow it in a tub on a terrace, and I find it is far more decorative than any.—R. D.

A bowl of Roses.—How seldom are flowers satisfactorily arranged in bowls, more particularly when Roses are used! An instance of good arrangement in a bowl came recently under my notice, and this in connexion with a very pleasing function. The occasion was the silver wedding of Mr. and Mrs. William Sydenham, of Bolehall House, Tamworth, Staffs, well known to the horticultural world, owing to Mr. Sydenham's efforts in improving the Pansy and early-flowering Chrysanthemums. A large silver bowl, some 12 inches to 15 inches in diameter, standing on an Ebony pedestal, was lightly filled with Roses.

Those for the centre were cut with very long stems, in some instances quite 2 feet to 2½ feet. Long sprays of foliage were inserted here and there, and no other foliage whatever was used. Most of the Roses were cut as partially opened buds, and the wisdom of this selection was seen as the day advanced. Buds of the Teas and Hybrid Teas were made to overhang the sides of the bowl, and it was here that charming sprays of *Cecile Brunner* and *Perle d'Or* were effectively displayed. The foliage was retained on the upper portion of the stems of each variety, so that as it was adjusted in position all bare stems were covered up, and a pleasing finish given to the whole arrangement. This is a class which the National Rose Society might make more of than they do at present.—D. B. C.

The fly plague.—The presence of flies in the house is a reproach. It is a falling away from a high hygienic standard, for the fly is a pestilential fellow. It must be admitted, however, that it is very difficult to keep habitable places free from flies. Poisonous fly-papers are unsightly, and glutinous cords and traps are not very pleasant accessories in the household. Yet it is a matter not only of comfort, but also of health, that the fly should be excluded. The fly may easily be a pathogenic agent, owing to the fact of its choice of environment being oftentimes of the most disgusting character. When a fly walks across a suitable culture medium it leaves infection behind it, as shown in the colonies of organisms which develop on the points with which the insect's legs

have been in contact. The fly, therefore, should be driven out of our haunts. Preventive measures are best, and at this season of the year, when flies are beginning to infest our houses, it is an excellent precaution to cover the window openings with wire gauze. It is a curious fact that flies will not pass through netting, even though the meshes be quite large, unless there be a source of light as from a window behind it. Thus in rooms with windows only on one side a net over the window will absolutely keep the flies out, although the meshes of the net may be 1 inch apart. It is surprising that in railway carriages a sliding frame fitted with wire gauze is not provided as well as the window. Such a sliding screen could be used when ventilation is wanted, while dust and rain would be excluded at the same time. The gauze frame would certainly keep flies out. We have seen carriages on certain of the Continental lines provided with a gauze screen of this kind. There is no reason why a similar arrangement should not be fitted to the ordinary window sash. This would do much to mitigate the great nuisance of flies in the house.—*The Lancet*.

NYMPHÆA GROUP IN THE NEW GARDEN OF THE ROYAL HORTICULTURAL SOCIETY.

loam, sand, and brick dust in equal parts. It is as well to give a light top-dressing of silver sand also to prevent the plant (which is only about 3 inches to 4 inches high) being splashed by mud in heavy rains. These conditions, with a sunny position on rockwork, will suit this lovely plant.—J. Wood, *Plant Club, Kirkstall*.

Fruit failure in Ireland.—Mr. Hartland writes: "I have a good many Apples planted at Ardcairn, but no fruit on any except Worcester Pearmain."

Fruit growers and railway rates. The Earl of Onslow, addressing a meeting in the Town Hall, Maidstone, in connexion with the National Fruit Growers' Federation, last week, expressed the hope that all the farmers of England would follow the example of the Fruit Growers' Federation and combine to promote their common interests. Regarding railway rates it was true the companies had their shareholders to think of, and that they were under obligations to Parliament, but at the same time their business was not to repel traffic but to attract it. Various suggestions had recently been made by the companies, which might prove

The colour is a really beautiful blue. I have seen it in Ceylon covering the whole side of a house. My garden soil is an oolitic clay, the most unpleasant gardening soil I have ever seen. The position is on the southern slope of the Cotswolds, 400 feet above sea level. Lilies promise well. *L. auratum* is about 8 feet high. A clump of *L. superbum* now in flower is magnificent; it is in peat by a small pond. The tallest is 10 feet high. *L. pardalinum*, in a similar place, I cannot get to grow. *L. Browni*, after flowering well for two years, is a failure, but *L. testaceum* always does well. The foliage of *L. Batemanniae* turns yellow before the flowers come out. I think its colour beautiful. A large clump of *L. chalcidonicum* has gone off just in the same way that *candidum* often does. The latter this year in the village gardens is splendid; mine are very bad. *L. Martagon album* was very good, also one bulb of *L. colchicum* (out of eight) had a splendid head; the rest have not yet appeared. These were planted two years ago. Of Irises none have flowered well this year. *I. aurea*, *I. Monnierii*, *I. monspur*, and *I. ochroleuca* had no flowers. *I. Kämpferi* will

Strawberry Loxford Hall.—This does not appear to be much grown. We are asked by gardeners its name when they see it doing so well in our garden. I am quite aware that Strawberries are much better in some soils than they are in others. In proof of this since I have been here I have grown most of the leading sorts, and I believe I should not suffer if I confined myself to this, Royal Sovereign, and President, though I grow several others. But the three above named are most relished in our garden, Royal Sovereign being first, President following very closely, and Loxford giving a fine late supply. This year we gathered fruit for five weeks continuously from these three sorts growing side by side in the open garden. Loxford crops enormously, and when thinned the fruit is large, conical, and handsome, being bright crimson, and with a very white flesh of excellent flavour—not too sweet. Added to this the fruit travels well. With us two year old plants crop best. The foliage is rather large and long, and needs plenty of room.—J. CROOK, Chard.

Eranthemum tuberculatum.—This species usually flowers more freely towards the end of the summer and in early autumn than at any other time, but it has now been for some weeks in bloom in the T range at Kew. It differs greatly from the species commonly met with, such as *E. pulchellum*, whose flowers are collected in a terminal cone-like head, for in this they are scattered over the shoots; whereas many of the *Eranthemums* are of upright growth and sparsely branched; this forms quite a little bush, with its slender branches clothed with small ovate leaves. The flowers are pure white, over 1 inch across, and in general appearance suggest those of *Bouvardia Humboldtii corymbiflora*. As it will bloom freely in pots only 5 inches or 6 inches in diameter it is very useful for small houses. This *Eranthemum* was introduced from New Caledonia about forty years ago, but never became popular, and is now rarely seen. Given a structure maintained at a stove temperature it is both easy to propagate and to cultivate.—H. P.

Tropaeolum speciosum.—Mr. H. J. Veitch's efforts to establish this richly-coloured *Tropaeolum* in quantity by the side of the north entrance to his house at East Burnham Park has been singularly successful, the plants being now so much at home that growths come up freely even among other climbers. In previous years the support furnished has been simply tall *Pea* sticks, but these did not prevent the shoots from running in among the shrubs behind and thus losing much of their beauty. This spring the sticks were coated with fish netting, and round this the leaves twine themselves. Certainly this *Tropaeolum* will attach itself to walls, fences, or other objects, but it seems to be peculiarly attached to such soft material as netting. The result as seen now is a fine face of rich colour, which for a long season remains an object of exceeding beauty.—A. D.

Tibouchina heteromalla.—Everyone knows the universally admired *Tibouchina semidecandra* syn. *Tibouchina macrantha*, *Lasiandra macrantha*, and *Pleroma macrantha*, but the species at the head of this note is rarely seen, though it forms a handsome specimen. True, it is not equal to *T. macrantha*, but then this last is in every way of exceptional beauty. A fine specimen of *T. heteromalla* planted out in the Mexican portion of the temperate house at Kew is now flowering freely. It forms a bold growing bush, with sturdy stems clothed with elongated heart-shaped leaves, covered with silky tomentum, which is more pronounced on the under than the upper sides. The flowers, which are borne in a many flowered panicle, are violet-purple, and about 2 inches across. It is more fitted for planting out, as at Kew, than for culture in pots. This species is a native of Brazil, from whence it was introduced in 1819.—T.

Notospartium Carmichaeliae.—This, popularly known as the Pink Broom of New Zealand, is both pretty and uncommon, while it is also hardier than most natives of those islands; in fact, in the neighbourhood of London it is rarely injured in winter. As indicated by its popular name, it bears a close resemblance to a Broom,

having the same green leafless branches, which are in the case of the *Notospartium* gracefully arranged. The flowers are small, *Pea*-shaped, of a bright rosy pink colour, and borne usually in July, in dense crowded clusters towards the points of the shoots. Not only are they pretty in a mass, but individually, from their delicate markings, they will repay close investigation. From the drooping habit of the plant it is perhaps seen to the best advantage on bold rockwork, where the branches have space to develop. In its native country it is said to reach a height of 20 feet, but here it can only be regarded as a shrub. It is interesting as being one of the few members of the order Leguminosae indigenous to New Zealand, for, strange to say, though so numerous in Australia, very few occur on these neighbouring isles.—T.

Flowers for butterflies.—I have read with great interest your correspondents' notes on plants attractive to butterflies, but I think Mr. Wolley Dod mentioned last week the best plant, viz., *Sedum spectabile*, for I may say, with miles of flowers, none seem to be so attractive in its season to both bees and butterflies. An edging of *Sedum spectabile* is a boundary border fully 200 yards long in one of our kitchen gardens, and is a veritable picture each year during August and September, more from the myriads of visiting butterflies than from the flowers themselves. Elsewhere, whether in masses, lines, or single plants, it is the same, butterflies everywhere. Like Mr. Wolley Dod, I was also surprised at the omission of this plant from the list.—J. R., *The Gardens, Tan-y-bwlch, North Wales.*

Senecio Clivorum.—At the Drill Hall on Tuesday last were to be seen some finely developed examples of this bold Chinese plant. Far too bold, vigorous, or, as some would say, coarse growing for the ordinary border, it is yet an ideal plant in certain positions in the garden. And it is here that the value of any plants, large or small, depends, viz., that of being rightly placed; indeed, the above plant would be as unsuitable in the ordinary border as any of the more minute alpine, and this is the extreme in both directions. But as there are uses for the more dwarf alpine, so too is there a place for the boldest of perennials. Some of the places in which this *Senecio* may be seen to advantage are the wild garden, the river-side, or waterside garden. Where boldness on the margin of lake, or pond, or stream should be a feature, and again in isolated positions on the lawn or in the large shrubbery border, in any or all of these this plant would create a feature not easily or readily imitated. The roundly peltate leaves are about 20 inches in diameter, the many forked inflorescence attaining to some 4 feet high. The flower-heads are numerous and large, the colour being rich orange. The plant is easily grown, quick to develop, and quite hardy.—E. H. JENKINS.

The Scientific Committee of the Royal Horticultural Society.—An "Admirer" of the work of the scientific committee deploras our unkind remarks about this body in *THE GARDEN* of the 1st inst. We are not aware that the remarks were "unkind." All we intended to convey was that this committee does not adequately represent the scientific side of the society. It has no influence on horticultural science, and simply sits, as its reports show, to answer commonplace questions. Very few of the members attend, though the list contains over seventy names, with Sir Joseph Hooker as the chairman. We are only sorry that such valuable material is so wasted.

A new Peach (Libra).—The fruit committee of the Royal Horticultural Society, at their meeting on the 4th inst., gave an award of merit to a very fine Peach sent by Mr. William Taylor, of the Osborn Nursery, Hampton, under the name of *Libra*, and though finer fruits were exhibited from the same tree on the 21st ult., those sent on this occasion showed its value as a very early variety. It is a seedling, and is remarkable for its growth in a cool house, as the fruit staged only had partial shelter in severe weather. This will prove its value for first dishes from open walls given slight protection in severe weather. The

fruits are large, very juicy, and of a beautiful colour, only slightly coloured on the sunny side. They somewhat resemble a fine *Noblesse* with its melting flesh. I think its parents must have been very early varieties. Early *Alexandra* was named, but it is larger, and if a better forer it will be a most valuable introduction and well worth growing, as large Peaches are always liked, and if early they are invaluable. I fear in most gardens early Peaches are very scarce, as in our case we not only lost the crop, but trees also, owing to the cold last May.—G. WYTHES.

Irish Gardeners' Association and Benevolent Society, Dublin.—The following is a copy of an address received by His Majesty the King at Dublin Castle on the 22nd ult.: "To His Majesty Edward VII., King of Great Britain and Ireland, Emperor of India, &c.—May it please your Majesty, we, on behalf of the Irish Gardeners' Association and Benevolent Society, beg to tender to Your Most Gracious Majesty, and to your illustrious Consort the Queen, our most loyal and hearty welcome on this your first visit to Ireland since your Majesties' accession to the Throne. Representing, as we do, a large body of your loyal subjects, who appreciate the great interest your Majesty takes in the welfare of those engaged in horticultural pursuits, and in honouring with your Royal patronage the Gardeners' Royal Benevolent Institution and the Gardeners' Royal Orphan Fund of England, whose objects are of a similar character to our own, we feel that the present is a fitting opportunity to express our sincere gratitude and profound respect on this occasion of your visit to Dublin, and we humbly hope and pray that it may be your Majesty's gracious pleasure at some future date to honour with your illustrious patronage the Irish Gardener's Association and Benevolent Society.—Signed, on behalf of the society, F. W. Burbidge, M.A., M.R.I.A., V.M.H., president; John J. Egan, J.P., James Cavanagh, F. W. Moore, A.L.S., M.R.I.A., V.M.H., vice-presidents; W. S. Hall, honorary secretary."

Chinese conifers.—The *Journal of Botany* for August contains an enumeration by Dr. Masters of the conifers collected in various parts of South-Western and of Central China by Mr. E. H. Wilson on behalf of Messrs. James Veitch and Sons. Dr. Masters writes: "Seeds of most of the species were gathered, and the seedling plants are in cultivation in Messrs. Veitch's nurseries. Mr. Wilson's specimens are excellent, but were mostly collected in the districts previously visited by Dr. Henry, the Abbé David, and others, as enumerated in the *Journal of the Linnean Society*, vol. xxvi., page 540 (1902). Nevertheless, there are few novelties among them, and as the specimens have been distributed in several of the herbaria of this and other countries, a brief enumeration may be desirable."

INTERESTING PLANTS IN FLOWER.

Temperate House.

BEGONIA CARMINATA, *Calceolaria integrifolia*, *Cassia laevigata*, *Erythrina Humel*, *Kreysigia multiflora*, *Lilium Henryi*, *Lonicera etrusca*, *Muschia Wallastoni*, *Myrtus Luma*, *Statice pectinata*, *Tibouchina heteromalla*, and *T. macrantha*.

Water Lily House.

Solanum pensile.

Greenhouse.

Begonia coccinea, B. President Carnot, B. tuberous-rooted, *Bredia hirsuta*, *Campanula Vidalli*, *Carnations* in variety, *Datura Knightii*, *D. suaveolens*, *Francia ramosa*, *Lobelia tenuior*, and many other things.

Orchid Houses.

Angræcum chailluanum, *A. eichlerianum*, *Bulbophyllum grandiflorum*, *Cypripedium Parishii*, *Dendrobium chrysanthum*, *Epidendrum floribundum*, *E. radiatum*, *Gomeza planifolia*, *Gongora*

galeata, *Hemaria dawsoneana*, *Listrostachys forcipata*, *Luisia brachystachys*, *Maedevalia maculata*, *M. reihenbachiana*, *Megacolinum triste*, *Miltoia castanea*, *Oberonia ensiformis*, *Odontoglossum bitionense*, *O. Uro-skinnei*, *Oncidium crispum*, *O. Gardneri*, *O. incurvum*, *O. ramosum*, *Ornithidium bicolor*, *Pachystoma thompsoniana*, *Polystachya lawrenceana*, *Rostrepia antennifera*, *Rhynchosyris retusa*, *Sarcanthus pallidus*, *Sobralia macrantha*, and *S. xanthina*.

T Range.

Allamanda violacea, *Anigozanthos coccinea*, *Aristolochia gigas* var. *Sturtevantii*, *Billbergia meiziana*, *Costus speciosus*, *Cotyledon teretifolia*, *Crossandra undulata*, *Echinocactus micro-spermus*, *Emilia amplexicaulis*, *Hoya imperialis*, *Ixora* in variety, *Ixora coccinea* var. *Fraseri*, *I. macrothyrsa*, *Kempferia Kirkii*, *Kleinia Galpini*, *Ruellia amena*, *Stigmaphyllon ciliatum*, and *Tillandsia duvaliana*.

Rock Garden and Herbaceous Borders.

Acanthus spinosus, *Campanula carpatica*, *Echinacea purpurea*, *Erigeron alpinum*, *Eryngium* in variety, *Inula macrophylla*, *Lathyrus latifolius*, *Lavatera trimestris*, *Liatris spicata*, *Lobelia sessilifolia*, *Melilotus officinalis*, *Morina longifolia*, *Oenothera missouriensis*, *Pentstemon* in variety, *Platycodon grandiflorum*, *Polygonum amplexicaule*, *Salvia* in variety, *Senecio saracensis*, *Spigelia marilandica*, *Swertia perennis*, *Veronica incana*, *V. spicata*, *V. subcaerulea*, *V. virginica*, and many other things.

Arboretum.

Buddleia variabilis, *Ceanothus* in variety, *Clematis* (various), *Indigofera gerardiana*, *Lycium pallidum*, *Olearia Haastii*, and various *Spiræas*.

THE ROSE GARDEN.

JOTTINGS ABOUT ROSES.

ROSA MACRANTHA LUCY.—Quite a number of new forms of *Rosa macrantha* have made their appearance lately, and when at Cheshunt I was especially pleased with the semi-double white variety named *Lady White*, sent out by Messrs. Turner. *Lady Sarah Wilson*, a semi-double blush variety, also sent out by Messrs. Turner, is pretty, but not equal in beauty, in my opinion, to the variety which forms the subject of this note. It is a cross between *macrantha* and that old favourite *Charles Lawson*, and the vivid single pink flowers, which measure over 6 inches across, are extremely beautiful. This was one of the good things which I noticed in Messrs. Veitch's Coombe Wood Nursery at the end of June, and it is one that will no doubt become popular as soon as it is distributed. I should much like to see a bright crimson *macrantha*, and this might possibly be obtained by crossing the type with, say, *Grüss an Teplitz*. What a glorious hedge a selection of these new *macrantha* seedlings will make.

Evils of grafting.—The trouble is that nearly all the plants sent from nurseries are budded, and sooner or later up comes the insidious Briar and starts to gain the mastery. There is really no excuse for grafting such free-growing *Roses* as these, and, as with the *Penzance* Briars, they should always be on their own roots. Fortunately, they strike easily, and, if plants on their own roots are not to be obtained from the trade, one can at least raise a stock of plants by this method; for unless most of these free-growing garden *Roses* are grown on their own roots, half the summer will be taken up in looking over and destroying Briar suckers. The same remarks apply to the *wichuraiana* hybrids. As everyone knows, these *Roses* grow into perfect mound-shaped thickets, and it is a physical impossibility to eradicate Briar suckers from amongst the dense thorny mass of prostrate or semi-prostrate growths. And while on the subject of *wichuraiana* *Roses* I should like to enquire as to whether any readers of

THE GARDEN have seen Messrs. Barbier's newest set of hybrids—*Adelaide Moullé*, *Edmund Roust*, and *Elisa Robichon*—and, if so, would they be kind enough to say whether they are improvements on those we now possess? I have just ordered two new American hybrids under the names of *Sweetheart* and *Débutante*, raised by Mr. H. Walsh of Massachusetts. The former is stated to be very hardy and of great vigour—a cross between *wichuraiana* and *Bridesmaid*. The flowers are borne in clusters, and are perfectly double and fragrant, each individual bloom being 2½ inches in diameter. *Débutante* is the result of crossing *wichuraiana* with *Baroness Rothschild*, and is a vigorous climber, bearing large clusters of fragrant double pink flowers.

Preserving poles and stakes.—I am often asked as to what is the best preservative for the wooden poles and stakes so frequently used to support *Roses* and other climbers. Some people advocate dipping that part of the wood which is placed in the ground with tar, but for this purpose I always use a much cleaner and better preparation known as *Carbolineum avenarius*. This is manufactured by Messrs. Peters, Bartsch and Co. of Derby, and looks like a dull coloured varnish. It should be applied hot to that part of the wood which will come into actual contact with the soil, and about 1 foot of the wood above the surface of the soil should also be treated, in just the same way as one would apply varnish. Care should be taken not to get it on the hands or clothes, as it is a rather corrosive preparation. As with tar, care must also be taken to keep it away from the roots of the climbers, but if the poles or stakes are treated with this preparation about a couple of months before they are required, it will have thoroughly soaked into the wood, and the roots will then take no harm. I have used this preparation now for some years, and can recommend it with the greatest confidence. Mr. George Paul has promised me to give it a trial, and if any readers of THE GARDEN wish for further information on this subject I shall be happy to furnish them with it.

Mr. Molyneux and new Roses.—Mr. H. E. Molyneux's notes on new *Roses* are always of great interest, and many rosarians who are unable to visit either shows or nurseries look to his trite and pertinent remarks for guidance. There is one splendid garden *Rose* which appears to have escaped even his "eagle" eye. I refer to

H.T. La Tosca, which came to me from Cheshunt with an excellent character, and I am quite able to endorse the good opinions which Mr. G. Paul has formed about it. Not only is it a splendid grower, but it has proved very hardy, and recovered from the spring frosts before the majority of *Roses*. The pale green wood is practically thornless, and in this respect it is quite distinct from either *Vicountess Folkestone* or *Caroline Testout*, between which it is really intermediate. The blooms are produced in good sized clusters on erect stalks; they are of good form, fragrant, and, though not full, stand rain well. The colouring varies from pale rose to pale salmon-white, sometimes blush white. It is the result of a cross between *Josephine Marot* and *Lucile*.

Golden yellow Roses.—I am afraid those who plant *Perle von Godesberg*—the much-vaunted sport from *Kaiserin Augusta Victoria*—in the hope of getting a mass of golden yellow blossom will be decidedly disappointed. I saw a batch of some twenty plants in the open ground the other day, and I also noticed several flowers at *Wolverhampton*, but no golden yellow was discernible. With Mr. Molyneux's permission, I will, therefore, amend his description and say "occasionally comes a fine golden yellow." Two *Roses* which, to my mind, much more nearly approach this colour description, are *Billiard* and *Barré* and *Georges Schwartz*. Unfortunately, neither are satisfactory. The former was crippled here in the winter, and this is not surprising when one remembers that it owes its exquisite colouring to the lovely but rather tender *Duchesse d'Auerstadt*. By the way, I noticed that "M. L. W." speaks very disparagingly of the colour of *Billiard* and *Barré*, which proves to me that your correspondent has not yet seen this

variety in good form. I had some splendid flowers from this *Rose* last year, but I am afraid it is so injured that it is not going to bloom at all this year. *Georges Schwartz* is a surprisingly beautiful colour, but its constitution is atrocious. I have a lovely rich deep yellow bud of this variety before me as I write, and cannot help thinking how splendid this *Rose* would be for bedding if only it would grow. Unfortunately, it comes of bad parentage, and with *Roses* as with human beings the old proverb, "What's bred in the bone," holds true. *Georges Schwartz* obtained its rich colour from that glorious yellow *Ten Souvenir à Mme. Levet*, a variety not suited for an English climate.

Rose names.—I have just received a list containing the names and descriptions of most of the latest *Roses* from Continental raisers. One would imagine that those who devote their lives to raising beautiful flowers could easily devote a little of that time to finding pretty names for them. Some of these *Rose* names I would not attempt to pronounce, and an "Acme" label would certainly never contain them. Here are just six of the choicest:—

Frau Dr. Thekla Schlegemilch (*Princesse de Sagan* × *François Dubreuil*).

Julius Fabianes de Miesfa.

Frau Lilla Rautenstrauch.

Comtesse Gustave Lannes de Montebello.

Dr. Eugen Teixeira Leite.

Erinnerung an Schloss Scharfenstein.

Suzanne Marie Rodocanachi and *Grossherzogin Victoria Melita* are not the easiest names to pronounce, and it appears to me that we shall have to adopt the American idea and re-christen any of the really meritorious Continental varieties with such outlandish titles as those which appear in the above list.

ARTHUR R. GOODWIK.

The Elms, Kidderminster.

NOTES FROM SWANSWICK.

SEEDLINGS FOR THE ALPINE ROCK GARDEN.

I AM now trying a new plan, or, at any rate, one I have not seen recommended, with seedlings intended for the alpine rockery, sunny or shady. This is to transfer them early from the seed-box without disturbing the roots, and, if necessary, in little clumps, into 2-inch pots, and let them just fill these with roots, then turn them out into their permanent places. They are so much the better for taking an unbroken set of roots, in full activity, into the new life out of doors, and yet one does not want to wait while they fill 2½-inch pots, because by that time it is late for them to take thorough hold before winter and its trials.

Foreign nurserymen use 2-inch pots, I believe, extensively, but in this country they are so little cared for that I find it impossible to buy them locally, and they seem only known in connexion with small Ferns and scraps of Cactus. Yet they have another merit besides that of bringing on alpine; they are most useful for sending seedlings about. A little clump of some small alpine plant established in one of these miniatures, 1½ inches across, travels infinitely better than as an uprooted tuft from the seed-box. The 2-inch pots do not dry up so quickly if they are plunged to the rims in a tray of moss or sand, in a frame, or in the greenhouse, or even out of doors.

Most of the *Oxalis*es are flowering now, and some are very attractive. A planting of *O. floribunda* is more or less a failure, because the bulbs were not true to name, some being the ordinary *O. rosea*, which has a smaller and darker flower, and some being white. They will be superseded for next season by *O. Bowiei*, which has lovely satiny rose pink flowers in large umbels, and is a most persistent bloomer. *Oxalis arborea*, with large white flowers and pale large leaves, would be more popular if it remembered "Handsome is that handsome does," and stayed open for a few hours daily, instead of taking every possible opportunity to put up the shutters. *O. lasiandra*, about 10 inches high, with very bright pink flowers having gay Apple green centres and woolly stiff stems, with dark eight-lobed leaves, is handsome and very distinct,

but also too fond of repose. The pink *O. venusta*, 4 inches to 5 inches high, and the white *O. vespertilionis*, complete my present collection, that yet lacks one of the best—*O. enneaphylla*, which is "on order" for next planting time.

ROSE MAMAN COCHET.

At the Bath Rose Show someone was overheard singing the praise of White Maman Cochet in no faltering tones. The example in a first prize box was certainly perfection, and it was claimed for it that it had visited three separate shows on that and the preceding days, and had had equal honour at all. In this garden, though but newly planted, it is exquisite, but, although not so covered with bloom as *Innocente Pirola*, of all our Teas the most heavily laden, and perhaps the fairest. This waxen flower, so high-centred and so exquisitely reflexed of lower petal, is one of those rare dreams of beauty fit for a world without sin, and it is aptly named; far more angelic, surely, with its delicate and faint, yet intensely sweet perfume, than the heavily-scented White Mary Lilies that stand for the type of innocent virginity. M. L. W.

ROCK GARDENING

A FAMOUS ROCK GARDEN.

WE are pleased to give an illustration of the beautiful rock garden at Friar Park, Henley-on-Thames, the residence of Mr. Crisp.

It is not a rock garden that shows an attempt to reproduce the flora of the Alps in a circumscribed space, and the lesson may well be taken to heart. Those who have fairly spacious rock gardens and wish them to be beautiful places and not merely the receptacles of a quantity of different plants, can only secure such a result by putting upon themselves severe restraint as to the number of kinds to be used at a time. In gardening as in painting no picture can be beautiful whose composition is crowded and confused. There are various considerations that influence the choice of the plants that the rock planter will put together, but we think that the following suggestions would be worthy of consideration: First, to determine which are the plants that give us the truest pleasure. Then to consider which of these will group best together and flower at the same time; for, supposing four or five favourite kinds of plants to be grouped and partly intergrouped, it is a great advantage to let them be those that will bloom together and make one complete picture, and to have the intermediate sets of groups to bloom later in their turn. This is a much more pictorial arrangement than to have the plants flowering in scattered irrelevant patches quite unrelated to each other.

Suppose, therefore, that a spur of rock garden is crowned with bushes of *Andromeda floribunda*, and that steep rocks below it are clothed with *Aubrietia* and *Arabis*, and that at their foot in cool peaty ground there is a generous planting of *Primula denticulata*. Here are four capital things of early April, all in full flower together, making one complete picture, and these four are quite enough. The colouring is of the simplest possible and delightfully harmonious, and the whole thing is so good a picture that one dwells upon it, and

IN THE ROCK GARDEN AT FRIAR PARK, HENLEY-ON-THAMES, THE RESIDENCE OF MR. CRISP.

comes back and back to it to enjoy its beauty in a way that one never does to a more mixed planting of individual objects.

It is, of course, more easy to do in large spaces, but even in small ones the same thing may be done in square inches instead of square feet by choosing plants of smaller dimensions.

Such an arrangement for the pictorial part of a garden by no means precludes the enjoyment of individual plants, but we think it is wiser to have these in a separate place in a series of rectangular raised beds, where each plant may occupy its own pocket, and be as easily visible and accessible as a book on a shelf or a specimen in an economic museum. Such raised beds as are in Messrs. Frobels' delightful nursery at Zurich could hardly be improved upon. They are perhaps 6 feet wide at the bottom and 15 feet long. They are steeply rock built, and accommodate a large quantity of plants.

If the beds are placed east and west as to their length it will give each a shady and a sunny side; a ridge of small shrubs at the top would give more shade on the north side. Such beds also afford the best opportunity of suiting plants with special soils, for one may be built of limestone, another of granite, another of sandstone, and so on, so that plants from all kinds of geological formations would find themselves at home. The plants in these rock beds would be grown distinctly as samples and labelled, then those that were the best liked and that showed the most aptitude for making good combinations for the rock garden could be increased and brought into better use.

Labels should never be seen in the beautiful rock

garden; they are destructive of all pictorial effect and damping to the sentiment of the truest enjoyment of plant beauty. You want your rock plant to say to you in cheerful sympathy: "I am one of the loveliest of the plants that God has given you for purest pleasure and for your bettering in gladness and thankfulness;" and not merely to inform you with cold official ansterity, "I am *Aubrietia deltoidea* (De Candolle)."

THE FLOWER GARDEN.

ALPINES IN A WET JULY

A PIOUS old woman in the Eastern Counties, speaking of the recent weather, gave her opinion that it was "perfectly bigamous," using probably the worst epithet in her vocabulary for anything superlatively wicked and bad. Yet, however unfavourable the saintly arbiter of summer rain may have been to haymaking and garden parties, he has dispensed his gifts in a way which has suited rock plants. I am writing on the last day of July, at a date when the rockeries generally look rather bare of flowers and withered, but this year they are full of gay colours and luxuriant foliage, for which they have to thank the abundance of rain. I mention a few of the best and dwafier kinds, with brief notes on their treatment, which I am told are always welcome for beginners. *Cyananthus lobatus* and *Gentiana septemfida* are now at their best. The first likes an aspect almost entirely sunless and not too dry. It disappears so completely in winter as to be in danger of having some usurper less worthy of the site crammed over it, for the roots are so slender as to be hardly visible. The *Gentiana* likes partial shade, but is glad of the intermittent gleams of sunshine we have had to expand its flowers fully. Though it grows slowly from seed, it lives long. The dwarfier varieties, less than 6 inches high, are best for rockeries, and this stature proves hereditary from seed. Most conspicuous now are the *Campanulas* of the *carpatica* tribe. It requires time and patience to get a good dwarf collection of these, representing all shades, from dark purple to pure white. A hundred seedlings from a choice selected plant will often fail to produce one individual worth perpetuating. The dwarfest and best are often impatient of division, and must be increased by cuttings taken to the bottom of the stalk in spring. The shape of the flowers varies as much as the colour from the pelviform type, which it is rare to find either very dwarf or pure white, to the deep broad bell of the turbinate and funnel-shaped forms. The spreading septemfid, or seven-cleft flowers of Pritchard's variety *Riverslea*, are showy and good, but in stature it is too tall for a rockery.

Then there are the Harebells. These, too, must be carefully and patiently selected, and not allowed to seed indiscriminately into a

jungle of tangled and prostrate stems all over the rockery. A good form should not be more than a foot high—often much less—and should have a stalk strong and elastic enough to resist wind and rain, and to rise again soon after a thunderstorm. It is little use trying to make the varieties or sub-species answer to names which will always be disputed, but they must be chosen by sight and then isolated. Some of them assume a caespitose habit, and can be divided; others must be increased as advised above by spring cuttings. Seedlings from the best should be raised till flowering in pans and pots, but they come untrue and disappointing. I have sown seed from a choice white form which did not produce 5 per cent. of white flowers. Varieties with white flowers are, as a rule, later than those with blue. *Geranium argenteum* is conspicuously good now. It is one of those plants which enjoy rain when in flower, though too much wet in winter kills it. The little bushes are unusually luxuriant and full of flower; here and there one is pure white, others are uniform bright rose, with a beautifully pencilled centre. Birds take most of the seeds, but some are shot into crevices of the stone, and grow where it would be hardly possible to insert plants. I do not distinguish *G. cinereum*, because in cultivation it seems to come from the seed of *argenteum* indiscriminately. *G. subcaulescens*, with green leaves and darker flowers, but equally dwarf, is also good.

The dwarf St. John's-worts (*Hypericum Coris* and *H. nummularium*) are both at their full. The former sows itself, and obstructs little on the sunniest slopes, spangling with thousands of flowers whenever a gleam of sunshine comes. The other grows at home in the Pyrenees, on the face of dripping rocks, so is especially pleased by the present weather. *H. reptans* and *H. olympicum* are just coming to their best. *Epilobium luteum*, rather new in cultivation, a few inches high, with yellow flowers and perennial, is not so good as *E. obcordatum* with rose-coloured flowers; this last must be frequently renewed from cuttings or it dies out. I have more than once commended the dwarf forms of the wild *Veronica spicata*, 6 inches high; their colours are pure white, bright pink, and purple. The collected plants which I bring from Llandudno are the best, as they all, especially the purple, have a tendency to increase in stature from seed, but when two or three years old the original plants can be divided. Not 5 per cent. of the pink come true to colour from seed. An inch of limy soil over a hard stony base suits them.

Amongst dwarf *Campanulas* I should have mentioned *C. waldsteiniana*, which is this year flowering with unusual vigour, both in the stature and breadth of the plants. Few alpine require greater care to save them from being smothered in spring. They are divided more easily than raised from seed. Two Italian species, *C. elatines* and *C. elatinoides*, were sent to me by the late Mr. W. Thompson, and thrive and increase on a rocky slope facing south, and sheltered by Douglas Fir, the prevailing soil being decayed Fir needles. They resemble *C. garganica*, but grow more diffusely and flower more densely and later.

Other rather tender *Campanulas*, like *C. isophylla*, as well as hardy *Cyclamens*, show their appreciation of this site. I should like to mention two miniatures, not because they make any show, but for their rarity in cultivation. One is *Statice gougetiana*, having all the typical characters of a Sea Lavender, but only 2 inches high to the top of the flower. The other is still dwafier in stature, and tries to compensate its small size by its long

name, *Acanthosonchus Cervi-cornu*—"Thorn-Sowthistle Stag's-horn." These words are descriptive of the plant, the flower being a miniature yellow Dandelion. It was given to me without any information as to its native country.

Yellow Flax is in full flower and very showy, and will continue to be so for three months. It is only allowed at the base of the mounds or the seedlings become troublesome. Of the less common late *Sedums*, I can speak well of *S. trifidum*, with luxuriant tufts of green rosettes and pink flowers, for moist and rather shady spots. *S. oreganum*, with yellow flowers and bright red leaves, and *S. asiaticum*, of dwarf, slender growth, with small yellow umbels. Of course *S. kamtschaticum* is indispensable, and, perhaps, the best of all *Sedums*. I mention it because the name does not appear in the "Kew Hand List."

Edge Hall, Malpas.

C. WOLLEY DOD.

THE INDOOR GARDEN.

TREE CARNATIONS.

SEASONABLE NOTES.

A L L tree or winter-flowering Carnations that were propagated in the early part of the year, and since that time duly potted on into 4-inch or 5-inch pots, should now be ready for the final shift into the pots in which they are to flower. What size these latter should be will depend chiefly upon one or two things, viz., the comparative vigour of growth of certain sorts and not a little upon the size and quality of the plants, as also the general requirements of the establishment where these things are grown. To secure plenty of flowers the final shift must be a liberal one; indeed, if success is to be achieved with this section of the Carnation, the latter should be understood from the very outset to be a soft-wooded plant. The freshly made growth of a Carnation may root in three weeks quite well, and by the end of a month is quite ready for potting into 3-inch pots. Given a month in this the pots should be sufficiently well filled with roots to guarantee the plants being transferred to a 5-inch size. With longer days and continued growth the same plant should at the end of six weeks be again ready for its final shift to the flowering size. This may seem all too quick for those who are content with half a dozen blooms on a plant in a 5-inch pot, but for those who know that in the same period the same plant, with liberal treatment, will readily produce two dozen blooms in a 7-inch pot in its first flowering, and an equal number, if not more, in the second or spring flowering, this rapid succession of shifts is an item that must receive attention. It should, however, be distinctly borne in mind that a large final shift is quite useless, unless the plant is of sufficient size. When the cuttings are young and vigorous, nothing but neglect will produce a hard wiry condition of stem, and where this ensues full development is not attained. Strong vigorous growers like Mrs. T. W. Lawson or America cannot be well grown unless liberal root room is given, together with a good top-dressing in winter. Large 7-inch pots will not be found too large for any stock of these varieties, rooted in January or before that time, while I would readily give pots of 8 inches diameter to any stock rooted and potted in the past autumn. Such bushy low growing sorts as Winter Cheer of the same age may be grown perfectly in pots of 7 inches across. Mlle. Carle, Mrs. Brooks, and other white sorts generally may, for the largest sized plants, be kept in the same size pots, for it is an unmistakable fact that these white-flowered Carnations root less vigorously than either reds or pink-flowered sorts. That old American-raised variety, Wm. Scott, now so rarely seen, is still one of the best for constitution, and a great bloomer, in spite of its rather heavy saw-edged petals. But for those who must have flowers it is

one of the most reliable, and early-rooted plants of it are well content with pots 7½ inches across.

These few varieties are given as examples of the different shades of colour, while duly regarding the vigour of the variety. It is important, too, to ascertain the full development of any variety as early as possible, as only in this way is a guide to be obtained as to the general requirements. With these liberal shifts, a good drainage, moderately firm potting, and liberal root waterings and syringing or damping down about the beds should also be given. A good bed of ashes rendered hard and impervious to worms is the best place for the plants when the final shift has been given. Any plants that have been once stopped and have since formed several side shoots should be now in a condition for the final shift. It is, however, desirable that the potting be accomplished by the middle of July for the later batches. A few days, more or less, in the 5-inch pots will not injure the plants; it is in the earlier days that the mistake is made. Stopping must be regulated largely, if not entirely, by the general requirements of the establishment in which the plants are grown. Generally, however, the flower-spikes should be pushing in September. If this is not the case a weakly flower-spike is most likely to follow, and it is also likely to be destroyed by fog if the plants are grown near London. This is especially true of Winter Cheer, among others; in fact, this red-flowered sort is very quickly affected by fog and insufficient light. It is dwarf, but makes very slow headway, and for this reason the latest time for stopping the shoots for winter flowering should be the middle of July. This period may require modification in hot and dry or very wet, sunless summers. These are the things the grower must watch for. As to soil, use good turfy loam, twelve months stacked, with layers of manure, bone-meal, and soot alternately. Cut straight down this will make a fine mixture roughly chopped with spade, and not sifted at all. When chopped up a free addition of sand and a little charcoal will make an ideal mixture. Highly concentrated manures should be avoided, they are not necessary, and in certain hands are most injurious.

E. JENKINS.

SOUVENIR DE LA MALMAISON CARNATION.

Now that the season of this plant is drawing to a close a few hints upon cultivation may be useful to those who have not hitherto been successful. I will begin with the operation of layering. Pits or frames should be provided for this, and they should be filled to within about a foot from the glass with equal parts of loam, leaf-mould, sand, and a little burnt earth. Should the pits be deep any rough material could be placed in the bottom with about 6 inches of the above compost. The old plants should be knocked out of their pots and planted sideways. The incision is made about 7 inches or 8 inches from the tip of the leaves. Press and peg firmly in the soil, sprinkling a little more sandy soil around each as you proceed. The layers root more quickly when nearly severed. Afford water and keep the pits close and shaded with a little air during the day. In a fortnight or three weeks they should be well rooted; more air should then be given them, gradually increasing it day by day for about a week, when they should be cut clean away from the old plants. A few days later the lights may be taken off, giving the plants plenty of water and exposing to full sunshine. They will make strong growth and plenty of roots, so that they can be taken up and potted into 6-inch pots for flowering. The following year they can be placed in 8-inch and 10-inch pots after flowering.

The earlier the operation of layering can be performed after the plants have done flowering the better; the soil for potting should consist of two parts loam, put through a coarse sieve, and the rough used, together with one part half-decayed leaf-mould, one part old mortar rubble, half part burnt earth, a little coarse silver sand, and a good sprinkling of Bentley's Carnation manure, with a slight dusting of soot over the crocks. The layers, after being potted, should be placed in cool frames

CALOCHORTIS IN CAPTAIN REID'S GARDEN AT YALDING, KENT.

or pits, and kept rather close and slightly shaded for a time. They can soon be fully exposed, excepting in wet weather, until the frost sets in, when they should be housed. Keep them always as near the glass as possible, and if possible provide a cool, moist bottom of crushed coke or sand or shingle. A dry atmosphere in the house or pits must be maintained, and the plants at all times must be kept on the dry side, but should never be allowed to become so dry as to flag. Plenty of fresh air should be given on all favourable occasions, closing the top ventilators almost entirely during stormy weather, leaving those at the bottom open, but at no time attempt to coddle them or employ fire-heat, except in very severe weather. Thick shading is not so necessary as some people imagine; endeavour to give the plants all the sun and light possible, except when in flower, when a thick shade is necessary to prolong the flowering season and to retain colour.

There are now many excellent varieties much easier to cultivate than the old blush and pink. Those who can successfully grow the two latter will find no difficulty in cultivating most of the up-to-date varieties, such as Calypso, Lord Welby, Mrs. Martin R. Smith, Jane Seymour, Margot, Albion, King Oscar, Mrs. Trelawny, Baldwin, and Horace Hutchinson. For these, which should be in every collection, however small, we are indebted to Mr. Martin Smith and other enterprising raisers. Cecilia, grown in the same way as a Malmaison, will be found well worth the space it occupies.

CHARLES J. ELLIS.

Warren House Gardens, Stanmore.

NOTES ON HARDY PLANTS

GROUP OF CALOCHORTIS IN BLOOM.

THESE Calochortis (forms of *C. venustus*) flowered so gloriously this summer that I felt obliged to take a photograph of them. They have been in their present position for six or seven years, in light soil on a sloping south border, and have never failed to bloom satisfactorily. Formerly I used to put

a frame-light over them in the late summer and autumn, but the last three or four years I have not taken this precaution, leaving them severely alone till November, when they get a light top-dressing of fine ashes and peat.

NIEREMBERGIA RIVULARIS.

THE illustration shows a strong and healthy patch of this charming perennial in bloom, and it will be at once noticed that all the flowers are situated either on the portion of the clump which has worked its way under the edging stones into the gravel path, or on that immediately adjoining these stones. This fact has been quite a revelation to me, and may prove useful to those who, like myself, have not hitherto succeeded in blooming the plant satisfactorily. Until this year I had never had more than a dozen blooms or so thinly distributed over the whole surface, but by a lucky chance matters seem now to have righted themselves, and I shall dig up no more

NIEREMBERGIA RIVULARIS AT YALDING, KENT.

straggling tufts from the gravel path, but encourage growth therein, and also insert pieces of stone in the main body of the clump when the foliage has died down. The soil is a strong loam, the gravel in the path also containing a good deal of clay or loam. I need hardly add that this *Nierembergia* is a lover both of sun and water, and requires a good deal of the latter in a dry summer; it is more than likely that the weather of 1902 agreed well with its constitution, and was at any rate partly the cause of so much bloom this year.

Yalding, Kent.

S. G. R.

DRYAS LANATA.

THIS interesting species is growing well in my rock garden, and appears to be more free flowering altogether than *D. octopetala*, to which it is evidently closely allied. As far as I am able to ascertain, the real difference between the two species lies in the fact that *D. lanata* has woolly and narrower leaves than *D. octopetala*. The flowers, too, are a trifle smaller, and the plant is a strong grower with me. *Dryas lanata* is a native of South Tyrol, and is, I believe, synonymous with *D. nivea* of Kerner. I am treating it in the same way as *D. octopetala*—light stony soil and semi-shade—under which treatment it seems perfectly happy. In the supplement to "Nicholson's Dictionary" it is described as "a Tyrolean form of *D. octopetala*, having woolly leaves."

Kidderminster.

ARTHUR GOODWIN.

SYMPHYANDRA HOFMANNI.

ALTHOUGH I prefer *Symphyandra pendula* to the biennial members of the genus, there is a distinctness of character about such species as *S. Hofmanni* which makes it desirable to grow it and *S. Wanneri* as well as the old *S. pendula*, which, one must remark, is not so easily cultivated everywhere. *S. Hofmanni*, sometimes, by the way, erroneously converted into *S. Kaufmanni*, is a biennial only, but it reproduces itself so freely from self-sown seeds that it is practically as good as any perennial in suitable soils. It must be a dozen or more years since I got my first plant, and now there is a severe thinning out annually to prevent one from having a superabundance. Self-sown plants of this species are more vigorous and produce more flowers if left undisturbed than those that are transplanted. This *Symphyandra* is not a showy plant, but it is always pretty and acceptable in the garden from its long flowering—generally from early in July until well into autumn—the flowers being produced in succession. These are drooping, and a rather creamy white in colour. The calyces come down over a considerable portion of the flower, and it is noteworthy that they are almost spurred in form, reminding one somewhat of the spurs of the *Columbines*. The ordinary height of the plant is

from 1 foot to 2 feet, but it varies even more according to the character of the soil and the nature of the season. Its leaves are lanceolate and acute. This *Symphandra* does not seem particular as to soil, but if wanted to reproduce itself from self-sown seeds a rather light one is preferable. It is a native of Bosnia, whence it was introduced in 1884. Although I have flowered a number of plants I have never come across any variation in the colour.

CAMPANULA ALPINA.

AMONG the prettiest of the many beautiful dwarf Harebells one must place *Campanula alpina*, now well in flower. It is not only a choice little plant for the rockery, but it may also be used with advantage in the choicest and most carefully tended borders. It does not appear to be so much cultivated as its beauty would deserve, and it is far from plentiful in nurseries where such plants are largely grown. This is not because of its novelty, for it is not a new plant by any means. It is easily distinguished from the others of its class by its woolly, lanceolate leaves, and by the pyramidal arrangement of its large, deep blue drooping flowers (something like those of *C. Hostii*), which it produces very freely. Its ordinary height is from 6 inches to 10 inches, and, like many flowers with woolly foliage, it appears to like rather a dry situation. I find that the slugs are fond of this plant, and at certain seasons they require to be searched for in its neighbourhood and destroyed, unless it is protected by a zinc ring. It likes a sandy peat soil, with the addition of a little lime. S. ARNOTT.

Carsethorn, by Dumfries, N.B.

AN ARTIST'S NOTE-BOOK.

A NEW NYMPHÆA.

(*N. GIGANTEA HUDSONI*.)

A SEEDLING raised by Mr. Hudson and an improvement in size and colour on *N. gigantea*. We saw the plants recently, and thought few of the more heat-loving *Nymphæas* so beautiful and distinct. It is in a frame, and the water is kept just warm, the flowers appearing in profusion and measuring individually from 8 inches to 10½ inches. As the illustration suggests, the segments are broad, while the colour is a clear blue, deepening in the outer segments. It was awarded a first-class certificate recently by the floral committee of the Royal Horticultural Society. The *Nymphæas*, both the species and hybrids, and *N. stellata* and its forms, are very beautiful just now in the Gunnersbury House garden.

ROUND ABOUT A GARDEN.

MORE BUTTERFLY FLOWERS.

WHEN writing of the flowers that attract butterflies and moths, I omitted to mention

two which are almost the most alluring of any. These are the *Ageratum*, both blue and white, and that sweetest of flowering herbs, common *Lavender*. All kinds of perennial Sunflowers are attractive, too, to a certain extent; but, as a rule, you will not find that the butterflies love showy flowers. Many of their favourites are greenish yellow; and of the rest the majority fall within a range of modest colours, from bluish grey through faint purples and mauves to dull crimson. Not that we need credit the butterflies with æsthetic tastes which revolt against gaudiness. The fact is, no doubt, that gaudy flowers do not have honey and perfume to the same extent as their more modest-hued sisters.

COLOUR versus PERFUME.

Regarding Nature from the sentimental stand-

bright colours, honey, and perfume of flowers to the tastes of insects.

THE FIRST RED ADMIRAL.

To return, however, to the garden, where I for one think that we are amply repaid for a certain loss of ordered beauty by the presence of perfume and butterflies, there is always a touch of sadness in the pleasure with which one witnesses the arrival of the first Red Admiral among the late summer flowers. It is so undeniable a sign of approaching autumn, because we know that the long months of winter must pass before that butterfly will fulfil the purpose of its life, and lay its eggs upon the rank-growing shoots of Nettles in the spring. The 1st of August may be taken as an average date for England generally when you may look for the Red Admiral, and its advent is quickly followed by multiplying signs of the coming of autumn.

THE ROBIN SINGS AGAIN!

Within a week, for instance, you may hear the robin sing—this year, indeed, one sang in my garden before the end of July—and I know no sound more abruptly suggestive of winter than the sudden trill of a robin in a silent shrubbery near the house. Even before he sings the robin has told us that times are changing in the garden by the chattering note which he uses when he begins to claim his sphere of influence for the autumn and winter. This “chit-chit” is his war-cry. With it he abuses the cat, challenges his rivals, and punctuates his skirmishes among the shrubs. Later, when he begins to sing, you know that his preliminary conflicts have ended satisfactorily, and that he is announcing to all whom it may concern his possession of a winter residence, which he is prepared to defend against all comers.

DAHLIAS AND FROST.

With the Dahlias just coming into their splendour, however, it seems absurd to be thinking of winter, even when the robin sings, although perhaps it happens more often than not in exposed districts that the Dahlias are cut down by early frost before the best of their flowering time is past. No garden wreck is more suddenly complete than the collapse of the frost-bitten Dahlia. On the previous afternoon the spiky blooms of wondrous hues gleamed like clustered coronets of splendour above their solid pyramids of stout, rich foliage. In the morning, for a brief space, they look more beautiful still, if possible, with their silver-edged leaves and the colours of their blooms glowing like tinted flames through a dainty veil of frost. Even when the sun, rising in the sky, has licked off the last of film of

THE NEW NYMPHÆA GIGANTEA HUDSONI.

(Two-thirds natural size.)

(Raised by Mr. Hudson, gardener to Mr. Leopold de Rothschild, Gunnersbury House, Acton.)

rost's sugarwork, the Dahlias keep up a brave how. Their flowers never looked so brilliant, nor their leaves so richly green, as when they stand glistening with melted hoar-frost and returning the sun's stare as though nothing were amiss. But a deeper hue creeps quickly into the leaves; the flower-stalks nod more and more; and very soon all the queenly Dahlias drop, black and dragged wrecks, around their stalks, suggesting in their ordered rows the spect of some heathen amphitheatre on the morrow of a Christian holocaust.

DAHLIA FASHIONS.

This susceptibility to frost is the worst drawback to the Dahlia as an autumn flower, though I do not suppose that it would interfere greatly with its utility or the purpose for which it was first introduced—as a food-plant to take the place of the Potato. One can hardly realise that English gardeners first knew the Dahlia as a vegetable, though in insisting upon treating it as a garden flower they can hardly have foreseen the splendid results which its cultivation would produce. We have been very capricious in its treatment since then, first moulding it in one way until we achieved blooms of marvellous hues, as at and smooth and round as any butcher could carve out of a Turnip and dip in aniline dye to decorate his Christmas meat withal, then suddenly abandoning this amazing triumph of our own creation in favour of the sweet simplicity of "single" flowers of tender æsthetic tints. Just, however, when we were on the point of hoping to get our single Dahlias as big as soup-plates, we were suddenly switched off to another line in pursuit of the Cactus Dahlia, with an deal of spikiness like that of some weird starfish.

TO SAVE OLD TYPES.

Perhaps there are some skilful and long-sighted growers who could make a very shrewd guess as to the next direction in which Dahlia fashion will be guided; but it will be a pity if some of the best results achieved with the old-fashioned double and single kinds are lost. When fashion begins to play fast and loose with any varieties of cultivated plants we scarcely notice when a valuable, but tempo-

rarily neglected, type disappears beyond recall. In our craze for new varieties we are in constant danger of losing old-fashioned types, which are well worth preserving for their own sake as well as for the memories that linger round them. Of Dahlias especially there are many which deserve to be rescued from the extinction which now threatens them, and we can all do something to this end by insisting upon retaining a few old sorts that we like by the side of more modern creations. They will not always suffer by comparison.

E. K. R.

TREES AND SHRUBS.

VERONICA HULKEANA.

THIS shrubby Veronica, whose home is in the mountainous portions of New Zealand, is, without doubt, the most beautiful of its section. In the late spring a plant such as that shown in the accompanying illustration, which occupies a wall space of 4 feet by 4 feet, is a lovely picture, being covered from its highest point to the ground level with long, branching flower-panicles of a delicate lavender colour, which render it when in full bloom the most attractive plant in the garden, and one that rivets the attention of every visitor. As I was leaving home in a few days I cut all the flower-sprays when at their best, and found that they numbered just over a hundred, the longest of which measured slightly over 18 inches. It is totally distinct in appearance from all other shrubby Veronicas, and to my mind far exceeds the most ornamental of these in loveliness. Its natural habit is to form a loose-growing bush, but when grown in the open it is always safer to train it to a wall on account of the protection it receives when so planted. Exceptionally charming as is this plant, it is but rarely seen in gardens, and I know few, even in the genial south-west, which contain it, a fact that has always been a puzzle to me. Though generally deemed tender, I have found it far harder than many others of the shrubby section, and I have seen these very badly injured by frost in a garden where *Veronica hulkeana* is grown while the latter was quite unharmed, and for this reason I should advocate its being tried in the open, on south walls, anywhere in the southern counties. The one drawback to *Veronica hulkeana* is that large plants often die in an unaccountable manner, generally after flowering. Possessors of fine specimens who are aware of this fact are therefore on tenter-hooks during the summer lest their favourite should show signs of failing vigour, for the loss of a large plant of this *Veronica* deprives the garden of one of its most beautiful objects in the latter days of May. If the flower-sprays were cut immediately they reached their prime the drain of seed-bearing would be spared the plant, but that this would not ensure its continued health may be gathered from the fact that large examples which have flowered and borne

VERONICA HULKEANA IN THE SOUTH-WEST.

seed in perfect health for years have ultimately died. Cuttings 4 inches to 6 inches in length, taken off with a heel in the early summer, strike readily, and plants are also readily raised from seed, but it takes a long time for a cutting or seedling to rival the proportions of a fine specimen which has died; however, both are pretty even in their early stages of growth, as they commence to flower when quite small. In the colder districts *Veronica hulkeana* makes a charming greenhouse plant. The finest example that I have seen in the open covered a wall space of 6 feet by 6 feet, but I have heard of even larger plants. S. W. FITZHERBERT.

THE ROBINIAS.

THE Robinias are represented in this country by four species and from twenty to thirty varieties, practically all of which are handsome trees suitable for large gardens, while a few are smaller growing and for small places. The species are all natives of North America, and are thoroughly hardy in this country, succeeding well almost anywhere, as also the varieties, though all require attention in the matter of staking while young to prevent damage from high winds.

R. hispida (the Rose Acacia).—This is properly a large shrub, though it is sometimes grafted standard high to form a small-headed tree; but this form of growth is unsuitable to it, as no hardy plant gets damaged so quickly by high winds as this Robinia and its variety, both of which, however, make excellent wall plants, and run no risk of being broken to pieces if a wall can be spared for them. *R. hispida* is a fairly rapid grower when once established, and makes long brittle branches, which are sometimes broken by the weight of the leaves and flowers. The stems and young shoots are clothed with long, bristly, reddish-coloured hairs, which give the plant a character easily recognised. The leaves are pinnate, about 1 foot in length, and consist of eleven to fifteen large oval leaflets. The rose-coloured flowers are in long, drooping racemes, opening about the end of July, and continuing in flower for a considerable time. *R. h. var. inermis* differs from the type in its longer leaves with smaller leaflets, its deeper and more brightly-coloured flowers, and smooth wood and branches, though a pair of small spines are usually found at the base of the leaves. These two are usually met with under the names of *R. rosea*, *R. hispida rosea*, or *R. macrophylla*, the names being given to either as the fancy arises. They are usually grafted on stocks of *R. Pseudacacia*, but a better method of propagation—though a more tedious one—is by layers. I believe that seed-pods of these plants have never been seen, not even in a wild state.

R. Neo-mexicana.—This is a vigorous species that will probably make a large, handsome tree in course of time. It is comparatively new in this country. The leaves are pinnate, consisting of about twenty, entire, oval-shaped leaflets, of a bright green above, and paler, almost glaucous, beneath. The branches have a pair of stout, sharp spines at the base of each leaf, and pointed at right angles to the direction of the leaf. The flowers are bright pink, and freely produced on fair-sized trees in drooping, clustered racemes. This plant seems to do fairly well when worked on *R. Pseudacacia*, but seeds can be obtained without much difficulty, and should be employed for propagating it whenever possible.

R. Pseudacacia (the Locust Tree or False Acacia).—This is a well-known tree in nearly every part of the country, a specimen of it being a feature in almost every parish. It deserves cultivation for the sake of its long racemes of white, scented flowers, but the wood is also valuable, being hard, close grained, and easily worked. There are a great many varieties of this, a selection of which is as follows: *Var. aurea*, with golden foliage and free, graceful habit; *var. bessoniana*, a vigorous grower with pink flowers; *var. crispa insignis*, the leaves of which are curiously curled, quite distinct from the type; *var. decussata*, with bright rose-coloured flowers; *var. fastigiata*, which has the upright habit of a Lombardy Poplar; *var. inermis*,

a spineless form, which grows into a small, round-headed tree without any pruning, and is used largely, almost too much so, in villa gardening; *var. microphylla* or *elegans*, with small Fern-like foliage and robust habit; *var. rozynskiana*, a comparatively new form, the leaves of which have a purplish tinge, and are upwards of 3 feet in length; and *var. semperflorens*, which is more or less in flower all through the summer. There are many other varieties, but the above selection will be found satisfactory. These varieties all do well when grafted on stocks of the parent plant, which can itself be easily increased by seeds, suckers, or root-cuttings.

R. viscosa (the Clammy Locust).—This makes a smaller tree than the preceding, has a roughened gnarled trunk, and reddish coloured branches and leaf-stalks, which are also covered with a thick, glutinous substance. The leaves are pinnate, and the flowers rose-coloured, nearly scentless, and crowded in thickened, oblong racemes. It can be propagated by seeds, suckers, or root-cuttings. The Robinias are practically indifferent as to soil, but young plants should not be treated too well, as this tends to rank growth, which suffers from high winds during the time the foliage is on the plants. Bagshot, Surrey. J. CLARK.

RAISING ANEMONES FROM SEED.

WITH regard to this I have observed a peculiarity to which I wish to draw the attention of your readers; perhaps it will save disappointment to others who, like myself, have hitherto been ignorant of the fact.

I have repeatedly endeavoured to raise *A. alpina* and *A. sulphurea* from seed, sowing the seeds directly after they were ripe, and each time seedlings came

ANEMONE NARCISSIFLORA SEEDLING.

up quickly and well, but remaining tantalisingly long in the seed-leaf state; they eventually, without pushing true leaves, one after the other turned black and disappeared (as I then thought through overhead watering with rather hard water). As the seedlings had come up and had, to my mind, "damped off," I naturally did not keep the pots any longer. Last year I tried again with the same result; the pots, however, had been snowed up early and remained plunged with the rest in the frame, when, to my surprise, there appeared in spring some true *Anemone* leaves in each pot.

Two seed pots of *A. narcissiflora* which I had kept over from the time of sowing in the autumn of 1901 (knowing this species to be very slow in coming up), have now revealed to me the process which takes place. During the hot weather of last March several hundred seedlings came up in these two pots; they remained in the seed-leaf without any sign of budding leaves between the cotyledons up to the end of June last, when I went on a four weeks' holiday.

On my return home I found that the cotyledons, in spite of the treatment all the while with the same hard water, were still of a healthy green colour and "barren" as before, but there came

from out of the mould (independently from, but close to the stalk of the seed-leaf), the true leaves on about a dozen of seedlings, so that I hope to see the whole of them a success.

The conclusion to be drawn from this seems obvious enough—seeds of *A. alpina* and *A. sulphurea* which were sown in, say July, send up their cotyledons merely to nourish the roots while descending to the proper depth, in order to form the underground bud from which anon the new plant is to spring, hence the long and apparent inactivity of the seedlings. After this bud has been formed, and thus the destiny of the seed-leaves fulfilled, they become superfluous and die off. By this time, however, the season having become too far advanced for the bud to push, it remains dormant until genial spring calls forth active life to form the new plant. *Anemone narcissiflora* having germinated in early spring found time enough to complete the process without interruption, its seeds having rested dormant in the ground longer in their turn by way of compensation.

Of other *Anemones* I have only had experience of *A. vernalis*. This, when sown directly after seed is to hand, comes up quickly within a few days, and as quickly in succession follow the first leaflets. By the autumn plants that look strong enough to flower in the ensuing spring have developed, though whether they do so I am not prepared to say, as hitherto I have only planted collected stock. *A. vernalis* is a lovely flower and never fails. Planegg, Bavaria. ED. HEINRICH.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

CYTISUS ANDREANUS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I was glad to see that Mr. Burrell has drawn attention to his failures with this shrub, and I am pleased to add my experience. I lost my first plant; it was grafted, and no doubt on the stock spoken of by "H. F." on page 65. I obtained another much dwarfed, and I presume it was from seed. This has grown vigorously, and from it I resolved to save seed, hoping to get some more of it. Several seedlings appeared, and, oddly enough, at the end of three years they all bloomed, but to my astonishment only one of them proved to be *andreas*. This shows that it is very apt to revert to *C. scoparius*, but I prefer this to having grafted plants. *C. andreas* is most charming when grown as a bush close to the ground. It is ugly and unnatural on long stems. Chard. J. CROOK.

EARLY PEACHES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In a recent issue of THE GARDEN Mr. Wythes makes some comment on the comparative value of different early Peaches, a subject always interesting to fruit-growing readers. "Alexander," Mr. Wythes says, "has been discarded in favour of Waterloo, because of its bud-dropping propensities." On reading the note in question I was somewhat struck with the preference for one of two habitual bud droppers. I have grown both varieties—at least they have been planted under these names, and though they differed slightly in general characters, they both seemed alike in the matter of shedding the buds in winter. So regularly did this happen that a tree of each in our early house had to be removed. In another cold house, Waterloo at the present time fails each year to give a full crop, though the buds do not drop so badly as when forced, still the tree loses a deal of value by reason of this failing.

Outdoors they fruit most regularly and freely—too freely, in fact—and for an early crop nothing better could be wished. Amesen June under glass is much more to be depended upon; the colour of this Peach is equal to Waterloo or Alexander, and

When well grown, and not overcropped, the size is good also. While so many complain of these bud-dropping traits, there are some who stand by Alexander because it gives heavy crops of handsome fruits under any conditions, forced or otherwise. It is somewhat difficult to give a reason for this uncertainty, but soil, structure, and elevation must have some considerable controlling influence. Though faulty constitution is usually attributed to these American Peaches, I have never yet heard a satisfactory solution given why Alexander should drop almost every bud, while sorts like Grosse Mignonne or Royal George, for instance, growing in the same house, should develop flowers and fruit without loss. Hale's Early with some is almost as bad as Alexander, but with others it is a very reliable Peach. I am at one with Mr. Wythes in giving Condor a good name and recommendation. It sets very freely, is of good medium size, and its quality first-rate.

W. STRUGNELL.

NEGLECT OF THE VERBENA.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—In view of the increased interest taken in Verbenas of late, a perusal of the list of plants certificated by the Royal Horticultural Society between the years 1859 and 1899 is very interesting, as showing the gradual decline of these charming flowers. In 1859 two varieties were honoured, then in the sixties the number had increased to seventy-two, the next decade saw a drop to thirty-two, the eighties witnessed a further decline to eighteen, and, lastly, from 1890 to 1899, only two were recognised by the floral committee. The awards were in most cases either first or second class certificates, as the award of merit is of recent introduction; in fact, the first Verbena upon which this was bestowed was in 1890. Recent interest in Verbenas has been undoubtedly a good deal stimulated by the variety Miss Willmott, which, apart from its value for bedding purposes, has been taken in hand by some of our large market growers, who turn out large quantities of perfect little specimens, each carrying numerous large heads of rich pink blossoms, and all grown in the regulation 4½-inch or 5-inch pots. The scarlet variety Warley, recently shown by Miss Willmott, bids fair to be a good companion to the other.

H. P.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—I am one of those who, happily, have never quite given up the culture of the Verbena. For a number of years I grew the old selfs, e.g., scarlet, blue, white, and purple. My experience, however, with them is this: In common with almost every garden plant which has to be propagated by means of cuttings, a change of stock is absolutely necessary in course of time, and this I find to be most difficult to obtain. As your correspondents point out, the Verbena, or at least the named sorts, has been very much neglected, and I fear that such beautiful varieties as Defiance, Emperor, Blue King, Avalanche, and other equally beautiful have gone for ever. A friend who was my neighbour for a number of years once grew some of these, but I fear they have now gone too.

I quite agree with your many correspondents respecting the "coddling." A fairly dry cold frame where the frost can be kept out is all that is required for them during the winter. Last winter Verbena Miss Willmott kept perfectly healthy in a frame built against a house with a south aspect. What one has to guard against is a dry, hot atmosphere; this will soon ruin Verbenas. Thrip and greenfly will attack them, and all the dipping and fumigating one can give will not save them. The Verbena likes a cold and not too dry atmosphere during winter. In spring a little more heat will cause it to produce plenty of healthy cuttings,

BROWN TURKEY FIG IN THE CHANNEL ISLANDS.

which soon root in a mild Cucumber frame. But cuttings from stunted plants will be difficult to root, and rarely grow freely.

G. A.

THE FRUIT GARDEN.

FRUIT CULTURE IN THE CHANNEL ISLANDS.

FRUIT culture in the Channel Islands has been of long and steady growth, although at times its development has been startlingly rapid. In the remote past the culture of Apples for Cider, largely for export, was an important item with the Channel Island farmer. This has been steadily declining, Cider orchards in more recent times having been ruthlessly cut down, and the land cleared for early Potato culture. This for a time certainly held out better prospects, but this, in its turn, has changed for the worse. Many who read of the vast export of fruit, vegetables, and flowers from these islands are surprised at its volume, and visitors who witness the long stream of carts and vans laden with produce wending their way to the quays are astonished that such little patches of land, well and carefully cultivated, can send so much to the mainland markets. Nearly every Channel Islander is, more or less, born with a taste for soil cultivation, and takes a most intelligent interest in the industry of the islands. This has proved to be to their great advantage, and we believe if a like spirit existed in England and Ireland, and if such a spirit were encouraged, England would be better supplied with home produce than she is at present, and considerably less money by many millions would annually be paid for foreign produce.

Figs have always been largely and well grown in the Channel Islands, in the first instance, of course, in the open air, before we exported fruit. In those days large trees were trained flat over a wooden framework, varying in height from 4 feet at the front to 6 feet at the back. Many of these trees are still grown for supplying fruit in its natural season. When forcing came into favour many of these large trees were covered with glass, and in some instances pipes and boilers were employed.

The increase of profit was of course very great, but many of the trees so treated died after a few years. This, no doubt, was largely caused by lack of water during the winter and early months of the year. A few large trees which would now be valued were actually cut out owing to prices falling for a time.

Some old trees under glass, however, are still doing well. But the new grower now generally grows pot plants, or small trees planted on the floor and trained over the roof. In the latter case root-pruning is found to have excellent effect in restricting excess of vigour. Generally speaking, the crop may be looked upon as profitable. Figs are still not generally liked, however, so that it would probably be easy to glut the market. It certainly would not be wise for a grower to go in too largely for Fig culture. Many varieties have been tried, but Brown Turkey alone appears to meet with general favour. It is found to be the most reliable and productive.

A CHANNEL ISLAND GROWER.

GARDENING OF THE WEEK.

FLOWER GARDEN.

PROPAGATING.

ALTHOUGH many of our bedding plants have made slow progress this season, it is quite necessary that their propagation should now be taken in hand if strong young stock is to be had for wintering. It is far better to lay in a stock now than to depend on forced plants in early spring; then work comes in with a rush, and it is almost impossible to give these due attention at that busy season.

ZONAL PELARGONIUMS.

The propagation of these should now be proceeded with. I do not suggest that a complete raid should be made on the beds, but there are many young shoots that can be taken off without making much difference to the general effect, and the removal of which will help later growths to develop. Cuttings in the open ground will now strike freely and develop excellent plants. When potted up in the early part of October they make

strong plants from which a useful lot of flower may be taken until, and sometimes after, Christmas, but on the whole I think the most economical way is to use boxes for them; there will then be no necessity to disturb them again until they are boxed or potted off in the early spring. A fair amount of drainage material well covered with some of the more fibrous portions of the soil should be used to prevent the soil becoming sour. A considerable quantity of sand should be mixed with the soil also. If the cuttings are very sappy they should be exposed to the air for an hour or two before being inserted in the soil. Avoid overcrowding in the boxes, give a thorough watering, and then stand the boxes in the open, giving them the advantage of full sun. Here they may remain until frost makes it necessary to put them under cover.

ANEMONES AND RANUNCULAS.

These will now have done flowering. Lift the tubers and store them away until planting time comes round again. Many of the failures we hear of in their cultivation are due to not giving them a season of real rest and ripening.

T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

THE FRUIT GARDEN.

STRAWBERRIES.

YOUNG plants that have been recently shifted from small 3-inch into fruiting pots may be removed from partial shade to a light, open spot, free from worms, and within easy reach of water, of which they will take liberal supplies, until the time arrives for storing them away for the winter. In placing the early sorts, which generally occupy small pots, the latter may be made to shade each other from the direct rays of the sun until the foliage requires more room, when every alternate plant may be taken out, or, better still, all may be turned out and rearranged to prevent their rooting in the bed. Until now the weather has been more favourable to the production of runners than the formation of good ripe crowns; so much so, that a thousand 7-inch pots filled and placed on a nursery bed in this garden are now half filled with roots and occupying their summer quarters, never having been watered with the hand. If the weather still continues wet and unfavourable, all the plants must have full exposure to light and air by being placed in rows on planks, platforms, or low walls, as it is in every way better to have a few

WELL-RIPENED PLANTS

than to swell expenses by wintering a great number than can be properly grown and tended through the summer. When the potting of the forcing plants is brought to a close, provision must be made for another year by planting out the surplus runners before they begin to suffer from confinement in the small pots in which they have been layered. In the selection of a site the first consideration should be light and air, as plants which are shaded and drawn cannot be expected to produce good runners. Next comes the soil, which should be well prepared by the use of manure and deep trenching, and if a little new heavy calcareous soil can be placed round each plant the labour will not be thrown away. If, in addition to the foregoing conditions, a situation near water can be selected, its importance should not be overlooked. Growers who have not been in the habit of exchanging runners with distant friends and neighbours will do well to try the experiment.

CUCUMBERS.

Where the Cucumber house proper is devoted to Melons in summer, the raising of young plants must be regulated by the time it is likely to be ready for their reception. A manure pit or frame with fermenting material for giving bottom-heat is the most suitable structure for raising and growing the plants in, as they can be kept near the glass until they are large enough for shifting into the fruiting pots. Immediately after the Melons are removed clear away all the old soil and plunging material, thoroughly cleanse the walls, wash the glass, and paint the woodwork if necessary; then

fill the pit to the usual level with fermenting leaves, plunge the fruiting pots and introduce the compost, but defer planting until the heat of the bed has subsided to 90° and the soil is thoroughly warmed through. If due attention is given to early closing with solar heat and moisture, and the bottom-heat is kept up, the firing of houses now in full bearing may be discontinued. Dress the plants three times a week, and avoid overcrowding by stopping at the first joint beyond the fruit and by the removal of a few of the old leaves.

Madresfield Court.

W. CRUMP.

THE INDOOR GARDEN.

PELAGONIUMS.

CUTTINGS of the show varieties should be made from the well-ripened wood of the current season's growth. Select for this purpose the best cuttings from the most favoured varieties, and insert them in small pots filled with sandy soil, which should be placed in a cold frame exposed to plenty of light, and kept somewhat dry; except in very bright weather no shade will be required.

KALOSANTHES OR ROCHEAS.

Coccinea is a very useful plant for late summer work when flowering plants are less numerous than at an earlier period of the year, therefore any old plants now passing out of bloom and that have become leggy should be used for propagating. Cuttings from unflowered shoots strike readily in sandy soil in small pots placed on a shelf in a cool house or in a dry, cool pit. These are very impatient of too much water at the root, therefore a little extra care in watering is necessary. *R. falcata* produces very showy corymbs of bright orange-red flowers from July to September, and is best treated as a greenhouse succulent.

TREE OR PERPETUAL FLOWERING CARNATIONS should be layered at once; these are best treated after the manner of Malmaisons. For cut flowers this is the most useful section of Carnations we have, and, as they may be had in bloom practically all the year round, it is desirable to work up a large stock; for general treatment, the hints given for Malmaisons may be adopted.

MIGNONETTE.

Where pyramidal plants are intended to be grown, select the strongest plant in each seed pot and support it with a small stake, at the same time weeding out all the remaining plants. For this method of cultivation a greenhouse is more convenient than a pit. When the leading shoot sets a flower-bud remove it as soon as discovered, and train up the succession shoot in like manner to the first until the desired height is attained. Encourage the side shoots by removing all flower-buds as they appear, and as the pots become full of roots repot them into 8-inch pots, which are large enough for plants 2 feet or more in height. For flowering during the winter make another sowing in 5-inch pots, and as the seeds germinate keep them near the glass in a light, cool, airy house.

VALLOTA PURPUREA.

This is a good time to lay in a fresh stock of bulbs, which should be potted in fibrous loam, leaf-soil, and sand; in potting keep the bulbs 3 inches or 4 inches below the surface of the soil, and place a handful of sand immediately round the bulb, which requires to be potted very firmly, so that it is best to allow them to remain in the same pot for several years.

Wendover.

J. JACQUES.

CHRYSANTHEMUMS.

TAKING THE BUD.

PLANTS which are intended to produce exhibition blooms during November should have been so timed as to have their buds formed during August or the first ten days in September. All the large Japanese varieties should be the first to secure, but many of the incurved sorts are best taken during the early part of next month. This operation requires to be done with much care, as the slightest injury to the main bud which is intended to make

the flower will cause serious defect later on. The surplus buds are best removed during evening or early morning when the growths are fresh and stiff, and a small pointed stick is best for the purpose, holding the point of the shoot firmly with one hand while the small buds and shoots are being manipulated. In the case of strong plants it is best not to be too severe on the first thinning, but to leave one or two shoots near the bud for a few days, which does much to prevent coarseness and hard centres. Feeding should be withheld for a few days; it is a serious mistake—far too often made—to gorge the plants with manure while they are setting their buds and immediately after they are selected.

SURFACE DRESSING.

It is a capital plan towards the end of the month to give all the plants a good dressing of fresh material. The fresh mixture should consist of two parts finely chopped turfy loam, two parts half-decayed horse or cow manure, and a small portion of bone dust added. This must be used moderately dry, and made very firm with a potting stick. Much care will have to be exercised in watering after this has been added or one may be deceived very easily. Thoroughly test the plants both by tapping and weighing them.

TIING THE GROWTHS.

At this season we often experience severe gales, and unless the growths and plants are made very safe serious results are often experienced. Extra lengths of cord should be stretched from post to post, and each plant securely fastened to it, as a strain on a well-grown row of *Chrysanthemum* during gusty weather is very great. Each growth also should be made safe. Some varieties are very much more brittle than others, and unless special means are taken to preserve them most of the points will be broken. I know of no better way to make these safe than to tie Bamboo tips about 2 feet to 3 feet long to the young shoots, using broad pieces of bass for the purpose, and tie the tip of Bamboo to the top line of cord.

INSECT PESTS.

At no season of the year does insect life do more damage than now. Among the most troublesome are the earwig, white thrip, and jumper, consequently a sharp look out must be kept for these, and means taken to eradicate them. Earwigs can be easily trapped, as before advised, with Bean stalks; the plants should also be looked over for them during evening with a lamp. The insect generally known as the jumper does considerable damage in some seasons by piercing the buds when quite small. These must be crushed between the thumb and finger, but are very troublesome to catch. Thrips often do much mischief before being detected; they secrete themselves in the point of the shoot, sucking the life out of it. They have a particular liking for some sorts, especially the Queen family. Thoroughly syringe out the plants with some reliable insecticide—quassia chips, tobacco water, and soft soap made fairly strong is both safe and effectual if persistently used two or three nights in succession. Give the foliage a good dusting of black sulphur on the under side once a week to prevent mildew, and thoroughly syringe the plants on all fine days in early afternoon.

E. BECKETT.

Aldenham House Gardens, Elstree, Herts.

KITCHEN GARDEN.

WINTER GREEN CROPS.

THE dull rainy weather we have experienced since these were planted out has been conducive to extraordinarily rampant growth. What the plants now want is plenty of sun to solidify that growth in order that when wintry weather comes they may withstand it without injury. Brussels Sprouts that have grown strong and are wanted for early pickings or for exhibition should have a rough stake placed against each plant and be tied; this will prevent injury from storms and winds.

CAULIFLOWERS.

In cold districts some seed should be sown at once for wintering in frames for producing heads

when planted out in April. Many gardeners now depend upon plants raised from seed sown in heat early in the year for the earliest supply, and doubtless the system answers almost, if not quite, as well as the older one in certain districts, but in others it does not. In milder localities the 23rd of the month will be found early enough. Sow on a warm border in an open position that the plants may obtain full light. Cover the bed with mats until germination takes place. When the first rough leaf has developed prick out in soil that is not too rich in a cold frame. Keep close and shaded from the hottest sun for a few days to re-establish them, then give all the light and air possible until sharp weather sets in.

PARSLEY.

Another sowing may yet be made for protecting in frames for late winter and early spring use. This sowing may either be made in a prepared cold frame or on a warm border in the open, and when bad weather sets in place a frame over it. The latter method answers well in warm localities, but I advise the former for the north and in damp districts. Any old frame will do for this crop, provided the glass is in good order for throwing off cold rains and snow, which are more harmful than actual frosts. Some rough brick rubble should first be thrown in to form drainage, and over this place a layer of rough stable litter. Then fill up to within 6 inches of the glass with fairly rich soil; this must be trodden and raked level and the seed sown thinly in drills 6 inches apart. Keep the frame close and dark until the seed germinates, and when the seedlings attain 1 inch in height thin out to 4 inches apart.

TRIPOLI ONIONS.

Sow seed of such well known sorts as Giant Rocca and Golden Globe to stand the winter. A plot of ground that has carried a not too exhaustive early crop will do for these. Dig deeply and afterwards tread, roll, and make level. Draw drills 18 inches apart and $1\frac{1}{2}$ inches deep and sow thinly. *Stoneleigh Abbey Gardens.* H. T. MARTIN.

CANTERBURY BELLS AND THYME.

IN THE GARDENS OF HEWELL GRANGE, REDDITCH. THE accompanying illustration shows well how beauty and utility may go hand in hand in the garden. The vegetable garden, if not useful, is, of course, valueless, therefore the crops it produces must first be considered. It need not, however, be unattractive, as the appearance of many a kitchen garden nowadays can testify. There are many ways of imparting interest and beauty to this part of the garden, and there are few that are better than that illustrated. Thyme makes a charming edging to the walk, and apparently enjoys its position, while the Canterbury Bells behind more than pay for the space they occupy. The photograph was taken in the kitchen garden at Hewell Grange, near Redditch, the Worcestershire residence of Lord Windsor. Mr. A. A. Pettigrew is the head gardener. There is no reason whatever why the vegetable garden should not be made a pleasant place when good taste is exercised, and the borders in it can be regarded as a "reserve" garden for cutting from for the house, to save those in the more conspicuous parts being interfered with. In such a border as the one shown many useful flowers can be grown and cut freely from in their season—Sweet Peas, Canterbury Bells, and so on. H. T.

THE KITCHEN GARDEN.

A USEFUL SPRING VEGETABLE—GOOD KING HENRY.

MANY vegetable growers will probably think the above name for a spring vegetable a peculiar one. Probably it is local, as I have heard it called Lincolnshire Spinach and Asparagus, but botanically it is known as *Chenopodium Bonus Henricus*. It is a perennial, a native of this country, but is found in many parts of Europe, though not in a cultivated state. At the same time it is an excellent spring vegetable and of simple culture, and its good eating qualities should make it more generally cultivated. I have never seen it growing much farther north than Lincolnshire, where in this and adjoining counties it is a general favourite, but mostly found in small gardens. In the county named it is usually grown in one corner of the garden, and the green shoots are the edible portion. Its season is from April till June. The plants begin to grow, if in good soil and a sheltered position, in March, and cutting is general in April. The young shoots are cut and tied in bunches like Asparagus, and the best produce is that cut as low down in the soil as possible, though in the county named the growths are often much larger, and only the top or green portion is used, much the same as ordinary vegetables. The plant grown in good soil produces shoots not unlike good Asparagus as regards size, and it is cooked in a similar way and served on toast with melted butter. When the growths are more advanced they are best cooked as a green vegetable. The culture as described is simple; indeed, in the county named a bed is made every few years. The plants are divided just before growth is active, and if the treatment is generous there will be a good return in the shape of shoots superior in size to those left to grow as they like. A simple method of culture is by seed. Sow the seeds early in the spring, in deeply dug land well manured, in rows, 2 feet between the rows and half that distance between the plants. Thinning should be done early, and the plants transplant readily if sown in a seed-bed, so that if only a few plants are grown the last named may be the best method of culture. If the shoots are allowed to get old remove the outer

covering from the base to the tender part, but I think it is much better to cut the shoots when quite young if cooked in the same way as Asparagus. For amateurs' gardens this would be an excellent vegetable, requiring so little attention and giving a good return at a season of the year when green vegetables are scarce.

G. WYTHES.

WINTER SPINACH.

THIS is amongst the most important and useful of winter vegetables, so much so that it is in constant demand. It is difficult in some gardens to keep up the supply, and in many the plants go off at the beginning of the year, while in some old garden soils they refuse to grow satisfactorily. I have observed that in new soil the crop is far better. Another difficulty in its culture is to regulate the time of sowing so as to get plants of the right size, for I have proved many times that when they are too large and severe frost comes they die off just above the ground line. Upon examination I have found that the stems were hollow, the frost freezing them through. This being so for years I have tried to get a hard, solid stem. To do this it is somewhat difficult, as much depends on the nature of the soil, time of sowing, and the season. As our situation is low this evil is increased. I try and obtain a not too forward or coarse plant, but with a hard, solid stem close to the ground. Garden soils are too quick and result in too rapid a growth, but in open fields it is just the reverse. This is why the Spinach crop is often better in fields than in gardens.

The slug is one of its worst enemies, and in the west and on wet, heavy soil the pest is abundant. In selecting a position to sow seed on I chose an open one, and on land that is not too exposed. If it should be loose then it is trodden quite firmly, similar to preparing for an Onion crop. It is difficult to lay down any hard and fast method, as circumstances differ considerably. In our garden I have found land that has been used for early Potatoes sufficiently solid. Our best results have been from sowing where Strawberries have been, not digging or opening it in any way, but simply hoeing over deep enough to draw the drills. Occasionally I have used ground from which autumn-sown Onions have been cleared with good results, this promoting a firm growth.

With regard to manure I make a point of having

CANTERBURY BELLS AND THYME IN THE GARDENS OF HEWELL GRANGE, NEAR REDDITCH, A RESIDENCE OF LORD WINDSOR.

some fresh ashes made from the rubbish heap and mix burnt earth with it. It is essential that it should be put on the land dry, seeing much of the value of the wood ashes is gone when wet. When the seed is sown and lightly covered in this preparation is thrown over the land; it fills in the drills completely, and provides a coating of it for the plants to come through. It acts in two ways, first as a stimulant to the soil and wards off the slugs. The rough bits of charcoal in the ashes make it difficult for the slugs to crawl over. Where there is no charcoal in the ashes we throw a coating of cinder ashes over them.

Sowing time is important. I usually sow on three occasions, as the seasons differ considerably. Our first is at the end of July, again about the middle of August, and thirdly at the close of the month. Should the autumn be early then the two first periods are the best, but if very mild the growth from the first sowing is too coarse and worthless. I have sown the first week in September, but do not recommend it. Always make the soil fine.

Forde Abbey.

J. CROOK.

NOTABLE GARDENS.

CHEDINGTON COURT, DORSET.

OFTEN the most attractive and interesting gardening is to be found in places of moderate size, and there one often finds the most ardent plant lovers. The garden now under notice has a good claim to be placed in this category. Although it has been my pleasure to visit a good number of gardens, seldom have I seen a more attractive one than this, both from its situation and the plants it contains. The Western Counties are famed for their hills and dales. Chedington stands on a hillside about four miles from Crewkerne and overlooking that town, and near Merriott, once known so well in connexion with John Scott, the great fruit authority, some thirty to forty years ago. Standing at the entrance lodge, the view over this fertile valley is magnificent, with the Quantock and Mendip Hills in the distance. The Taunton vale is famed for its wonderful soil and productiveness.

On one side of the entrance drive the park, which is finely wooded, slopes away to the village of South Perrott, and on the other side is a lawn upon which is planted a collection of standard Thorns. Among others I noticed varieties of the Cockspur or *Crus-galli*, *tanacetifolia*, and many more. Few things are more ornamental than aged Thorns when well placed, as they are here. Portions of the walls of the mansion are covered with choice climbers and shrubs. I noticed that the walls were not disfigured by nailing, but neat wire trellis was used to train the plants upon. On the west and south the land slopes, allowing one to obtain grand views of the naturally beautiful grounds.

Around both these sides is a terrace several feet high, and, although only of modern erection, the walls are being fast covered with many choice plants, such as Tea Roses, Escallonias, *Jasminum revolutum*, Clematis, and *Benthamia fragifera*. In one of the sheltered corners at the foot of the terrace wall I found at the time of my visit (end of June) the lovely *Carpenteria californica* in bloom. Although not a large specimen, it was in the best of health, and had many of its large white blooms still to open. Just below the south terrace is a small well-kept formal garden. In spring it is planted with bulbs, &c. The background of shrubs contains *Choisya ternata*, golden and silver Weigelas, large groups of *Deutzia scabra*, with one or two of the better Bamboos. On one of the grass slopes I was told that *Chionodoxa* thrived amazingly and made quite a sheet of blue in spring.

The pleasure grounds are not extensive, but contain many types of ornamental gardening. Here may be seen Roses in many forms. An arch connecting two trees cut down was very fine, simply a mass of single claret-red blooms. Other

free sorts were used in various positions with equally good results. Hard by grows a large plant of *Buddleia globosa*, with other shrubs behind showing up the orange-coloured blooms in a very striking manner. It is in such a process that bright flowering shrubs are seen to the best advantage.

Around the lake are to be seen many moisture-loving plants, and close to and running down to the water is a mass of Spanish Irises, their many coloured flowers rising out of the somewhat long grass making a choice bit of colour beside the water. Opposite this, on sloping ground, are some informal Rose beds, containing both Teas and Hybrid Perpetuals, with large plants growing up supports and over arches in full bloom behind. The best Penzance Briars and the Austrian Copper were well represented.

In another position near the Rose beds I noticed a large semi-circular bed containing many of the best hardy perennials. Delphiniums, Pyrethrums, Irises, &c., were in bloom, with numerous other plants to succeed them. What impressed me most was the absence of shades one so generally sees in this kind of gardening. Added to this, the arrangement was not of the usual kind. There were tall plants at the back, and the beds gradually sloped towards the front. Bulbs were planted among the tall things. This prevents those large bare spaces between the late-blooming plants, as the flowers fill them in spring, and the foliage of the bulbs has ripened off before the growth of the late perennials needs the space. Added to this, the formal outline is destroyed, and no portion of large beds of hardy plants could be said to be devoid of colour at any season of the year.

The water from the ornamental pond runs in an open stream for a considerable distance, and this is taken advantage of. Rocks and large stones have been placed on either side, and among these were planted a fine collection of hardy Ferns, *Spiraea plumosa*, and other tall-growing plants, also *Choisya ternata*, dwarf *Rhododendrons*, and polyantha Roses. In small nooks near the water were many moisture-loving plants.

At the time of my visit a very large plant of *Geranium arvense* was in full bloom, making a glorious piece of colour. At the top of the slopes the stones are so placed as to provide a home for many beautiful *Campanulas*, *Dianthus*, &c.

During the past few years a large piece of ground has been taken in from the park, adding much to the beauty and affording space to extend the natural gardening which the owner delights in.

In a somewhat shady spot I saw a fine group of *Lilium szovitzianum* nearly in bloom, many feet high and in the best of health. Mr. Birkenshaw told me it bloomed well last year. *Anemone robinsoniana* flowers well here, *Iris sibirica*, *Trollius*, *Saxifragas*, and a host of other things are thriving in the new grounds. It would be difficult to name a tithe of the beautiful things to be found in this most interesting garden. Turn in whatever direction you may you see things to interest, thus showing that the owner, Sir Henry Peto, Bart., is a true lover of his garden, and derives much pleasure from it. Nor must I omit to say his wishes are ably carried out by his gardener, Mr. H. Birkenshaw, who has had charge of the place about three years, and, although young, has had experience in some of the best schools of gardening. The kitchen garden, glass houses, and fruit garden are managed in accordance with the requirements of the place, to provide material for a small conservatory adjoining the mansion, and to afford out flowers, forced fruit, &c.

JOHN CROOK.

RECENT PLANT PORTRAITS.

The August number of the *Botanical Magazine* contains

Isoloma erianthum.—Native of Colombia. This is also known under the synonyms of *Gesnera eriantha*, *Brachyloma erianthum*, and *Kohleria eriantha*. A very handsome and free-blooming Gesneriad, with numerous pendulous tubular red and white flowers.

Sedum Stahlia.—Native of Mexico. This is a

curious member of the Stonecrop family with yellow flowers.

Chlorea longibracteata.—Native of Chili, the known as *Asarca sinuata*. This is a beautiful terrestrial Orchid, with a spike of white flowers resembling one of the *Satyria*.

Arisema japonicum.—Native of China and Japan. It is also known as *Arum Dracunculoides*. *Arisema latiseotum*. This is a plant of much botanical interest and little or no beauty. It has green flower spathes veined with white.

Cistanche violacea.—Native of Morocco and Algeria. It is also known as *Phelipaea violacea* and *Orobancha Phelypea*. This is a most curious and handsome-flowered parasite. It is found in the Algerian desert, growing straight out of the sand where it is brackish. The colour of the flowers as depicted in the plate is said to be possibly not quite exact, in consequence of deterioration of the specimen figured in transit to Kew.

The first part of the *Paris Revue Horticole* for August figures

Tacsonia manicata.—A most beautiful variety, which is indigenous to Ecuador and the Cordillera mountains, whence it was introduced by Monsieur E. André. It has medium-sized flowers, with scarlet ray petals and an azure centre. It is said to be very free flowering.

The August number of *Revue de l'Horticulture Belge* contains on a double plate the portraits of four tuberous Begonias named *Lafayette*, unequalled for bedding, for freedom of flowering, and brilliancy of colour; *Joli Robert*, a very pretty orange flower with yellow-striped centre; and an utterly worthless pale pink and yellow, whose names are not worth recording.

W. E. GUMBLETON.

CHRYSANTHEMUMS.

EARLY-FLOWERING CHRYSANTHEMUMS AT TAMWORTH.

IN view of the display which is to take place at Tamworth on September 28 next, a recent inspection of the collection in Mr. William Sydenham's garden afforded considerable interest. This grower hopes to have 4,000 plants in bloom on the date named, and those who can attend will see growing in this trial as many of the older sorts as it is possible to acquire. The Japanese sorts are in a part of the garden specially allotted to them. They are taller than the Pompon sorts, ranging as they do from about 18 inches to 5 feet in height. The plants in many instances have already developed their buds, and so well is the period of autumn covered by the early-flowering Chrysanthemums that their display is now beginning, and all being well, will be continued well into November next. Plants of M. Gustave Grunerwald and in its sports Henri Yvon, Louis Lemaire, and Mrs. R. Mollinson are already in flower, and, under normal conditions, will continue to bloom for a long time to come. The Mme. Marie Masse family of these plants, which includes Ralph Curtis (cream), *Rabbit Burns* (cerise), *Crimson Marie Masse* (chestnut-bronze), and *Horace Martin* (rich yellow), are already showing colour. The Japanese plants impress one with their greater value, chiefly because of their freer style of growth, and the greater variation in the forms and colours of their flowers. The whole of this magnificent collection of early-flowering Chrysanthemums is grown in the open air, and the plants are not disbudded. In this way it is hoped to convince visitors and others of the value of the plants for the outdoor garden where, by a natural system of culture, they may be seen to fulfil all that has been said of them.

The Pompon plants are much dwarfier and remarkable for their sturdy and branching growth. This type is almost stationary, and even those which have been acquired in recent years are either sports or were introduced many years ago and almost forgotten, but rediscovered by Mr. William Sydenham. The plants give promise of a

ree and effective display within the next two or three months. Special pains are being taken to make the forthcoming exhibition, conference, and inspection of the trial a complete success. A handsome silver bowl and numerous medals are to be awarded, and these, together with a paper and discussion, should ensure for the meeting a better knowledge of these useful plants than is the case at present. The laudable object of handing over to the Society for the Prevention of Cruelty to Children a certain proportion of the funds received from visitors to the trial and exhibition deserves to be heartily supported. Bolehall House Gardens are not a great way from Tamworth Station (both Midland and North-Western), and these stations are easy of access from all parts of the country.

D. B. CRANK.

BOOKS.

The Book of the Honey-Bee.—A useful guide to the beginner in bee-keeping, and illustrated with several excellent practical illustrations.

The Tree Book.†—Another of the half-a-crown books now being issued by Mr. Lane. We are not certain of the object of the book. If it is intended as a help in the selection of the most beautiful of trees and shrubs then it fails woefully. We honestly cannot discover any reason for its publication. The illustrations, however, are well chosen and of considerable beauty. We imagine

from its literary flavour that it is intended merely to while away a pleasant hour, and for this purpose it has its value. The few remarks about the way to distinguish trees are useful.

The Shakespeare Country.‡—This is one of the *Country Life* guide books, and is beautifully got up. It is a picture book of rare charm, and, besides being this, is an excellent guide to the Shakespeare country. There are maps and appendices illustrating the Washington and the Franklin countries. No more interesting or better illustrated guide to Stratford-on-Avon and its surroundings has appeared.

The Forest Flora of New Zealand. By J. H. Maiden, and published by authority of the Government of the State of New South Wales. Part III. deals with the Red Cedar (*Cedrela australis*), the Red Mahogany (*Eucalyptus resinifera*), and *Cryptocarya obovata*. The accompanying notes are of great interest. We congratulate Mr. Maiden upon his interesting work.

The Natural History of Plants.§—Parts XI. and XII. of this famous work deal with fruit formation, heteromorphism and alternation of generations, fungus galls or stems, galls, combination of parent characters, graft hybrids, and the origin of species, besides other matter of great botanical interest. We shall review the work when completed more elaborately than is possible when considering the separate parts.

Recently Recognised Species of *Crataegus* in Eastern Canada and New England.||—The descriptions given

in these pamphlets are of the first importance to the botanist. Mr. Sargent's notes are invaluable, and the present publications are of the greatest help to those interested, particularly in the *Crataegus* genus. Mr. Sargent writes that "Since the publication in *Rhodora* in February and April, 1901, of several species of *Crataegus* found in the Champlain Valley by Mr. Ezra Brainerd and other Vermont botanists, and in the neighbourhood of Montreal by Mr. J. G. Jack, numerous collections of these plants have been made in Canada and New England. These disclose new forms which have previously remained unrecognised." The forms described are *C. exigua*, *C. festiva*, *C. Pequotum*, *C. pilosa*, *C. conjuncta*, *C. cognata*, *C. littoralis*, *C. dissona*, *C. Jesupi*, *C. Stonel*, *C. Peckii*, *C. Bissellii*, and *C. Hargerii*. Part II. has descriptions of *C. excluda*, *C. robesoniana*, *C. polita*, *C. fretalis*, *C. Thayeri*, *C. contigua*, *C. irrasa*, and *C. fluviatilis*. Mr. Sargent has also written notes of the *Crataegus* genus in Newcastle County, Delaware, based on collections and observations made during the last three years in this district by Mr. W. M. Canby.

BANANA CULTURE

NOTWITHSTANDING that the Banana in the tropics is considered a fruit of much importance, both as an article of commerce and for the various ways it may be used as food, it is with us in this country only considered of secondary importance as a fruit grown under glass. As a rule it is grown only in gardens which contain large and lofty houses, doubtless for the reason that a considerable amount of space is considered necessary for the cultivation and full development of the plant. Home-grown produce is much appreciated on the table, both as a novelty and from the fact that the quality of the fruit is much better than that usually imported from abroad. The variety chiefly grown in England for fruiting is the Chinese Banana (*Musa Cavendishi* or *chinensis*), by reason of its dwarf habit than *M. sapientum* and its varieties. It is better adapted to cultivation under glass, and for the same reason is well suited for those who would care to make an attempt at Banana culture, but have only a limited amount of space at command, such as a plant stove or a similar structure, which, if from 10 feet to 12 feet high, would afford a good opportunity for growing one or two plants. *M. Cavendishi* may perhaps not be superior in flavour to one or two *M. sapientum*, but it is very good, having a melting buttery taste when thoroughly ripe. Banana plants are, moreover, not to be despised for placing in large conservatories among other subjects planted out.

Banana cultivation is not difficult, and can be easily practised either in borders, large pots, or tubs. The latter method is generally adopted where only one or two plants are grown, or where there is not the convenience for planting out. The pots or tubs should not be less than 2½ feet or 3 feet in diameter and about the same in depth. The bottoms should be perforated with several large holes for allowing a free passage to water; the pot or tub should also be raised 3 inches or 4 inches from the ground by inserting underneath a few bricks and allowing them to remain for the tub to rest upon. Commence then to put in the drainage, a depth from 5 inches to 8 inches being sufficient; lay over the whole of the drainage a turf, grass side downwards. The compost to be afterwards filled in should consist of good turfy loam, which has been cut and stacked for some time previously, and which, if of a moderately rich character, ought not to have the addition of any manure beyond a sprinkling of bone-meal. Excessively rich soil is fatal to stout, healthy growth, which is most essential to success. Feeding can be resorted to afterwards, when the plants are growing freely and their receptacles full of roots.

The preparation of beds or borders is much the same as that described for tubs; of the two methods planting out is more to be desired. Where a house is set aside and devoted entirely to the Banana, this is certainly the best plan to adopt; plants thus grown afford the finest clusters of fruit. In making the borders avoid large deep holes; 2½ feet to 3 feet deep should be sufficient. Provision must be made at the bottom of the border for a drain-pipe to be laid, and this ought to be so arranged as to carry all surplus water to a drain outside. In laying the drainage material a greater thickness is required for borders; in either case it is important that good drainage is given, for the Banana cannot stand a sour and water-logged soil.

PLANTING.—February is the best month for this, and also for giving fresh soil annually as a top-dressing to young plants. Commence by obtaining good, strong, well-rooted suckers, preferably those which have been grown on in pots for some little time previously; fill in the tubs or borders, as the case may be, for inserting the plants so that the roots near the surface will not be buried to a greater depth than 2 inches or 3 inches from the top, using for the purpose the compost before mentioned. As the work proceeds see that the soil is made quite firm, and if at all dry give a thorough watering; growth will be rapid. At the end of the growing season a resting period from four to five weeks should be given by allowing the plants to become somewhat drier at the root. Until then they require an abundance of water. At the end

of their rest they will throw out a fruit cluster, which when developed must at once be given support to prevent breaking down. Avoid wetting the plants overhead till flowering is over; when the fruit is set expose it as much as possible to sunlight. At the end of each cluster will be observed a barren portion; this should be cut away to add to the development of the fingers. After the latter are ripe and have been gathered the old plants are worthless and should be cut down. A sucker from the base should be allowed to grow. With regard to temperature, the conditions which govern an ordinary stove house in both summer and winter will meet their requirements.

The Banana is a voracious feeder, and this should be particularly noted with those plants which are in restricted root areas. They will benefit during the growing period by regular supplies of nourishment, given in the form of liquid manure or fertilisers once a week alternately, or the one form used regularly. As the fruit commences to ripen clear water only should be given.

R. BARTON.

SOCIETIES.

NEWBURY HORTICULTURAL SOCIETY.

THE forty-seventh exhibition of the above society was held on the 3rd inst., and was an excellent one in every way, but especially was this the case as regards cut flowers and fruit, while the vegetables were really excellent, considering the peculiar season, as in some places the crops are very poor. The large open

PLANT CLASSES

were not up to the usual average, but good things were staged in that for plants in bloom, the first prize going to Mr. Leith, Beaupaire Park Gardens, he having a very good six, the *Clerodendrons* and *Allamandas* being well bloomed; Mr. Surman, Donnington Park, was second; and the veteran Mr. C. Ross, Welford Park, a close third. For foliage plants, Mr. Leith was a good first, and here some large well-grown *Crotons* of good colour were shown. Though the competition was not strong, the plants staged were good, Mr. Ross being second with smaller specimens. Ferns also made a small class, but those staged were good. Mr. T. Leith secured the premier award. Colours are always a feature at this exhibition, and this year, though the plants were smaller than usual, they were well coloured and nicely grown. Mr. T. Surman was first; Mr. R. C. Norris second; and Mr. Ross third, with small but highly-coloured specimens.

Fuchsias, always a feature at this show, were a smaller class than usual, but the premier award was easily taken by Mr. T. Surman, Donnington Park, he having plants from 6 feet to 9 feet, grandly flowered; the second prize lot were much smaller. Mr. G. A. Cox had well-flowered plants and in good condition. Specimen plants in bloom were a strong class and very fine. Mr. T. Surman led with grand *Hydrangeas*, having some hundreds of flowers; Mr. C. Ross a good second; and Mr. F. Abery, Tilehurst, third. Mr. C. Ross had a very fine *Alcaecia macrochiza* well coloured. It is not often one sees this plant so well grown.

At this show a great feature is made of the stands decorated to show the best arrangement for conservatory decoration; the stands are low, and the prizes given for the best taste in arrangement. There were five competitors, and all were good, but some lacked colour, others finish. Mr. J. Howard, gardener to Lady Sutton, Benham Park, was a good first, having very light materials and good drapery, no part of the stage being visible. Mr. Norris was a close second, having some good *Orchids*; and Mr. C. Ross third; two other prizes being awarded in this class.

Very fine *Begonias* were staged, the amateurs having finer plants than the gardeners in several cases. Messrs. Clark and King had the best blooms in the single class, and Messrs. Hopson, Surman, and Norris in the double. In this class splendid plants were shown, and the competition was very strong. The plants for table decoration were well staged, Messrs. Leith, Ross, and Howard securing the awards in the order named.

ROSES

were a feature, and though some of the blooms staged showed traces of the late rainfall there were some good flowers.

In the nurserymen's classes Messrs. Cooling and Sons, Bath, were first with beautifully fresh blooms, Mr. J. R. Tranter, Henley, being a close second, and Mr. Mead, Bath, third.

In the private class Lady Sutton led with some beautiful Teas well set up, the blooms being fresh and of splendid proportions; Mr. H. Mead second, and Mr. H. Smith a good third.

The cut flowers, especially the twenty-four bunches of miscellaneous blooms, were well shown. Mr. T. Leith was a good first, staging in glasses and lightly arranged; Mr. W. T. Abery a close second, and Mr. D. Bosley third. Mr. King had the best *Zinnias*, Mr. Bingham being second, and Mr. Tranter the best *Carnations*, Messrs. Smith and Abery taking second and third prizes. There was no lack of entries in the cut flower classes. Messrs. Abery and J. F. Marchant staged very good bouquets, and Messrs. Tranter, Bosley, and Maher had the best *Dahlias*. The class for

TABLE DECORATIONS

was not so keenly contested as usual. Miss F. Harrold had the best table, using Iceland Poppies, Mrs. Attewell being

second, but using too much greenery, Mrs. C. Stradling was a close third, having red *Nasturtiums*, and, though a trifle low, the effect was charming.

FRUIT

was well staged. Grapes were exceptionally fine. For Bath Hampshire Messrs. Surman, Howard, and Lees were the successful exhibitors. In the white class Messrs. Surman, Howard, and Galt, Aldermaston Court, were the winners. In the Muscat class Messrs. Galt, Ross, and Maher secured the awards. Mr. Galt's Muscats being very fine. The best Pine-apple came from Mr. Howard, and Mr. Ross had the best dessert Apples (Mr. Gladstone being staged), and Stirling Castle in the cooking class. Some remarkably good Cherries were staged by Mr. Maher of Gattendon Court, and the best Peaches from Beaupaire Park and Mr. Ross. Nectarines from Messrs. Lees and Leith, Mr. Howard also staging good Orleans Plums, and Mr. T. Surman Greening, Mr. Cox having the best Pears. The best Figs came from Sir Alex. Arbuthnot (gardener, Mr. F. Mara), and small fruits were excellent, Messrs. Ross and Surman being the leading exhibitors.

VEGETABLES

were a feature. Mr. Ross had the best Tomatoes. Onions were very fine, Messrs. Mara, Surman, and Elford having grand dishes. Peas were better than usual, and Messrs. Howard, Leith, and Ross were the leading exhibitors. Other vegetables were equally good. The amateurs and cottagers made a splendid display.

Wild flowers and stands of garden flowers were very well done. The same remarks apply to the fruit and vegetables.

BASINGSTOKE.

A FINE day favoured the twenty-seventh annual summer show this year, held in Golding's Park, on the 3rd inst., and was in every way a success.

PLANTS

were more numerous than usual. For a group of miscellaneous subjects, arranged for effect in a semi-circle, there was only one entry, from Mr. G. Best, gardener to Mr. F. D. Leyland, The Vyne, Basingstoke. This, however, was well worthy of the premier award given to it.

For nine specimens in or out of bloom, Mr. W. Hunt, gardener to Mr. R. Moss, Fern Hill, Blackwater, was the most successful, winning quite easily with *Allamanda Hendersonii*, finely flowered, and *Acalypha sanderiana* with numerous blossoms as the leading subjects; Mr. J. Wasley, gardener to Mr. J. B. Taylor, Sheffield Manor, Basingstoke, was second with healthy examples of *Kentia fosteriana* and *Microlepis hirta cristata*.

Mr. Wasley was first for four foliage plants with healthy examples of *Kentia belmoreana*, *Adiantum farleyense*, and *Woodwardia radicans*; Mr. Hunt second.

For four flowering plants, these two exhibitors changed places, Mr. Hunt winning with *Allamanda Hendersonii*, *Lilium lancifolium roseum*, *Cassia corymbosa*, and *Acalypha sanderiana*, Mr. Wasley also staging well.

For a single specimen flowering plant, Mr. T. Russell, gardener to Mr. R. Blencowe, Shippett's House, Basingstoke, staged a *Fuchsia Elegans* fully 8 feet high, and profusely flowered, winning the premier award, Mr. Hunt with *Acalypha sanderiana* coming next.

Exotic Ferns were well shown. For six Mr. Wasley won first with *Microlepis hirta cristata*, *Davallia bullata*, *Adiantum farleyense*, *A. cardiochloana*, and *Davallia polytrichum*, Mr. Hunt, with admirable examples of *Adiantum canaliculatum* and *A. gracillimum*, was second.

Fuchsias were a grand display. For four, Mr. Russell staged *Charming*, *Marginalia*, *Rose of Castille*, and *Elegans* fully 7 feet high and grandly flowered, winning the premier award with ease; Mr. C. Kow, The Common, Basingstoke, was second. Table plants were finely shown, Mr. Best winning for twelve, with such produce as is desirable.

Colours were finely staged. For four Mr. Best won quite easily with grandly coloured plants, quite 5 feet high, and neatly trained pyramidal form; Mr. W. Green, gardener to Sir E. F. Bates, Manydown Park, second.

Liliums were well staged by Mr. Hunt, who won quite easily for four pots with *L. lancifolium rubrum* and *L. roseum* freely flowered; Mr. Tamplin, gardener to Mr. W. B. Mitchell, Down Grange, Basingstoke, second. Mr. Hunt had the best *Caladiums* in four plants; Mr. Best a close second. Mr. W. Green had the best show of tuberous *Begonias*, well flowered double and single varieties; Mr. Best second.

CUT FLOWERS.

For twenty-four Roses, distinct, there were few entries. Mr. Neville, gardener to Mr. F. W. Flight, Cornhill, Twyford, Winchester, was easily first with medium-sized blossoms quite well coloured for the season. For twelve distinct, Mr. Neville also won, and so he did for twelve Tea varieties, staging Mrs. E. Mawley, Anna Olivier, Maman Cochet, and Caroline Testout well. Mr. Neville also had the best *Carnations* and *Picotees* in twelve varieties. So good were they that we give their names for future guidance; Mrs. F. W. Flight, Myrab, Mrs. B. Bendas, Gromow, Guineas, Albata, Amphion, Alcibus, Argosy, and Countess Verulam; Mr. T. Tucker, gardener to Dr. Maples, Kingsclere, second. For six bunches of Sweet Peas, Mr. C. W. Broadmore, Winchester, won easily with Lady Ormsby Gore, Duke of Westminster, Countess Cadogan, and Dorothy Eckford; Mr. S. Clifton, Winchester, second.

Forty-two herbaceous cut flowers Mr. Hunt just won from Mr. Wasley with really good bunches of *Platyodon grandiflorum album*, *Coreopsis Eldorado*, *Pentstemon Newbury Gem*, and *Achillea The Pearl*. For a collection to fill 6 feet run of tabling Mr. Hunt also won the first prize with a showy exhibit; Mr. Tamplin second.

FRUIT

was plentiful and good. For a collection of six varieties Mr. Wasley had good Madrasfield Court Grapes, Melons, Figs, Peaches, Nectarines, and Oullin's Golden Gage Plum; Mr. Hunt second, with a good exhibit also.

Classes are here provided for Grapes rather freely. For no bunches Black Hamburg Mr. Tampion won with medium-sized well-finished examples; Mr. Hunt second. For two bunches black, any other variety, Mr. Wasley aged very fine Madresfield Court, and secured the premier award; Mr. Hunt with Muscat Hamburg gained the second place; Mr. Green with Gros Maroc coming next.

In a similar class for any Muscat variety Mr. Wasley again depended upon Madresfield Court, and won premier place; Mr. Hunt with Muscat Hamburg was second; Mr. Green with Muscat Alexandria third. Mr. Hunt staged really good Foster's Seedling for the first prize for two bunches white any variety not Muscat.

Melons were really good in quality. Mr. Tampion with Windsor Castle won for green flesh. Mr. Hunt with actress's Scarlet occupied a similar position in the scarlet and division.

Mr. Wasley with Peach Exquisite won first place for a dish of five; Mr. Best with Alexandria second. Pine-apple ectarine won also for Mr. Wasley the principal place for fruit.

VEGETABLES

were not so plentiful as usual here. Mr. Kneller, gardener to Sir Wyndham Portal, Malahanger Park, won both Messrs. Sutton's prize for six varieties and the society's prize for light dishes with excellent examples of Perfection Tomato, Alisa Craig Onion, Adman's Glory Potato, Intermediate Marrot, Marrowfat Pea, and Autumn Giant Cauliflower; Mr. Best a good second in both classes.

NON-COMPETITIVE EXHIBITS

were plentiful and interesting. Messrs. B. Ladhams, Limited, Shirley, Southampton, had a capital lot of herbaceous lowers; Galliardias Eownham's Queen, Primrose Gem, and 3. Ladhams were noteworthy; Rudbeckia hirta conspicua, Xeropepis Eldorado, and Lobelia cardinalis Andrew Barlow, in extremely richly coloured variety.

Mr. Pritchard, Christchurch, also had an effective bank of sturdy cut flowers. Gladioli of note were Mrs. Beecher, crimson with white throat; Baron Joseph Hulot, purple, very fine; Lafayette, cream with crimson throat; Blonde, edged with white throat markings; and Commandant de Serlach, bright blue; he had Tritomas Rufus and Lemon Queen also.

THE MIDLAND CARNATION AND PICOTEE SOCIETY.

THIS exhibition took place on the 6th inst. in the Botanical Gardens, Edgbaston, Birmingham, the entries being very numerous in all the classes, and in that for novices as exhibitors they represented a most satisfactory addition in point of numbers. It is very rare, indeed, that visitors can set up their Carnations beneath a canopy of growths of Bougainvillea glabra, which festoon a large part of the show house of the Botanical Gardens. The two planted-out examples are now gloriously radiant with mauve bracts and objects of great beauty. One sees Carnations at the best advantage at Edgbaston with their background of Fuchsias. It is a model place for such a show; the houses are extremely gay with foliage and flowering plants, and the grounds, always so neatly kept, are truly delightful just now. Mr. R. Sydenham's absence was sincerely regretted. He sailed on Saturday, the 1st inst., from Southampton on a voyage for a few months, which, it is fervently hoped, will restore his wonted vigour of mind and body. Kindly and sympathetic reference was made by Professor Hillhouse—at the luncheon which followed the making of the awards—to the work Mr. R. Sydenham had done for the society in the past, and a photograph was taken of the exhibitors, judges, and officials, which is to be presented to Mr. Sydenham in a suitable album, to which will be attached the signatures of all who form the group.

Opinions differed as to whether the quality of the blooms was in advance of those shown in London. We thought the white ground flukes and bizzarses brighter generally than those seen at the Drill Hall, while the white ground Picotees had a purity and substance not so fully possessed by those seen in London. The yellow grounds, selfs, and fancies were probably not so large, but many of them were highly refined. The judging was undertaken by a large staff. The task of asking the awards to the blooms shown in the single houses was a very onerous one indeed, so many blooms being tagged.

SELF CARNATIONS.

There were seven entries of twelve varieties, the first prize going to the lot of Mr. R. C. Cartwright, King's Norton (Mr. I. Rudd, gardener), who had in very fine character Ensign, beautiful white; Bomba, Sir Bevis, deep crimson shaded with maroon; Lustre, Comet, Seagull, a lovely bluish variety; Benbow, deep buff; Mrs. E. Hambro', Mrs. Colby harpin, shaded cinnamon; Germania, still one of the very best yellow selfs; Enehantrass, and Mrs. Prinsep, also a yellow self. Second, Mr. A. W. Jones, Sleehford, who had very fine blooms of Agnes Sorrel, Much the Miller, Sir Bevis, Dudley Stuart, Mrs. E. Hambro', Nubian, Tredegonde, Italian, Germania, Benbow, and Comet. Mr. C. F. Thurstan, Wolverhampton, was third, and four other prizes were awarded. There were twelve exhibitors of six selfs, and Mr. V. H. Parton, jun., King's Heath, treasurer of the society, was first with very fine blooms of Much the Miller, a very fine white; Nubian, Barra, Almoner, a yellow self; Agnes Sorrel, and Mrs. E. Hambro'. Second, the Rev. C. A. Gottwalt, Hedsor, Droitwich, who had Burns, bright pale red; John Pope, rosy pink, a fine-petalled flower; Mrs. E. Hambro', Richard Dean, a new purple self giving a deep shade of colour much wanted among the selfs; Glowworm, Avalanche, &c. Third, Mr. W. H. Twist, Yardley. All the eight prizes offered were awarded.

YELLOW GROUND PICOTEE.

There were seven exhibitors of twelve blooms, some slightly refined specimens being staged. The first prize went to Martin R. Smith, Esq., Hayes Common, Kent, who had in fine character Franklin, Badoura, Countess of Darnley, Daughter of Heth, Lady Avebury, Conquette, Countess of Verulam, Morgiana, Isolt, Aphrodite, Mrs.

Walter Heriot, a beautiful variety; and Danora. Mr. A. W. Jones was an excellent second; he had Lady Bristol, Hesperia, Gronow, Alcinous, Mohican, Lady St. Oswald, Badoura, Mrs. Hadley, and Gertrude. Mr. A. R. Brown, Handsworth, Birmingham, was third. Seven prizes in all were awarded. With six varieties, there being fourteen competitors, Mr. W. H. Parton, jun., King's Heath, was first; he had beautiful blooms of Gronow, Hesperia, Mohican, Alcinous, Lady St. Oswald, and Gertrude. Mr. A. Chatwin, Edgbaston, came second; he had excellent blooms of Onda, Lady St. Oswald, Daniel Defoe, Lauzan, Gertrude, and Hesperia. Mr. W. H. Twist, Yardley, was third.

Fancy Carnations in twelves were also very fine. Mr. A. W. Jones was placed first out of a number of competitors, with Voltaire, Queen Beas, Argosy, Oakley, The Gift, Alexandra, Ivo Sebright, Charles Martel, Eldorado, Brodeck, Achilles, and Ueberon. Mr. R. C. Cartwright came second with Argosy, Emperor, The Gift, Voltaire, Queen Beas, Amphion, Hidalgo, Euryalus, Charles Martel, Pagan, Duke of Alva, and Renegade. Mr. Martin R. Smith was third. In the class for six varieties there were several stands of fine blooms; unfortunately, particulars of this class were overlooked.

With twelve white ground Picotees, Mr. F. W. Goodfellow, Sutton Road, Walsall, was first, with rose edged Little Phil, rose edged Lady Louisa, purple edged Amy Robarts, red edged Mrs. Gorton, red edged Brunette, purple edged Mrs. Openshaw, red edged Thomas William, rose edged Fortrose, rose edged Mrs. A. Brown, purple edged Harry Kenyon, and purple edged Pride of Leyton; second, Messrs. Thomson and Co., Sparkhill, who had—differing from the foregoing—light rose Favourite, heavy rose Mrs. Beavick, heavy rose Mrs. Payne, heavy rose Mrs. Sharpe; Mr. C. F. Thurstan, Wolverhampton, was third. With six blooms, Mr. D. Walker, Kilmarnock, was first; he had heavy purple edged Fanny Tett, heavy rose Glio, Little Phil, Mrs. Openshaw, Light red edged Grace Darling, and Brunette; the Rev. G. C. Gottwalt was third.

With twelve white ground Carnations, Messrs. Thomson and Co. were first. They had P.F. Geo. Melville, C.B. Master Fred, P.F. Gordon Lewis, P.F.B. W. Skirving, P.F.B. George Radd, S.B. Robert Houlgrave, S.F. Guardsman, S.B. Robert Lord, S.F. Sportsman, S.F. Meteor, S.B. George, and R.F. MacRohan; Messrs. Pemberton and Son, Walsall, were second, and Mr. C. F. Thurstan third. With six varieties Mr. F. W. Goodfellow was first; he had Master Fred, George, Gordon Lewis, George Radd, Sportsman, and S.B. Admiral Curson; Mr. D. Walker was a close second, and Mr. E. Rosseter, Langley Green, third.

In the single bloom classes an enormous number of flowers were staged; the best scarlet bizzar was Robert Houlgrave; crimson bizzars, Master Fred and J. S. Hedderley; pink and purple bizzars, George Radd and J. S. Hedderley; scarlet flake, Sportsman; rose flake, Morton and Mrs. May; purple flake, Gordon Lewis; heavy red Picotee, Brunette; light red Picotee, Mrs. Gorton; heavy purple edged, Mrs. Openshaw and Amy Robarts; light purple edged, Pride of Leyton and Lavinia; heavy rose edged, Mrs. Sharp and W. H. Johnson; light rose or scarlet, Fortrose and Favourite; light yellow ground Picotee, Mrs. W. Heriot and Mrs. Durrant; heavy yellow ground Picotee, Gertrude; yellow ground fancy, Charles Martel, Brodeck, and Voltaire. Fancy, other than yellow ground: Delightful, bluish ground, heavily flaked with crimson-purple; Delightful, white, with slight stripes of rose; and Muletter, scarlet flaked with heliotrope; white self, Ensign and Mrs. E. Hambro'; buff self, Mrs. R. C. Cartwright; bright reddish salmon, Benbow; scarlet self, Etna and Isinglass; yellow self, Seymour Corcoran, Goliath, and Germania; rose self, Lustre and John Pope; dark crimson, &c., Roseleigh Gem, heliotrope; Cassandra, maroon, shaded crimson and purple; Lady Jane Grey, pale heliotrope, and Jocelyn, dark heliotrope.

Then came several classes for undressed flowers shown singly in vases. There were four classes, and they were well filled, but the flowers were generally unnamed. There were eight classes still for undressed blooms shown in threes. In addition there were three small classes for novices, in which the competition was good, the exhibitors being all promising recruits.

PREMIER FLOWERS.

The task of selecting these from the whole show was a very onerous one. Premier bizzar Carnation S.B. Robert Houlgrave, richly marked and coloured, shown by Mr. D. Walker. Premier flake, P.T. Gordon Lewis, a very fine bloom, shown by Messrs. Thomson and Co.

Floral decorations took the form of a shower bouquet of Carnations, and also ladies' sprays and buttonholes made up with the same flower. There was also a class for a floral arrangement of Sweet Peas set out on a round table 2½ feet in diameter.

PRIZES FOR SWEET PEAS.

Mr. Robert Sydenham's special prizes for Sweet Peas in twelve bunches brought a very fine exhibition of this flower, Mr. Thomas Jones, Euston, taking the first prize with the following in the best character: Lady G. Hamilton, Hon. F. Bouverie, Jeannie Gordon, Miss Willmott, Sadie Burpee, Dainty, Lottie Eckford, &c. Mr. J. F. Clark, Leicester, was second.

Certificates of merit were awarded to the following new varieties of Carnations: Daffodil, a pale pure yellow self of fine form and substance, from Mr. M. R. Smith, who also obtained the same award for the following: Mrs. W. Heriot, a beautiful light edged yellow Picotee, with a wire edge of rose to the deep yellow petals; Strongbow, a very fine yellow ground fancy in the way of Hidalgo, with less colour and not so dark; Lustre, a bright rose self from Mr. R. C. Cartwright; and to Ivo Sebright, already described, from Mr. E. Harrington.

There were several very attractive trade exhibits. Silver-gilt medals were awarded to Messrs. Hewitt and Co., nurserymen, Solihull, for floral decorations, cut flowers, &c.; to Messrs. B. R. Davis and Son, nurserymen, Yeovil,

for a very fine collection of Begonias, double and single; and to Messrs. Felton and Co., court florists, Hanover Square, London, for elaborate floral decorations and vases of Carnations. Large silver medals were awarded to Messrs. Dicksons, Limited, Chester, for a very fine bank of hardy flowers; to Mr. J. H. White, nurseryman, Worcester, for the same; and to Mr. Vincent Slade, nurseryman, Taunton, for cut zonal Pelargoniums. Small silver medals to Messrs. W. Cutbush and Son, for Malmalson Carnations; to Messrs. Simpson and Co., for Sweet Peas; to Mr. W. Sydenham and to Mr. W. L. Pattison, both for Violets; and to Mr. Watts, for Carnations.

SALTAIRE, SHIPLEY, AND DISTRICT ROSE SHOW.

THE recently-formed Rose society for Saltaire, Shipley, and district has made an excellent start. The first show, which was held on July 21, was as pretty an exhibition as one could wish to see, and visitors were delighted. It has been stated that the Saltaire and Shipley district is most eminently suitable for the cultivation of the Rose, both in regard to soil and climate, and the show seemed to favour that idea. Certainly the principal prizes were carried off by growers from a distance, but then this was the new society's first venture, and by another year local exhibitors may be more successful. At any rate, a healthy rivalry will do a lot of good.

The promoters were fortunate in securing exhibits from such famous growers as Dickson and Sons, Limited, of Newtownards, County Down, Messrs. Harkness and Sons, of Bedale, and Messrs. J. and R. Callam of Wakefield. These three firms carried all before them, and were, indeed, almost the only outside competitors. The awards of the judges—Messrs. W. Daniels, Crow Nest Park, Dewsbury, and Thomas Hartley, Ladye Royde Hall, Bradford—placed them in the order named. The Irish firm sent some lovely blooms, and easily carried off the premier prize in five classes, and also the National Rose Society's silver-gilt medal. The exhibits of Messrs. Harkness and Sons were very little inferior to those of Messrs. Dickson and Sons. Only the trained eye of a competent judge could distinguish between them. Messrs. Callam also showed Roses that were much admired for their form, colour, and size. In the local classes Mr. A. H. Rigg carried off the palm with some choice blooms, for which was awarded three first prizes. He also secured the National Rose Society's silver medal.

OPEN CLASSES.

Cut Roses, thirty-six blooms, not less than twenty-four varieties: First, Dickson and Sons, Limited, Newtownards, County Down; second, Harkness and Sons, Bedale; third, J. and R. Callam, Wakefield.

Twenty-four blooms, not less than eighteen varieties: First, Dickson and Sons; second, Harkness and Sons; third, J. and R. Callam.

Twelve blooms, not less than nine varieties: First, Dickson and Sons; second, J. and R. Callam; third, Harkness and Sons.

Twelve Tea Roses: First, Dickson and Sons; second, Harkness and Sons; third, J. and R. Callam.

Six bunches Roses: First, Dickson and Sons; second, Harkness and Sons; third, J. and R. Callam.

Six bunches Tea or Noisette Roses: First, J. and R. Callam; second, Harkness and Sons.

Sweet Peas, twelve bunches: First, H. Clarke and Son, Rodley; second, A. W. Whitelock, Ripon.

Bouquet Sweet Peas: First, W. Moorby, Saltaire; second, A. W. Whitelock; third, Dickson and Sons.

Twelve bunches hardy herbaceous flowers: First, R. Eichel, Gilstead; second, S. Margerison, Calverley.

Shower bouquet: First, Mrs. C. B. Shaw, Shipley; second, Dickson and Sons.

BRITISH PTERIDOLOGICAL SOCIETY.

THE annual meeting of this society was held in the Institute, Bowness, on Monday, the 3rd inst. There were present Dr. Stansfield (president), and a fair number of other members both local and general. The minutes of the previous annual meeting were read and confirmed, and the secretary's and treasurer's reports showed the financial affairs of the society to be in a sound condition. The president, in his opening address, made reference to the gaps which had been caused by death in the ranks of the society since he last met the members, and expressed his pleasure at meeting many old and some new friends. He congratulated the society on the publication of the book of "British Ferns," which had been compiled by members of the society, under the editorship of the late president, Mr. C. T. Drury, F.L.S., V.M.H., containing up-to-date lists, with details and dates of origin of all the best varieties of the various British species of Ferns. He urged the members to keep a watchful eye upon the book, so that in any future editions possible flaws might be corrected, and new matter bearing upon the subject be inserted, so that the book might continue to be the standard work of reference upon the subject. Several of the chapters on apocryph, &c., by Mr. Drury and others had never before been published in popular form, and would constitute a feature of great biological interest in the book. The election of officers for the ensuing year was then gone through, most of the old officers being re-elected, but with some changes among the vice-presidents and committee. The place of meeting for next year was again fixed at Bowness, this being fairly central for members from England, Ireland, and Scotland, as well as being an attractive place of meeting from its natural advantages and surroundings. Two papers by Mr. C. T. Drury, F.L.S., were read, in the absence of the writer, by the president, their subject being "Varietal Types of British Ferns" and "The Propagation of Varieties of *Lastræa montana*." The president also read a paper of his own upon "The Study of the Abnormal." All three papers were received with applause, and were evidently highly appreciated. A short discussion followed, in which Mr. Garnett, Mr. Phillips, Mr. Whiteside, Mr. Edwards, and others took part. Mr. Garnett expressed his strong belief in the influence of environment in the production of varieties,

and it was pointed out that there was a strong case in point in a beautiful crested form of Lady Fern which had been picked up last year in this neighbourhood by Mr. Phillips as a slightly abnormal but not crested form; during the year, however, that it had been under cultivation, it had developed into a very fine crested or cristata form.

The plant was exhibited by Mr. Phillips. Mr. Garnett exhibited a very promising plumose setigerum form of Athyrium, but the Fern was not yet mature, and it was thought desirable to defer naming it for another year. Mr. J. Loveday exhibited some very finely grown crested forms of A.f.f. setigerum; Mr. Henry Bolton, Mr. Loveday, Mr. Praeger, and others exhibited fronds all of more or less interest and importance. The sensation of the year, however, was a magnificent thoroughbred grandclope form of *Lastrea montana*, which had been found within a few days in Longleddale by Mr. Smithies. The certificate of merit of the society was awarded to this Fern under the name of *Lastrea montana grandclope Smithies*. It is singular that Mr. Smithies is the only previous finder of a grandclope form of *montana*; the present find, however, quite surpasses previous records of this type in this species, and is equal to the best grandclope forms found in other species. The meeting concluded with votes of thanks to the writers of the papers, which it was decided should be published in the transactions of the society.

BRISTOL AND DISTRICT GARDENERS' ASSOCIATION.

By the kind invitation of the Rev. G. F. Whidborne, this society held its monthly meeting at the Priory, Westbury-on-Trym, on Thursday, the 6th inst. About sixty members were entertained to tea by Mr. Whidborne, after which the company were afforded the opportunity of viewing the picturesque grounds and greenhouses, so admirably kept under the able management of Mr. Whitlock, the head gardener. The visitors were much struck with the cleanliness of the garden, lawns and pleasure grounds alike being well kept, while the absence of weeds was remarkable. Notwithstanding the bad season the summer bedding looked exceptionally well, while the visitors took special notice of several rows of Sweet Peas showing good bloom. The greenhouses, too, were much admired. Amongst the plants in bloom were noticed some beautiful *Torenia*, *Anthuriums*, and *Begonias*, while several *Orchids* lent a charm to their appearance with *Cattleyas*, *Dendrobiums*, &c., in excellent condition. Probably the most interesting to the visitors was a corridor wall 100 feet long and 80 feet high, covered with zonal *Geraniums*, which is certainly a sight not seen every day. Those planted some thirty years ago have thrived wonderfully, and are now one mass of bloom. Afterwards the members adjourned to a large room in the garden and proceeded with their meeting, when Mr. J. T. Curtis, gardener to Mr. W. Howell Davis, read a most practical paper on "The Eucharis," he being the successful competitor for the prize offered by Messrs. Parker and Sons for the best essay on the subject. He dealt in an able way with the cultivation of these useful plants—composts, watering, and feeding alike receiving attention. His paper was an excellent one, and on the motion of the Rev. G. F. Whidborne, he was accorded the congratulations of the society. Mr. Whidborne then presented five Royal Horticultural Society's medals to members for regular attendance. Mr. W. Ellis Groves proposed a hearty vote of thanks to Mr. Whidborne for his great kindness, and for the interest he has taken in the society, which was heartily received. This brought to a close a most enjoyable evening. Prizes for two bouquets of hardy flowers were awarded to Messrs. Ambrose (first) and Coombs (second).

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last. Mr. Thomas Winter presided. Seven new members were elected, and one other nominated. Four members are receiving sick pay, and eight are on the benevolent fund at the present time. Three other members have been relieved from this fund during the year.

OBITUARY.

MR. J. S. HEDDERLEY.

WHILE at the Midland Carnation show at Birmingham on the 6th inst. I was made aware of the fact that my old friend John S. Hedderley, of Sneinton, Nottingham, had recently passed away at a great age. I met him for the last time three years ago at the Birmingham Carnation show, and though failing in strength his interest in the Carnation, which was his favourite flower, was as keen as ever. When fifty years ago Derby and Nottingham were the centres of Carnation culture in the Midlands, J. S. Hedderley was associated with E. S. Dodwell, J. Holland, J. Bayley, W. M. Hewitt, Thomas Lord, J. Hepworth, and others in promoting the culture and exhibition of the flower. He outlived all his contemporaries of that period. His name is handed down to posterity through his association with scarlet flake Carnation Sportsman, which originated as a sport from S.B. Admiral Curzon in 1855, which, as Mr. E. S. Dodwell remarks, "went at one bound to the top of its class," and in the following year, on

the occasion of the holding the annual exhibition of the National Carnation and Poinsettia Society at Birmingham, Sportsman took all the prizes in the class for single blooms of scarlet flake Carnations. Sportsman, which is brilliantly flaked with scarlet on a white ground, has held its own for nearly half a century, and on the occasion of the recent exhibition of the National Carnation Society at the Drill Hall, on July 21, it took the first prize as the best scarlet flake, and at the recent exhibition of the Midland Carnation Society it was awarded the four first prizes in a similar class. The success of the sport was ever a matter of great joy to Mr. Hedderley. He also raised a beautiful rose self named Royalty, which I think must be identical with the one that Mr. J. R. Upton is in the habit of setting up on long stems in vases at the meetings of the Royal Horticultural Society at the Drill Hall. Mr. Hedderley cultivated Roses and other popular flowers. He was a born florist, and was full of pleasing reminiscences of men and flowers. Alas! scarcely one remains of the florists who made floriculture so popular in the Midlands half a century ago! R. DEAN.

Royal Horticultural Society.—The next fruit and flower show of this society will be held on Tuesday next, the 18th inst., in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. A lecture on "Hollyhocks" will be given by Mr. Webb at three o'clock. At a general meeting of the society held on Tuesday, the 4th inst., twenty-five new Fellows were elected, among them being Sir Joselyn Gore Booth, Bart., Colonel the Hon. G. Napier, Major-General H. H. Lee, and Major Bernard J. Petre, making a total of 1,070 elected since the beginning of the present year.

Dahlia show, September 1 and 2. The Royal Horticultural Society will hold a special exhibition of Dahlias on September 1 and 2, in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, Westminster. At this meeting only Dahlias can be shown, with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 6 p.m. on the second day, but other plants may be removed as usual. For schedule of prizes see the Royal Horticultural Society's "Book of Arrangements" for 1903, pages 89 to 93, or separate schedules can be obtained on application to Mr. P. W. Tullock, Sterndale, New Church Road, Hove, Sussex, secretary to the National Dahlia Society. A lecture on "Judging Cactus Dahlias" will be given on September 1 by Mr. C. G. Wyatt at three o'clock.

Nature Study Exhibition.—A nature study exhibition will be held at the offices of the Civil Service Commission from October 30 to November 3. Lord Avebury is the chairman of the general committee, and the patrons include the Duchess of Teck, the Archbishop of Canterbury, the Duke of Argyll, Lord Strathcona, and Sir William Hart-Dyke. Upwards of seventy educationalists, consisting of members of Parliament and representatives of the various education bodies and natural history societies, form the committee. A provisional list of prizes has been compiled, setting forth those which have been offered for competition by private individuals and many of the more important firms of publishers. This, with the prospectus and regulations, may be obtained from the secretary of the Home Counties Nature Study Exhibition (Mr. Wilfred Mark Webb, F.L.S.), 20, Hanover Square, W.

Royal Botanic Society.—The annual meeting of the Royal Botanic Society of London, was held on Monday last, at the Gardens, Regent's Park. Mr. C. Brinsley Marlay, who presided, congratulated the Fellows on the improved financial position of the society. The accounts showed a slight profit upon the year's working, although a considerable amount had been expended on repairs. Owing to the damage to plants caused by the frequent use of gas in the conservatories, the introduction of electric light could not long be delayed, so that this and the work of developing scientific instruction would entail considerable cost. He, therefore, hoped that the Fellows would introduce

new members, and thus enable the society to carry on a work which was of the utmost importance both from a public and scientific point of view. The report was seconded by Sir William Collins, M.D., and unanimously adopted.

The Crosefield Conservatory at Warrington—An interesting ceremony.—It will interest many of our readers to know that the grand pyramid Camellias at Walton Lea, Warrington (probably the finest in the kingdom), have been removed in almost perfect safety to the new park presented by the late Mr. George Crosefield, in which is situated the handsome new conservatory given recently by Mrs. John Crosefield. There was a large attendance at the opening, which was presided over by the Mayor and Mayoress, Mr. and Mrs. J. C. Parr, Mr. Crosefield, in declaring the conservatory open, spoke of the great interest which the late Mr. Crosefield took in his Camellia trees, and she was glad to think that under the care of Mr. Parker, the head gardener at the park, all the trees had been successfully removed with two exceptions. She hoped that Warrington might soon have its winter garden, and that the poorer people might enjoy the benefit of the conservatory. The Mayor, accepting the gift on behalf of the town, referred in terms of warm praise to the kindness of the donor and the Crosefield family, saying that the gift would be highly valued by the townspeople. He then presented to Mrs. Crosefield a handsome silver Rose bowl, which was gracefully acknowledged by the recipient, who afterwards, with the remainder of the company, inspected the park and conservatory.

The Raspberry-Blackberry The Mahdi.—At this season, when the Raspberry is getting scarce, this new hybrid will be most valuable in filling in the gap between the early and late Raspberries. Messrs. Veitch have certainly given fruit growers a most valuable addition in the new Mahdi, and as it fruits grandly there will be no fear of failure, as from my own observation it thrives with very simple treatment, and is not at all fastidious as to soil. This new race of fruit is most interesting, as, although allied to the common Blackberry, the fruits are equal to the Raspberry, though the growth resembles the Blackberry. In very many gardens Blackberries, especially the American forms, are not a success, but this is the case with the new cross, as the plant is a good bearer, makes a delicious preserve, and for taste is excellent when mixed with Red Currants. It is harder than the Raspberry, and this is a great gain.—G. WYTHES.

Tufted Pansy Walter Gale.—Tufted Pansies of a blue colour are not numerous, and because of this novelties possessing all the points that go to make a good bedding plant should be made a careful note of. The raiser (Mr. William Sydenham) of this variety describes the colour of the flowers as purple-blue, but the blue is quite a new and distinct shade, and when a number of plants are grouped together the remarkably free display is very pretty and effective. Each flower is borne on a footstalk of good length and perfectly upright, so that the flowers stand out well above the foliage. The plant is of free growth, has a good constitution, and deserves to be freely grown where tufted Pansies are valued.—D. B. C.

Itea virginica.—Though by no means showy, this is a decidedly pretty flowering shrub, and one that, owing to the interest just now taken in flowers for butterflies, deserves a special note, for of all shrubs it is as far as I know the most attractive to the bright-coloured members of the Vanessa family, though, as recently pointed out by Mr. Wolley Dod in THE GARDEN, there is no other plant to compare in this respect with *Sedum spectabile*. This *Itea*, which is a native of North America, has been long known in this country, but it is a shrub very rarely met with. It forms a compact, freely branched bush, seldom more than 4 feet or 5 feet high. The Privet-like leaves are dark green in colour, while the small whitish flowers are disposed in dense spikes as in some of the shrubby Veronicas. These spikes are from 4 inches to 5 inches long. A cool, moist soil is essential to the successful culture of this *Itea*.—T.

in, and Again, and Again.

EN we ask you to drink Vi-Cocoa.
r. Tibbles' Vi-Cocoa is neither a medicine nor
thirst-assuager. It is a food at the same time
is a beverage, and thus answers a double pur-
the building up of the human constitution.

NOW ON

Disastrous fruit season.—In its annual review of the hard fruit crops in Kent the *South Eastern Gazette* states that the elements have again successfully conspired to ruin them. Pears, Plums, and Damsons yielded a crop much below a quarter of the average, and Apples promise a somewhat similar falling off. One grower gives an instance of the situation. In 1901 his orchards yielded 5,928 half-sieves of Cherries, and this year he could gather but 308 half-sieves. Another season like the present cannot be recalled by the oldest grower.

Uselessness of Malmesbury Carnations.—At the risk of being taken to task by some of your readers, I must say that I fail to see the merits of this class of Carnations, unless size alone is a merit, and on this subject the editor of *THE GARDEN* will perhaps have something to say in his paper to be read at an autumn meeting of the Royal Horticultural Society. Why these Carnations are so popular is a puzzle to me, unless it is that the votaries of fashion follow one another like sheep along a beaten track, for to my mind at least the huge mis-shapen flowers are positively ugly, and, except their fragrance, entirely without one redeeming feature. How rarely do we see the foliage in good condition, and then the returns in the shape of flowers are most inadequate to the space the plants occupy, the length of time necessary to obtain flowering specimens, and the constant attention required. I have seen many examples this season (and at exhibitions too) in which the plants grown in 6-inch pots carried but a single bloom, a poor return for the trouble taken. There are now so many beautiful Carnations that we can well spare these monstrosities, and when the Malmesbury section goes out of fashion few will regret their loss, and the gardener with inadequate accommodation who is called upon to grow plants equal to his neighbour with a house or houses for these Carnations alone will rejoice.—T.

Tufted Pansy Lady Warwick.—This is a grand new blue self grown in the Tamworth nurseries. The flowers are large and almost circular in form, they also have plenty of substance, which is an advantage in hot weather. The plant is of good habit and constitution, and each flower is borne on a stout erect footstalk well above the foliage. As to its freedom of flowering the plant left nothing to be desired.—D. B. C.

Tufted Pansy J. B. Riding.—Little is known of this plant, and yet no tufted Pansy (Viola) is so largely grown in our public parks and open spaces. Tufted Pansy J. B. Riding is the result of a sport from another distinct and pretty variety, William Nick, and occasionally one may see the sport repeating itself on plants of this variety. Mr. George McLeod, a most enthusiastic amateur gardener, fixed the sport in his small garden at Chingford some twelve or thirteen (more or less) years ago. I have seen it growing in many situations and aspects, and in diverse soils. Some years ago it was looking well at Kew, and more recently in Regent's Park and Waterlow Park, but I have never seen the plant, and flowers too, look better than last week in Mr. William Sydenham's garden at Tamworth. One bed, some 50 feet long by about 5 feet broad, was most effectively planted with it, the colour of the flowers being a bright shade of rosy purple. The plants were most robust and were flowering profusely.—D. B. CRANE.

BROWN ROT OF FRUIT.

(*SCLEROTINIA FRUCTIGENA*, SCHROTER.)

The Board of Agriculture recently issued a most important leaflet descriptive of this fruit rot. It is as follows:—

"This is undoubtedly one of the most general, and also the most destructive, of diseases against which the fruit grower has to contend. It attacks Apples, Pears, Plums, Cherries, and Peaches, and is also not uncommon on various wild fruits belonging to the order Rosaceae, as Bullace, Crab, &c.

"To the ordinary observer this disease first attracts attention when it appears on the fruit under the form of brownish scattered patches on the skin. This is followed by the growth of dull grey tufts

(the so-called *Monilia* fungus), which are usually arranged in irregular concentric rings. These grey tufts are composed of dense masses of spores arranged in long branched chains. The fairy-ring arrangement of the fungus is most evident on Apples and Pears; on Plums, Cherries, and stone fruit generally, the grey tufts are irregularly scattered over the surface.

"Although most obvious on the fruit, the fungus usually first attacks the leaves, where it forms thin, velvety, olive green patches. The spores from diseased leaves are washed by rain, or carried by insects, on to the surface of the young fruit, or not infrequently the flowers are also inoculated with spores derived from young leaves; and in many instances where brown and shrivelled blossoms are attributed to the action of a late frost, the true cause is in reality due to the *Monilia* fungus.

"In those instances where the disease has been allowed to follow its course undisturbed for some years, the young shoots of the trees are also attacked and killed during the first or second year. The fungus develops rapidly on such dead twigs, and furnishes a ready supply of spores, which are mature during April and May, just when the young leaves and blossom are most susceptible, and wholesale infection results.

"Fruit attacked by this disease does not rot and decay, but becomes dry and mummified. Such fruit often remains hanging on the tree until the following season. Whether it does so or falls to the ground, it is practically unchanged until the following spring, when its entire surface becomes covered with a copious crop of spores, which are dispersed by various agencies, and the disease repeats itself.

"It has long been suspected that the *Monilia* represented but one stage in the life-cycle of the fungus; this supposition has proved to be correct, the second or ascigerous form of fruit having been found growing abundantly on old half-buried Peaches in several orchards in different parts of the United States, where the fungus proves quite as destructive as with us.

PREVENTIVE MEASURES.

"All dead twigs and shrivelled fruit, whether hanging on the tree or lying on the ground, should be collected and burned during the winter. After the diseased fruit and dead branches have been removed, the trees and also the ground should be thoroughly drenched with a solution of sulphate of iron, prepared as follows:—Sulphate of iron, 25lb.; sulphuric acid, 1 pint; water, 50 gallons. Pour the sulphuric acid upon the sulphate of iron, then add the 50 gallons of water by degrees. A barrel is the best vessel to use; a metal vessel must not be used, as it would be acted upon by the sulphuric acid.

"Spraying with the above solution should be done in January or February, before the leaf-buds begin to swell in the least, otherwise the foliage and blossom will be destroyed. When the leaf-buds are expanding, and at intervals as required, the trees should be sprayed with quite weak Bordeaux mixture. The above line of treatment must be followed for at least two seasons."

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make *THE GARDEN* helpful to all readers who desire assistance no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF *THE GARDEN*, 20, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—*Invergloy*.—*Dracocephalum* (*Physotelia*) *virginica*.—G. D.—*Achillea* *Eupatorium*.—K.—The plants were unfortunately much withered when received, but we have done the best we can. The white

flower appears to be *Campanula alliarifolia*, the other *C. latifolia* var. *Houttei*. When you send again would you kindly number the specimens?

Flag Irises diseased (E. LLOYD EDWARDS).—The spots are caused by a fungus, which in some districts is very troublesome. The attacks are usually more prevalent in cloudy and thundery weather, and a close, somewhat oppressive, atmosphere appears favourable to its attack. You may certainly pull off and burn the worst of the leaves, and as a precaution you may employ, another year, a sulphur solution and syringe the plants. We do not say this to prevent the attack; it may serve, however, to modify it. At present there is no known cure, and, apart from the disfigurement, we have not noted any great harm to the plants. It is not necessary to destroy the Irises.

Curious Foxgloves (W. A. P.).—There is nothing unusual in the flower, as this abnormal development frequently occurs in the Foxglove, sometimes the bloom assuming large proportions.

Cyclamen Coum falling (Mrs. WEDGWOOD).—It is not easy to give a reason for the repeated failure, as you give no particulars of where or how planted, the class of soil, and such like. This group prefers a light and stony soil or one freely charged with old mortar. Shade, too, is important, and should not be overlooked. You do not say if your garden soil is heavy or light. The best way to establish a group of these Cyclamens would be to make the soil quite light by the addition of sand, leaf-soil, and old mortar, and if the position inclines to wetness generally you should raise the plot of ground a few inches higher than its surrounding portion. We can only account broadly for its failure by some local unsuitable condition, and a wet condition of the lower soil is much against these plants. In few weeks you will be able to plant dry roots of these plants, and in a spot such as that indicated there should be no further trouble. The near proximity of tree or shrub root or in company with Ferns, will give you an idea of the company these plants most prefer.

Copper and lime solution (Dr. Crookes).—The copper and lime solution, commonly known as "Bordeaux mixture," is made as follows: Dissolve 100z. of sulphate of copper in a little boiling water and pour it into a wooden tub. Then add five gallons of water in another vessel, and 160z. of lime, and when cool pour it into the copper solution and mix together thoroughly. Its strength may be tested by holding the blade of a penknife in the mixture for a minute or more; if any of the copper adheres to the blade more lime should be added, or the mixture may injure the foliage. Another test is to place some of the mixture in a saucer and blow steadily upon the fluid for half a minute; if a very fine scum like oil forms on the surface it is all right. If not, add more lime.—G. S. S.

Yew leaves turning brown (C. E. F.).—I have very carefully examined the shoots of Yew, and cannot discover any cause for the death of the shoots; there does not appear to be any fungus or insects on them. I should take off the diseased shoots and burn them in case there is something in or on them in the way of spores which I have been unable to discover. As to the mildew on the Hawthorn leaves, it is probably the "apple powdery mildew" (*Podosphaera Oxycanthae*), which has not been found on the Yew. The Hop mildew is quite a different fungus, *Sphaerotheca castagnei*, so that you need not fear that on the Yew spreading to the Hop.—G. S. S.

Diseased Potatoes (W. A. SMITH).—I could not find any insects or fungus upon the haulm, nor could I find anything the matter with the stems; the leaves and the appearance of having been sprayed with some fungicide. Is it possible they had, and that the mixture had been used too strong?—G. S. S.

Diseased Lilies (M. P. FORSTER).—Your Lilies are attacked by a fungus commonly known as the Lily disease fungus, belonging to a genus of fungi which at various stages of their development assume different forms, which at one time were considered to be distinct species and even to belong to different genera, consequently they are known by the name of *Sclerotinia* or *Botrytis*. The diseased leaves or stems should be cut off and burnt and the rest of the plants sprayed with Bordeaux mixture, and the ground wetted with the same mixture round the roots. Next season if the disease again shows itself immediately spray with the mixture, and again, say, once a week while there are any signs of the complaint.—G. S. S.

Delphinium diseased (V. L., Stockholm).—It is so seldom that the Delphinium suffers from mildew that we fear the attack is due to local influence, of which we have no information. The general growth of the plants is quite robust, and we surmise the plants are weak from some cause or other. As the flowering season is now past you may cut away all the stems and burn them. In March, 1904, we would recommend you to replant the entire lot, first digging the ground 2 feet deep, putting in large quantities of manure, and dividing the plants if necessary. At a seasonable time we may deal with their cultivation in a separate article. The mildew may be checked by spraying the plants with sulphur in solution.

ERRATA: "The Tulipae."—For Tulipa phoranensis please read T. Orphanides (page 77, August 1).—In our issue of the 18th inst. we have misplaced a paragraph in the notes on "Indoor Garden." The paragraph headed "Tulips" should have followed the paragraph headed "Roman Hyacinths." Placed as it is it is quite confusing.

Mr. H. Bennett.—We regret to hear that Mr. H. Bennett is leaving the well-known gardens of Sir John Heathcoat-Amory, Bart., Knightsbridge Court, Tiverton, Devon, on account of bad health. These gardens are noted for their hardy flowers.

THE GARDEN

No. 1657.—VOL. LXIV.]

[AUGUST 22, 1903.]

A STEP FORWARD.

A YEAR ago, and then not for the first time, we called attention to a scheme which, under the title of "Garden Cities of To-morrow," has of late been brought powerfully to the front. The exodus from the rural districts, scarcely noted in its early beginnings, has by degrees arrived at such alarming proportions that town folk and country folk alike unite in deploring its consequences; while political economists, taking a wider outlook, discern the cloud, no bigger than a man's hand, of national decay rising in premonitory mist on the horizon of national prosperity. It is much easier, as we all know, to sit down with folded hands and utter gloomy forebodings than to suggest a practical remedy. It is not surprising, therefore, that the scheme of intermarrying town with country, so ably put forward by Mr. E. Howard, should have attracted a sympathetic following from amongst earnest-minded men and women of all shades of political and religious opinion. Certain it is that the past year has seen a great advance in a great industrial movement, and we can no longer regard the project as being merely "in the air." Already we are on the eve of learning that a suitable site has been obtained, and we may be sure that the active promoters of the enterprise, who are practical business men, will not rest until one such garden city as has been foreshadowed shall have become an accomplished reality.

We could wish for a name more worthy of a noble inspiration. Garden City is too suggestive of Yankeedom to be quite in accord with good English taste. But the idea is grand and magnetic, inasmuch as it brings a sense of relief to the awakening public conscience. Most of our readers, all of whom we may assume to be garden lovers, rejoicing in the freedom of clean air and light and the beauty of tree and flower, must sometimes give a pitying thought to the crowded, airless courts and alleys, haunted by pale-faced slum children who have at hand no better playground. A vision, doubtless, rises now and then to disturb the peace and obscure the brightness, if but for a passing moment, of well-appointed homes. It is a vision of huge tenement buildings—erected at enormous cost and with every best intention—yet found to be utterly inadequate to give healthy and happy house-room to the decent folk who overflow into them even before they are fit for occupation.

Most gladly and thankfully, therefore, do we all turn to the comfort of a new hope and the prospect of a better future for some, at least, of the toilers, who meanwhile are condemned to crowd into such congested areas. It is hard—perhaps impossible—for those who all their lives have enjoyed, as a matter of course, the luxury of more or less breathing space, to realise what it would mean to be transplanted from a cramped-up family abode of two or three rooms in grimy surroundings and set down in a fair-sized home occupying 20 feet by 130 feet, and giving scope for a strip of garden ground. This, we understand, is proposed as the minimum space for the accommodation of a family of five or six members. Mean and narrow as it might seem to many of us, it would be like heaven itself to thousands of our working brothers and sisters. Let us at least wish the movement well and bid God-speed to those whose far-seeing energy has begun to lift the curtain which seemed too heavily weighted to rise, and who have already let in the dawn, let us hope, of an ever-brightening day.

The pivot upon which the whole enterprise turns is not the town and its buildings so much as the land to be acquired and its apportionment in perpetuity under wise and competent authority. Given space and ordinary natural advantages, the laying out of public parks and gardens presents no great difficulty. It has been done many times, and done well, and to maintain order and beauty is a matter which may safely be left in the hands of the municipal rulers to be. But it does occur to a practical mind that a goodly number of private garden plots suddenly put into the uncontrolled tenancy of a town-bred population might be doubtfully well managed as a whole. Even rural England is sometimes not altogether lovely in the matter of well-ordered gardens. One cottage may be a picture, embowered in Roses and Woodbine, with brightly-coloured flower borders half hiding the well-kept beds of vegetables, while the next-door neighbour may care for none of these things, and may leave the precious soil to become a nursery of noxious weeds. In a well-equipped organisation calling itself a garden city control of some sort would seem to be imperative, yet not so rigid as to interfere with individual independence—the Briton's birthright.

A modification of some of the Continental methods of public instruction in cultural and kindred matters might well be included from

the first in the municipal enactments. An educational garden, supported by small periodical payments, not necessarily compulsory, with one or more district gardeners to give help on occasion to those who, either from ignorance or incapacity, might be in need of it, would be a boon to many a working man and woman, whose up-bringing had failed to qualify them for quasi-rural life. In the present connexion we offer this as a mere suggestion in the interests of a comprehensive and well thought-out scheme, which, we trust, may before long make a prosperous start. But we also hope in time to see educational gardens of one kind or another become general throughout the length and breadth of the land, so that it may be true of our own country, as of many others, that not a square yard of garden ground is wasted, but turned to the best account by a thrifty people.

THE FRUIT CROPS.

In an experience of fifty years I am unable to recollect such a general failure of fruits as we have to record in 1903. In former years, where one district has failed, another has garnered a full crop; but in the present season the failure seems to have been general throughout the British Isles. Dealing first with what are called in Kent "the hard fruits," except in sheltered gardens with suitable walls, the Pear crop may be considered an absolute failure, even those varieties which we have hitherto considered as annual bearers are barren in the open. The only sorts which have a sprinkling in our nurseries are Colmar d'Ete, Emile d'Heyst, and Louise Bonne of Jersey. In the market orchard varieties, the "Chalk" or Crawford and the Hessel have a sparse crop, though the Pear blossom this year was exceptionally fine. Even trees recently moved, and therefore carrying thoroughly ripened wood, were unable to resist the long continued wet, cold, and frost of May and June.

Coming next to Apples, although they flowered much later than Pears, the trees are perfectly bare in the Kentish orchards, except here and there where they were sheltered from the cold winds. Both those Apples which flowered early, as well as those which blossomed very late, have equally failed, and probably the largest crop of any kind will be the Old Keswick Codlin. It is notable, however, that Worcester Pearmain is bearing very well; the reason of this may be because the tree is naturally thin and woody, and the fruit is gathered sufficiently early to allow the tree to recover itself, and it is also a sort which ripens its wood early. Here and there fortunate growers have secured very high prices for their orchards, but, as in some cases the trees have been neglected, and in others thoroughly

well cultivated, it is difficult to arrive at the cause of this discrepancy.

Owing, therefore, to the fact that Apple trees moved in the years 1901 and 1902 are carrying more fruits than trees established for a longer period, we may presume that the loss of fruit in some cases is due, not only to the spring frosts, but also to the unripened state of the wood, owing to the wet season of September and October, 1902, when the wood, being sappy, was severely tried by the sharp frosts we had in November, and to the same cause we may also attribute the curl which attacked the foliage of Peaches and Nectarines on walls.

To return to Apples, the following sorts are bearing more or less fruit: Allen's Everlasting, Allington Pippin, Baumann's Winter Reinette, Ben's Red, and an introduction of our own from Cornwall, Bielo Borodawka, Bismarck, Cardinal, Cellini, Colonel Vaughan, Duchess Favourite, Early Victoria, Ecklinville, Foster's Seedling (very heavy crop), Golden Spire, Grenadier, Hornead Pearmain, James Grieve, July Pippin, Keswick Codlin, Lady Sudeley, Lane's Prince Albert, Lord Derby, Lord Grosvenor, Pott's Seedling, Sanspareil, Seaton House, Stirling Castle, Yellow Ingestre, Tower of Glamis, White Transparent, and Worcester Pearmain, but on none of these is there what we may call a good crop, and in many cases the fruit is much spotted with fungus.

In a garden laid out by my firm in 1901-2 the Apple trees are bearing extremely heavy crops. Arguing from this fact, it is quite evident that if we wish to secure a regular crop of Apples a portion of the garden trees in every establishment should be annually lifted and root-pruned in order to encourage that ripeness of wood which alone seems able to resist inclement spring weather. This root-pruning cannot, of course, be carried out in market or orchard culture, but if these trees, both young and old, were gone over in August and all superfluous inside shoots were removed, and also a thorough winter pruning and thinning of the boughs were carried out, the sun and air thus admitted would no doubt tend to the same end as root-pruning, and thus secure a valuable crop in inclement seasons. As what little hard fruit there is this year has sold for two and three times its usual price, it will amply pay the growers to give their attention to this matter.

To come now to other fruits, the most important are Plums. As far as my experience has gone, these are bearing best this season where they are on grass land, that is to say, where the trees are not making that strong, sappy growth which they do in cultivated ground. Naturally, position and shelter may also have saved a crop in some favoured localities, but taken all round it is the shortest crop ever known. The only orchard sorts which appear to be bearing are The Czar, Monarch, Pond's Seedling, Diamond, Early Orleans, Prince of Wales, and Jefferson. The Gage tribe appears to be an entire failure, as also are all the Damsons and Bullaces.

Cherries never bloomed more profusely, but the continued cold weather prevented any development, and though many sorts reached the stoning period, they fell off at that time. Here and there orchards produced a quarter of a crop, but there must have been many acres where not a ladder was put into the trees. Curious to say, however, Morello Cherries in the open have borne well.

Gooseberries came through the severe ordeal better than was expected, and in some districts even full crops have been gathered. As the market prices have been exceptionally

high, growers have been partially recompensed for their loss upon other fruits.

Black Currants were a very short crop; Red Currants about half a crop, but they have been of good average quality and have made very high prices, doubtless owing to the fact that the jam maker's stocks were low in consequence of the failure of Plums for two successive years, making them anxious to secure a good stock of other fruits.

Raspberries have been a very partial crop, individual berries not having grown out to their usual size, but here very high prices have recompensed the growers for this deficiency.

Strawberries, excepting the earlier pickings, which were considerably damaged by the wet and cold weather, proved a very good crop, and have made remunerative prices, which would have been much higher had not the Kent, Hampshire, and Cornish fruit been practically ripe at the same time instead of

CYRTANTHUS ODORUS.

following each other as they do in a normal season:

With regard to wall fruit, Peaches, Nectarines, and Apricots have all been an indifferent crop, and, owing to the want of sun, the fruits are deficient in flavour, both under glass and outside.

It has been suggested that growers might protect considerable areas of land with a cheap covering of canvas, but, as these abnormal seasons come so seldom, this expense would not be warranted. The only thing I can suggest would be that growers should plant fruit on various aspects and give it the attention advised.

Naturally, the greatest amount of cold wind may be expected from the east in the spring; but the wet and cold of June was accompanied by strong winds from the west, so that no general rule can be given, and so remarkable has been the dividing line between a fair crop and none at all, that in one instance a half crop of Cherries were grown in an orchard on one side of a road, while on the opposite side there was scarcely a picking.

Therefore, neither in reference to position, soil, aspect, cultivation, or quality are we able

to predict with any certainty as to the probable crop's future.

It is, therefore, abundantly evident that a grower who pays attention to careful pruning, even when the trees are not bearing a crop, and liberal mulching when a crop is set, will come out best over a series of years. And even if a grower has lost his crop in a bad year, he must not be disheartened, but persevere in the best cultural methods, in which he will find his due reward.

GEORGE BUNYARD, V.M.H.
Royal Nurseries, Maidstone, Kent.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

CYRTANTHUS ODORUS.

This South African species was sent recently. We have made a little sketch to show the character of the flower. (See page 89.)

FLOWERS FROM DEVONSHIRE.

Mrs. Bayldon sends from Oaklands, Dawlish, Devon, many charming flowers, especially interesting being the

HYDRANGEAS,

with the following note: "I send a few Hydrangeas for your table. The little bit is *H. Hortensia Mariessii*, one-fourth of one head of bloom, but it was still in bud. It will be grand in about a week's time. The white is *H. H. Shirogati*, pinkish lavender, and the other is *H. H. lindleyana*. It is a sheet of bloom. Several other Hydrangeas are not yet out, such as *H. paniculata grandiflora*, *H. quercifolia*, and *Pride of Cornwall*, a Japanese Hydrangea. The *H. Hortensia* forms are interesting as showing the effect of our dry soil charged with iron. The flowers were taken from groups planted yearly for some years past. Last year's is the large head of deep pink, and the small heads of pale blue flowers are from plants put out five years ago. You will notice how the pink fades, then gets a lavender tint, through puce to blue. When fully open the flowers become a full blue."

OTHER INTERESTING FLOWERS.

Mrs. Bayldon also sends the beautiful *Tamarix hispida*, very fine clusters of *Olearia Hassii*, and several varieties of *Ceanothus*. "The young bushes are covered with bloom, and are wintered without protection. *Buddleia variabilis* is also out, and *Colutea melanocalyx*, a yellow-flowered shrub." Our correspondent writes: "By making a careful selection of shrubs and shrubby climbers we are practically never without some either in flower or in fruit, and certainly they are far more useful, and, indeed, beautiful (at any rate in large gardens) than so many beds of flowering plants. We have *Rhododendrons* for six months of the year." Mrs. Bayldon also sends the beautiful foliage of *Rosa rubrifolia*, with the following remark: "The Rose foliage is *R. rubrifolia*. The Rose is grown simply for its foliage, and the more it is cut from the stronger it grows. It is beautiful in a mass and for colour effect."

NEW PEACH PEREGRINE.

Messrs. Rivers of Sawbridgeworth send a new Poach, which is excellent in all ways. It was shown before the Royal Horticultural Society on Tuesday last, and received an award of merit. A group of this new Peach was staged last week at Bishop's Stortford show, and was greatly admired.

We have never seen pot trees fruit more freely. It forces well. Messrs. Rivers describe it as a midseason Peach, and a little earlier than the well-known Crimson Galande. Peregrine is not unlike Crimson Galande in colour; it is also a large fruit, and crops freely. The flavour is first-rate. This is an important point, as, though size and colour are the first market considerations, flavour is more so when a fruit is grown for the house. It is, we believe, a seedling from Spencer Nectarine, and this makes it more interesting, as showing how closely the Peach and Nectarine are allied. Some of the midseason Peaches do not force well, but this variety is an exception; 12-inch to 16-inch pots carry a remarkable crop. Messrs. Rivers have during the last quarter of a century given fruit growers so many valuable fruits that any new introduction from Sawbridgeworth is always looked forward to with interest by those who make fruit culture a special feature. It is always a pleasure to grow fruits raised in this country, as they are harder than others, and therefore better able to stand our variable climate.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

August 25.—Rothesay, Oxford, and Brighton Flower Shows (two days).

August 26.—Reading, Bath (two days), King's Lynn, and Harpenden Horticultural Shows.

August 27.—Sandy, Ellesmere, Stirling, and Dundee (three days) Horticultural Shows.

The Royal Horticultural Society's new garden.—In view of the large number of letters I am receiving asking if Wisley Garden can be visited by Fellows, will you be so kind as to permit me to say that at present the property has not yet been handed over to the society, and that none of our officers are there as yet. It is therefore impossible to open it to the Fellows at present. In fact, some few months will probably elapse before that can be done, but due notice will be given to all Fellows as soon as ever it is possible.

Sundries tent at Chiswick.—May I ask you to be so kind as to say that the council have consented to have a sundries tent at Chiswick on September 29, 30, and October 1 in precisely the same way as they did at the last Holland House show. Application for space should be made to Mr. Wright, Royal Horticultural Society Gardens, Chiswick, W.—W. WILKS, *Secretary*.

Lecture on the Hollyhock.—In the garden of the cottage and in many a wayside country garden the Hollyhock is pre-eminently the flower of the moment. On Tuesday last, at the instance of the Royal Horticultural Society, Mr. Webb of Saffron Walden treated the flower generally and its propagation. And what we gather from this lecture by a specialist of many years standing—and of which a brief summary is given in another column—is distinctly encouraging to the would-be grower, and to the amateur in particular. We are in absolute agreement with regard to the system of raising these plants in the most hardy way possible, so much urged by the lecturer, for it is a most vital point in connexion with their ultimate success. We may, perhaps, regret that the lecturer made no mention of the beautiful single Hollyhock. At the moment, we have in mind some really good effects from these single sorts, and though the spikes are not less than 8 feet high, and lined with flowers for some 3½ feet of their length, the plants have practically no cultivation whatever, and, growing in a rather poor and stony soil, have certainly no disease. For a couple of seasons have these plants flowered so, and their many beautiful shades of colour, and not less the great array of spikes, call forth much praise from the passer-by. What we admire, as we view these plants from time to time, comes in the knowledge at our disposal that they wintered with no protection, where they flowered a year ago, and now, with a complete exposure to all the vicissitudes of the year, are in greater bloom and finer array than ever. What greater substan-

tiation of Mr. Webb's treatment could there be? The general public will be well advised if they go and do likewise. In the remarks by Mr. George Gordon, who was in the chair upon the occasion, mention was made on behalf of these single-flowered sorts; and surely they merit all that was advanced in their behalf. We are pleased to note in many directions that this much-prized flower, which has been in a decline, so to speak, through many years, is likely to—in Nature's own way—regain the old-time prominence in our gardens. It is not only Nature's own way, this method of raising from seeds, it is also the most rational as well as natural way of restoring that great fund of vitality lost to these plants through many years of over, or perhaps of excessive cultivation by over ambitious florists and gardeners. But on the principle of "never too late to mend," and by the learning through much loss and sacrifice, a great fundamental truth, we now return to seed raising for this highly ornamental group. That its revival will be hailed with satisfaction in many directions we have but little doubt, for as a garden flower the Hollyhock is quite unique, and this from every standpoint.—E. H. JENKINS.

Warley Cottage Garden and Farm Produce Show.

—We are pleased to know that on September 3 next the fifth annual show for the parishes of Great and Little Warley will be held at Warley Place. The president is Miss Willmott, V.M.H.; the honorary secretary and treasurer Colonel Whittington, C.B., Codham Hall; and the assistant secretary Mr. Preece, Warley Place Gardens. There is a long list of most generous prizes for amateurs and cottagers, and the Royal Horticultural Society will give a medal to be awarded by the judges to the exhibitor who wins the greatest number of first prizes in the show. Several special prizes are given by Miss Willmott, who also gives to anyone living in Great or Little Warley plants, seeds, and bulbs for their gardens. It is most praiseworthy work to encourage the villagers to interest themselves in their gardens and in the land. We only hope that such an example will be followed in other districts.

Success with *Iris reticulata*.—In the autumn of 1898 I planted three bulbs. I divided my clump about the middle of the present month and found, of all sizes, 168, of which at least 100 are of flowering size. They were much crowded, and I look for a fine show next spring. In view of the difficulty sometimes experienced in growing this *Iris* I may mention that the soil in my bed is a very light one—a mixture of loam, leaf-mould, road sand, with plenty of old mortar rubbish—and the situation is sheltered and well drained.—CHARLES PRENTIS, *Bankside, Milton, Sittingbourne*.

Bamboos flowering.—So many instances have been mentioned lately in the pages of THE GARDEN of Bamboos flowering this summer that it may be worth recording that both *Phyllostachys Henonis* and *Arundinaria auricoma* are now in bloom in this garden; one specimen of *P. Henonis* is literally all flower.—LOUISA WAKEMAN NEWPORT (Mrs.), *Sandbourne, Bexley, Worcestershire*.

"The robin sings again."—I was greatly interested in reading "E. K. R.'s" notes of "The robin sings again" in last week's GARDEN. Your correspondent mentions that he knows of no sound more suggestive of winter than the trill of the robin. I quite agree with him. We have a very rare occurrence, I think, in the gardens here, and that is a nest of young flycatchers fully fledged and about to fly at the time of writing (August 17). I think it must be unusual to see such a late hatch in the North.—J. S. HIGGINS, *Rug Gardens, Corwen, North Wales*.

Irish Gardeners' Association.—The second excursion of the season, organised by this society, took place on Wednesday, the 12th inst., to Carton, the seat of the Duke of Leinster, at Maynooth. Leaving Dublin at noon, the members were met on arrival at Maynooth by Mr. Black, who conducted the party over the gardens, which extend to about a thousand acres. There is much to interest lovers of gardens at this historic seat. Many fine conifers are here, and open grassy woodland glades afford delightful prospects. Hardy

herbaceous plants are grown in enormous quantities, and the variety and extent of the collection was the subject of much interesting comment. Flowering shrubs, too, are a feature, and include many interesting and rare kinds. The ornamental waters, the pergola, and the contents of the various glass houses all contributed to the enjoyment and instruction of the visitors. Nor were the various objects of antiquarian interest, which the neighbourhood affords, neglected. Maynooth College was also visited. Tea had been provided by the organisers of the expedition. After a vote of thanks to Mr. Black, whose guidance had done so much to ensure the success of the outing, the party left for Dublin.

Hardiness of *Fraxinus Mariesii*.—I am anxious to find out whether this beautiful little tree is likely to prove really hardy in this part of the Midlands. At Bath Botanic Garden it forms a small tree, which at the end of June was covered with fine creamy white panicles of blossom, contrasting well with the smooth and shiny bronzed-tinted foliage. It appears to have been introduced to cultivation about the year 1880, and was figured in the *Botanical Magazine*, but has not become generally known. I fancy it is not often planted, as one seldom meets with it. It was described by Maries, who discovered it when collecting for Messrs. Veitch in China, as a small tree found in the province of Kin-Kiang. On the whole it should perhaps be regarded more as a shrub than a tree, and, though it is thriving well both at Coombe Wood and Bath, it is not by any means a quick grower. As to its hardiness, I am informed that 30° (Fahr.) of frost have done it no harm near London, but if any readers of THE GARDEN can tell me anything of its behaviour further north I shall be glad. The panicles of blossom are large and fine, and in colour much like the blossom of *Spiraea arifolia*.

***Thymus carnosus*.**—This Thyme is well adapted for rockwork on account of its neat growth. In spite of the fact that it is a native of sunny Spain, it manages to survive our winters, although it sometimes suffers from frost. My experience goes to prove that it should not be planted where the early morning sun reaches it, and it was not until I moved my plants from an open south position to one where they were shaded almost up to midday that I was able to keep them from being injured in severe weather. One would hardly recognise this plant as a Thyme, so very distinct is it from all the other members of the genus. My plants, which are about 9 inches to 12 inches in height, form erect little bushes, and emit a sweet fragrance when touched. The fleshy, dark green leaves are very distinct, as they terminate in a point, and instead of being flat they are rolled back until the edges almost meet. The stems are brownish and covered with a slight pubescence. I find it is quite easy to propagate, and small cuttings taken now and dibbled in moist, sandy loam will soon take root. As a flowering plant it is of little value, as its white blossoms, which are produced during late July and August, are rather inconspicuous. During the winter, however, a little group of plants looks most effective on rockwork, and only want to be seen to be appreciated. Plants a few years old rather resemble miniature conifers at a distance, and are very neat habited when well grown. *Thymus carnosus* was first discovered and described by Boissier, and must not be confused with *T. comosus* (Heuf.), which I see frequently mentioned in catalogues as a distinct species, but which is really a Transylvanian form of *T. Chamædryas*.—ARTHUR R. GOODWIN, *Worcestershire*.

Flowers at Far Forest.—Keen interest is taken in horticulture and agriculture by the Rev. G. F. Eyre, the vicar of Far Forest, and the second annual display was held recently in a field opposite the vicarage. It was a general show, as much of it was devoted to agriculture, and it is pleasant to see the clergy of a parish encouraging their parishioners in things that concern the garden and the land. It is a wholesome and praiseworthy work. The late President of the Board of Agriculture, Mr. Hanbury, had accepted the presidency of the show, and had promised a donation of £5, which has been kindly given by Mrs. Hanbury. The show has also

been fortunate in securing as patrons (who gave subscriptions of over £1) Lady Scourfield, Mrs. Betts, Mrs. F. J. Eyre, Mrs. G. F. Eyre, Mrs. Constantine, Rev. F. A. Reiss, Mr. A. Baldwin, M.P., Mr. J. S. Lea, Mr. E. Smith, Mr. A. K. Betts, and Messrs. Meredith Brothers. There is also a good list of vice-presidents and honorary members; while hard-working committees spared no efforts to ensure the success of the gathering. The committee consisted of the Rev. G. F. Eyre (chairman and treasurer), and Messrs. A. K. Betts, W. Jeans, D. Stokes, C. Green, J. Tarling, F. Bint, Walter Booton, and J. Bullock (hon. secretary). In the flower show the officers were assisted by a sub-committee, consisting of Messrs. W. Simmonds, E. G. Keeley, A. Meacham, R. Bellingham, and F. Baynham. The schedule was wide and comprehensive, and the classes, except those for fruit, were well filled. The season, as everyone knows, has been an exceedingly bad one for fruit throughout the country, and Far Forest district is no exception to the rule. The total number of entries was within one or two of 200.

Wallflower-leaved Stocks.—In the trial of various East Lothian and summer Stocks, now seen in the Royal Horticultural Gardens, Chiswick, are two white-flowered Wallflower or glossy-leaved Stocks that greatly resemble each other yet seem to be very different. Both are, however, remarkably good. White flowers on the green-leaved plants are much more effective than are white ones on the whitish or woolly-leaved plants. The earliest, and, so far, rather the most bushy, is East Lothian white Wallflowered. Some plants carry from nine to ten fine spikes of pure white, double flowers, and not above 9 inches in height. The other is All the Year Round, which is, so far, rather later, and, in that respect, seems to be distinct from the other. This variety gives 80 per cent. of doubles. Its merits as a winter bloomer in a greenhouse, grown in 5-inch or 6-inch pots, some four to five plants in each, are well known. For purity of colour and for sweetness of perfume All the Year Round cannot be excelled.—D.

Rosa rugosa Blanc double de Coubert.—All the Rugosas are valuable Roses, not so much for their flowers as for their handsome fruits. None is more beautiful or so sweet scented as Blanc double de Coubert. It is of the purest white, semi-double, and continues in flower the whole summer and autumn. It lasts in flower a little longer than the single varieties; each flower is quickly succeeded by another. I have never met with a Rose so sweet scented. A good group of it fills the air with its sweetness. It will succeed in any fairly good soil or situation. I saw a very large group of it growing in absolutely wet soil on the 1st inst.; in fact, it was called a bog garden, and certainly the water was within a few inches of the surface. It is also growing here under very different conditions, viz., dry light soil, but perfectly happy. It makes a delightful edge, or is splendid for planting on the tops of sunny banks, where it can have room to grow down the slopes. In this way it is seen at its best.—A., Cirencester.

Neglect of the Lantana.—This is another family which has been much neglected. It is very closely related to the Verbenas, and equally deserving of being again revived. Within the last few years, however, more attention has been given to them, and some improved and distinct varieties have been raised. It is to Continental raisers that we are most indebted for improved varieties. Drap d'Or, a beautiful golden yellow, which flowers freely when planted out, is one of the most desirable varieties; Chelsea Gem, a bronzy red, is also good, and there are some pure white and pink varieties. Like the Verbenas they may be readily raised from seed, and if from a good strain they will nearly all produce flowers equal to those of the named sorts, but of course the colours vary. It is, therefore, better to select the best from seedlings and propagate the following season from cuttings, which root freely under the same conditions as Fuchsias. The stock plants, too, may be treated in the same way. To secure good plants for bedding they should be propagated early in the season, and they require a rich compost and to be

grown on in warmth. If they receive a check, either for want of potting or from cold, it will be a long time before they start into free growth again, but give them a little care early in the season and they will continue to flower throughout the summer. There were few things which attracted more attention at the Holland House show than the four distinct varieties of Lantanas exhibited by Messrs. Cuthush and Sons, and the large group of seedlings exhibited by Messrs. Watkins and Simpson a year or two ago well illustrated what a variety of shades may be had from carefully selected seed.—A. HEMSLEY.

Clematis montana var. rubens.—Clematis montana is such a splendid garden plant that my interest was greatly aroused when hearing that Mr. Wilson had discovered a pink-flowered form in China. When at Coombe Wood early in the summer I was shown the original plant, and, though it had then long passed out of flower, I noticed immediately that it was quite distinct on account of the fact that both its stems and foliage were of a very pretty purplish shade. There certainly are some remarkable plants at Coombe Wood, and to mention only a few, I noticed Vitis armata, with fine bronze-tinted foliage and sharp thorns; Rubus Henryi, a lovely species, with beautiful shiny leaves; Rubus lasiostylis, with peculiar white stems 6 feet high, covered with short, cream-coloured thorns, and the underneath surface of the green leaves covered with white. There are also numbers of new Clematis species at Coombe Wood, and many of these will, no doubt, be of great service to the hybridist in the future.—ARTHUR R. GOODWIN.

Genista æthnensis.—In various parts of the gardens at Kew large bushes of this shrub have been flowering gloriously for several weeks past, and are still (August 1) in good condition. In addition to being a really good flowering shrub it is very graceful, and is of considerable merit when not in bloom. When a shrub combines these qualities we would expect to find it in evidence in most gardens, but this is not the case, for specimens, more especially good ones, are rarely met with. That its scarcity is not due to the plant being new can be readily seen, for it was described by Loudon, and he gives the date of its introduction as 1816. It is said to be found wild on Mount Etna at an elevation of 6,000 feet, in company with Acer monspessulanum, and from its habitat the common name of Mount Etna Genista is taken. Loudon, in his description, gives the height as from 2 feet to 4 feet, but this is incorrect, the specimens at Kew being in many cases 15 feet high. In habit it is extremely graceful, the branches being light, slender, and drooping, while the leaves are very small and few in number, so that there is nothing to give the branches any appearance of heaviness. The flowers are small and yellow, and borne singly from almost every node on the young wood. When in bloom the bright green branches, garlanded with bright yellow blossoms, make a charming picture. Some idea may be gathered of the eight a single specimen makes when it is stated that a plant 15 feet high and 10 feet through is simply a mass of gold, with the green of the branches peeping out here and there. No special cultivation is required for this shrub or small tree, as it will grow well in quite poor, sandy soil, and is easily increased by seeds or cuttings. When it is first planted out in permanent quarters every plan should be provided with a stake, as the roots are rarely in sufficient quantity to keep the plants secure until root action is renewed. G. æthnensis is an excellent subject for groups in the park, for isolated specimens, for beds in prominent places, or for the shrubbery, and in whichever place it is planted it will find admirers.—W. DALLIMORE.

Uncommon bedding Begonias.—Whether the few varieties of dwarf double bedding Begonias now flowering in beds at Chiswick do or do not show their true forms it seems evident that they represent a very dwarf, compact, free blooming strain, one that will doubtless in time be generally used to the displacement of the large-flowered and large-leaved varieties that are so gorgeous in pots but seem to be far from desirable bedding plants. Hitherto the rich crimson-scarlet double Lafayette,

one of the most brilliant of all bedding Begonias, has been most favoured. Of the Chiswick varieties there is one that bids fair to rival, if not to excel, that variety. It is named Argus; has bold, erect, double flowers of a beautiful orange scarlet, and these produced quite freely on plants but 6 inches in height. There is also Hollyhock, a charming soft rosy pink double, that is very dwarf and free blooming, and makes a capital companion plant. These seem to be the best at present of the varieties now flowering at Chiswick.—D.

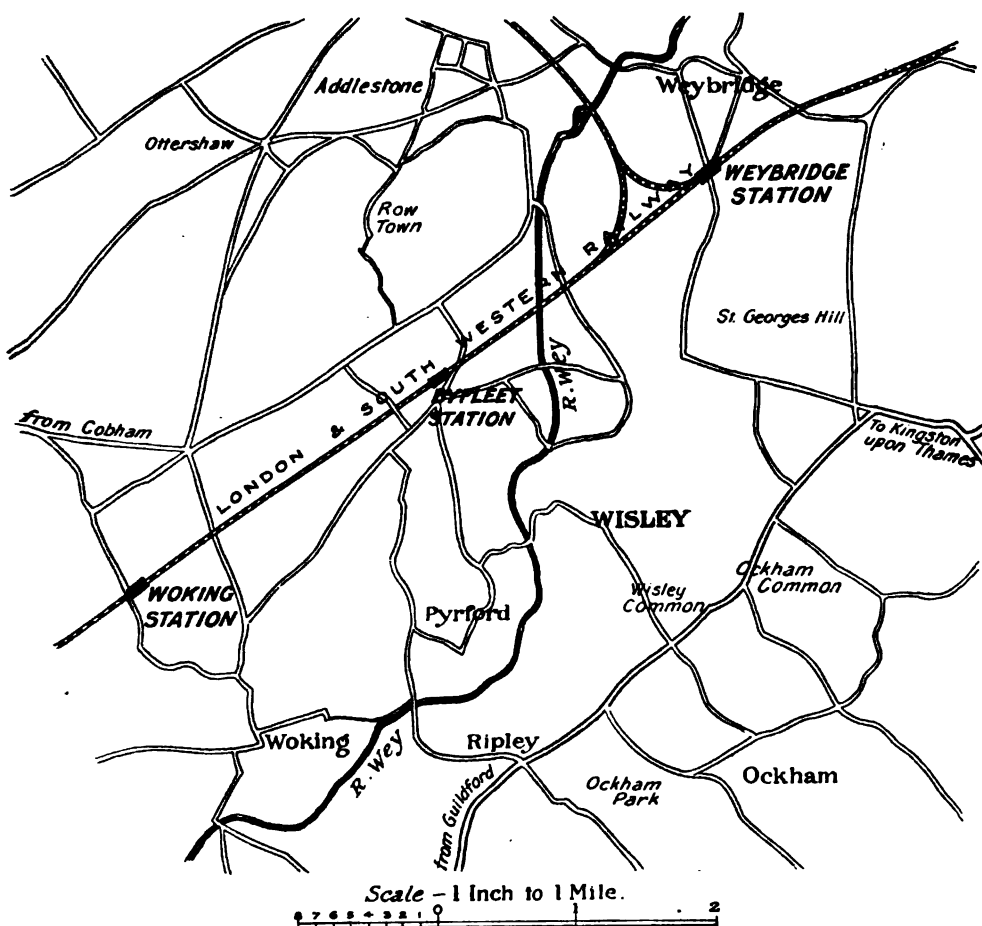

Begonia Lafayette.—The first time I saw this Begonia bedded out was in Miss Alice de Rothschild's beautiful garden of Eythrope. I have since seen it effectively used at Arundel Castle and Hampton Court. For brilliancy of colour, its crimson-scarlet flowers (a combination of the two) give the most dazzling and brilliant bit of colour of any plant I know. The plant is not a robust grower, therefore it requires planting rather thickly. For lines or bold masses of colour it is invaluable, as it also is grown as a pot plant for room or conservatory decoration.—T. E.

Lilium candidum.—The prettiest garden picture I have seen for a long time was in a garden at Ealing. Walking along the Gordon Road recently, and admiring the many well-kept and beautiful gardens for which this part is famous, I was particularly impressed by the beauty and interest of one place. As usual the garden was enclosed by a well-kept Privet hedge, the walls of the house, windows and doors wreathed with Roses, Honeysuckle, and Clematis, the narrow borders each side the path, leading to the door, loaded with Roses on standards in the richest luxuriance, and the base of the beds made bright with Begonias, Geraniums, and Calceolarias; but it was not these flowers—beautiful though they were—that so riveted my attention, it was a mass of this beautiful Lily planted on the square bit of turf facing the windows. They were between 4 feet and 5 feet high, and what gave further interest to the picture was the fact that a child stood behind the Lilies in the act of securing them to the stakes. There are few positions in the garden that this old Lily would not grace and beautify, but I never remember seeing it before with such pretty associations.—E.

THE NEW GARDEN OF THE ROYAL HORTICULTURAL SOCIETY.

SIR THOMAS HANBURY'S GIFT.

I WENT at the close of last week to Wisley, and found a somewhat narrow and by no means an attractive lane from Byfleet Station the shortest way; it was just about three miles distant. Somewhat in doubt as to the actual fitness of the gift for the purposes of the Royal Horticultural Society, and still feeling that the Limpsfield site was the best, yet I came away with the conviction that I had seen a wonderful and beautiful garden, one so utterly unlike the average garden, yet so overflowing with interest and with floral variety, that its value to the society can hardly be overestimated. It is a garden that no mere pen sketch can do justice to, and even the best of pictures will fail to depict what is there to be seen. Wisley Garden is the most perfect example of a wild garden I have seen. With plants of almost every description suited for cultivation there, not only are the things in it in a sense growing wild, but there has been no attempt to graft formality on Nature. One sees no formal paths, no ordinary beds or borders, and what of art has been utilised is of so simple and so unpretentious a character that it looks quite natural rather than structural. Modern rockwork, as so often seen, appears so artificial when compared with the simple formations seen at Wisley, that really the garden looks as if, from some central piece of planting, like a mossy Saxifrage, it had grown naturally. Certainly it developed bit by bit, and all on the same lines. There are no modern surprises, but there are many plants, shrubs, and trees in varying elevations; there a mass of waving Bamboos, a grand Gunnera manicata, and in another spot a floor of

PLAN OF THE NEW GARDEN OF THE ROYAL HORTICULTURAL SOCIETY.

(The quickest way, perhaps, to get there is to go to Weybridge. There are frequent fast trains from Waterloo, and cabs at station. The next best is Horsley, on the new Guildford line, but the service of trains is not quite so good. There is very little difference, however, between the two. Horsley is near Ripley. For full description of garden, see THE GARDEN of last week, page 105.)

Primulæ, a small ravine of Ferns, or myriads of other things. But all the same the garden is quite a natural one, and is for that reason all the more delightful. Although planted with things, so many of which are so rare and as little known, there are no labels. Mr. Wilson would not have them. He did not want them; he knew all the plants, as now the prime moulder of the garden, Mr. Tatnall, does. However, in other parts it may be needful in future to name products. At least, may this monument to the late Mr. Wilson—this beautiful wild garden—never be desecrated by labels or by any attempt at improvement. It should be carefully preserved. Those who have not seen it, as they now should, and all who have seen it, will surely join with me in demanding that no effort be made to alter, vary, or destroy one bit of what Mr. Wilson so lovingly accomplished.

Whenever the council of the Royal Horticultural Society shall take over the garden, though probably they will consult the Fellows' wishes first, they will find in the forty acres of comparatively open land that surrounds the garden ample room for the conducting of all descriptions of trials and experiments, practical and scientific. They will also find a capital soil, as all natural growth about there testifies that it is. There is not the least probability that thus remote from a railway, and with the huge area of Wisley Common adjoining it, that the vandal hand of the builder will ever encroach upon this beautiful locality. That a light railway will run through this beautiful district is little likely also, for residents in numbers there cannot be. The council will have to expend money liberally to provide glass houses, residences, stores, sheds, stabling, walls, fences, and many other things, without which a new Chiswick will be impossible. That

its remoteness from a railway station is an objection there can be no doubt, and forms a somewhat formidable obstacle to the garden's complete usefulness. The nearest and best station is Horsley, on the new Guildford line, twenty-two miles from Waterloo and three miles from the gardens, going through Ockham into the Ripley road. Vehicles can be got there, as also they can, of course, at Weybridge, which is nineteen miles from London, and between five and six miles from the garden. Woking is even rather further away. A. D.

THE FLOWER GARDEN. IMPROVEMENT OF THE HEUCHERAS.

THE Heucheras as wild plants are so weedy that it is doubtful if the genus would ever have received attention had not *H. sanguinea* been introduced; and the persistent failure of *H. sanguinea* to grow and flower well has promoted efforts to produce as beautiful a flower, or even more so, that will do well.

There are but four species that are of any real value, but the careful hybridisation of these has resulted in a dozen good plants of a type that could be recommended for the best garden use, and whose flowers are not only highly coloured, as Heucheras go, but graceful withal. It has been said that they, and more like them, are needed. Heucheras now hold a firm place in the affections of the hardy plant lover. They require a rich soil, a warm position, and cultivation does not cease with planting, for old tufts that have

grown freely and made considerable length of stem require to be split up and replanted in a rich soil once in every three years if their vigour is to be maintained. One of the things that has spoiled *H. sanguinea* as a thriving garden plant is neglect in cultivation, and this is shown by the vigorous growth of seedlings, which in their turn will dwindle if not well cultivated.

There is nothing so fatal to Heucheras as drought and an impoverished soil. The use of a good mulch of leaf-soil or similar material is to be recommended in hot dry seasons. The practice of associating these plants with alpine in rock gardens is in some measure responsible for the cultural neglect that has been their lot, and though some are well suited for this use their love for a rich soil and the need of ample space for development should not be overlooked. The colouring of Heucheras pertains mainly to the calyx, and its development is not maintained under glass or in shady places. Hybrid seedlings vary considerably, and the hybridist may expect to find 90 per cent. of bad colour forms amongst his seedlings, but if a good species is employed as the seed-bearing parent the percentage of good plants is reversed. Indeed, in carrying a hybrid race through the third and fourth generation for the development of a desirable feature, it appears necessary to use a species as seed parent every time. Seedlings of a reverse cross in which a hybrid bears the seeds all revert to an original type. Good Heucheras of easy growth are:—

H. brizoides (*hispida* × *sanguinea*).—A very strong plant, the leaves of which are bronzed-tinted, but not so fully coloured as in *hispida*. The stems are 3 feet high, and bear pink-tinted flowers that do not expand widely. The inflorescence is large, and it branches freely, but the flower colouring is somewhat dull, and this dullness is augmented by the presence of greyish down on the outer surfaces of the calyx. It is a splendid border plant, however, and it flowers twice each season, and the second display is brighter than the first.

Var. gracillima is a pretty hybrid between *miorantha* and *sanguinea*, with very small rich pink flowers, but freely borne on elegantly branched feathery stems 2½ feet high. The foliage resembles *H. miorantha*, and it is quite glabrous. One can recommend this neat little plant for the rock garden or border; the inflorescences look like a pink mist hovering over the plants when seen from a distance. The plant is misnamed, for there is no trace of *H. brizoides* in any of its characters, and its seedlings are pure *miorantha* and *sanguinea*.

H. Coralie is a hybrid seedling resulting from crossing both *brizoides* and *zabelana* with *sanguinea*. The habit is that of a vigorous *sanguinea*, with the coral tint seen in *brizoides* fully developed. The flowers are of large size and expand fully, and they look very dainty depending from the tall stems *Pentstemon* fashion. It is not yet available for general planting, but will be distributed in 1904.

H. Drummondii is a slender growing plant of *miorantha* type, with very small flowers of greyish pink colouring. It has a certain value in that its light habit is of use in hybridisation, but its garden value is limited.

H. Fantasia is a singular looking little plant, probably a hybrid between *Richardsoni* and *glabra*. The flowers are wholly green, but the charm is in the leafage, which is deeply lobed, ruddy bronze, and edged with pale green.

H. Flambeau is a brightly coloured Heuchera of hybrid origin, evidently resulting from a cross between *zabelana* and *sanguinea*. It is only fairly vigorous, growing 2 feet high as a maximum, but it flowers very freely. They open widely, are coloured a bright red, and they are closely massed on the spike as in *zabelana*. It is a pretty plant, and the nearest approach to a free-flowering Heuchera of *sanguinea* colouring so far obtained.

H. hispida (Pursh) = *H. Richardsoni* (Hort).—A North American species, but of no value as regards its flowers; the leaves form large tufts, and their reddish tints when young, and bronze tints when mature, are useful touches of colour associated with rockery plants, particularly as the

leaves are persistent, and remain in good character the whole year round.

H. Künfeldense is a white *Heuchera* found in quantity among hybrid seedlings, resulting from crossing *H. zabelana* with *H. brizoides*. It is a free and strong grower, with tall, pale green stems, very glossy leaves, widely expanding flowers of quite a pure white, and loosely arranged around the stem. The inflorescence is not so packed as in *zabelana*, but more nearly approaches *brizoides*. It is a much better plant than *Heuchera sanguinea alba*, a variety that has long been tolerated in gardens in the hope that it may prove of use as a parent.

H. Lucifer is a *brizoides* × *sanguinea* hybrid of exceptional vigour, growing 3 feet high. The leaves are exactly like those of *brizoides*, the flower-spikes are freely branched and produced, bearing coral-red flowers slightly smaller in size than *brizoides*. The growths are so numerous that the plants measure 4 feet through the inflorescence when two years old. As a border plant it is a great gain, and it flowers twice every season.

H. micrantha (widely known also as *H. erubescens*) is a free-growing plant with minute flowers; its leaves are slightly hairy but very strong, forming tufts above a foot through. The stems are 3 feet to 4 feet high, bearing thousands of greyish pink flowers, smaller than Wheat grains individually, but in the aggregate they form pretty pyramidal inflorescences of great use for cutting. They serve as material for lightening any arrangement of cut flowers. In the border it looks like a greyish mist of the *Gypsophila* type, and the flowers are not dissimilar.

Var. rosea is a selected seedling with ruddy purple leaves, coral-red stems, and flowers of similar size and shape to those of the type, but with a decided pale pink tint. A plant that is pretty in the mass and useful for associating with things of coarser growth.

H. Roseamunde is the hybrid recently figured in THE GARDEN, resulting from a cross between *H. micrantha rosea* and *H. sanguinea*, a similar cross to that yielding *H. gracillima*. This plant is very vigorous in growth, and bears many 4-foot stems branching to the base. The flowers are rose-pink, larger than in *gracillima*, but not so large as those of *sanguinea*. The inflorescences of one plant when fully developed are 4 feet through. It is doubtless the best hybrid *Heuchera* so far raised, the flowers being of appreciable size and the colouring of the best. Its greatest use is in border planting.

H. sanguinea.—An old garden favourite, but a puzzling plant to grow and flower well. According to trustworthy observers it grows 4 feet to 5 feet high in a wild state, covering large areas of ground with a thick mantle of its richly-coloured flowers, but it has steadily decreased in vigour year after year, and it is now but a ghost of the original. With careful cultivation it will still thrive, and where strong plants are grown or seedlings raised and selected it would hold its own with many border plants for brilliancy of colouring.

Var. alba has so-called white flowers on spikes 1 foot to 3 feet high, borne more freely than in *sanguinea*, but the external colouring is a greenish grey, a little pink developing with age.

Var. splendens is a greatly improved form with larger and darker coloured flowers, but it has quite as bad a constitution as that of the type.

Grandiflora robusta Edge variety and *Walker's variety* are all forms of unusual vigour, and well worth growing. Their colours are mainly of a paler shade, and their exceptional vigour is best maintained by good cultivation on the one hand and raising the plants from seeds at intervals of a few years on the other hand.

H. zabelana is one of the earlier hybrids, whose parentage appears to be *H. sanguinea* × *alba*, in that both plants occur freely among its seedlings. It makes a close tuft of medium-sized leaves, and produces many brown-tinted stems 2½ feet high, bearing compact spikes of pale rose-pink flowers as large as those of *sanguinea*. The colouring is soft and refined, and the flowers expand widely, but the plant lacks the grace of the *sanguinea-micrantha* hybrids. It is a valuable garden plant, however as it appears vigorous and easy to grow.

Other hybrids that I have tested are *Pluie de Fen*, *La Perle*, and *Grenade*, but they lack vigour and flower but sparsely, and are not likely to make such fine plants as the majority of those described.

GEO. B. MALLETT.

PROPAGATING TUFTED PANSIES FOR AUTUMN PLANTING.

No time should be lost in preparing stock for autumn planting, as much depends upon early work if good pieces are to be placed in their flowering quarters in early October next. From among the numerous plants in the beds and borders there are ideal tufts to be found for perpetuating the different sorts, and this is a good rule to observe if growers have not a quantity of stock plants in a spare corner of the garden. The old tufts should be cut back, at least coarse and elongated growths, as well as those which are more than a few inches in length. This cutting back of the plants promotes the growth of fresh shoots subsequently, and these latter are the best type of cutting that can be procured. If these old stock plants be mulched with some light and gritty soil at the time they are cut back, and the soil worked well into the crown of the tufts, the newer shoots will quickly form roots. The new shoots with their rootlets should be carefully broken out of the crown of the plants, and those that are too long for treatment of this kind should be removed with a sharp knife, taking care to see that the cuttings are detached of sufficient length for the purpose of propagation. A good length for a cutting is from 2½ inches to 3 inches, and all should be of somewhat recent development.

Stock prepared in the way just described is invariably healthy, and to begin with cuttings of this kind is a distinct gain. It is astonishing what a quantity of cuttings a few stock plants will produce in the course of a month or two. As soon as the first batch of stock has been removed, give the plants a thorough watering, following this a few hours later with liquid manure. The old tufts in a short time bristle with fresh and healthy growths. This is continued well into the late autumn or early winter, so that a large quantity of plants of any given sort may be raised within the space of a few months.

It may be more convenient in some instances, especially where only a limited quantity of each sort is required, to adopt the more simple way of dividing the old plants. To do this satisfactorily, however, the old tufts should be cut back as previously advised, and when the newer growths are a few inches in length lift the old tufts and divide them. Some varieties divide more easily than others, and if one type of the plant be preferred over another choose that of a creeping-like style of growth. Generally, when an old plant is lifted there is, in addition to the shoots above ground, a cluster of other younger growths, only partially developed, that quickly make tufts when divided up with the other fully developed shoots.

On the other hand, the older type of plant often has just one tap root, the plant forming a somewhat dense cluster of growths in its crown on the surface, and in consequence is quite unfit for division. Propagation by cuttings is the only method to follow with plants of this character, and unless the variety has some special interest it should be discarded in favour of those of a true tufted habit.

The old way of inserting the cuttings in frames is far less satisfactory than the more natural and hardy one here advocated. For this early propagation make up a cutting-bed of light and gritty soil, and bring this up a few inches above the ordinary garden level. Make the surface level and lightly firm with boards, and then thoroughly water it with clean water from a fine-rosed can. July and August are the months to select when planting out in October is expected. The shade from small shrubs or trees answers well for the position of a cutting-bed at this season.

Insert the cuttings about 2 inches apart in rows, which should be between 2 inches and 3 inches apart, according to the growth of the respective sorts. Plants from cuttings inserted in open beds

retain their vigour better than cuttings of the same sorts inserted in cold frames. The latter are often unsatisfactory and covered with red spider and other insect pests. On the other hand, the open air treatment produces plants of robust growth. Plants raised in cutting-beds in the open may be lifted with an excellent ball of roots and young growths when the planting out period comes round. For spring planting our cuttings are also inserted in the open and left without protection in winter. In this case, however, the cutting-bed is made up in the warmer corner of the garden, and it is astonishing what splendid plants are raised in this way.

Highgate, N.

D. B. CRANE.

THE HAMMOCK UNDER THE OAKS.

THE RAINY JUNE.

THIS month will always be known in the annals of Rose Brake as "The Rainy June." In twenty years no other June has given us such a superabundance of cold, wet weather. It has rained every day this month except two, and that is an unprecedented record. This is the last day of the month, and we hope that July will inaugurate a new régime.

It is disheartening to visit the bed of frail and fragile Shirley Poppies. They are quite prone. They all lie supine upon their sides, just as if they had been flattened by a gigantic smoothing-iron. The undermost are still bravely trying to flower their poor heads in the dirt. Until they were so beaten down we used to go out every morning after breakfast to enjoy the charming combination of light and delicate colouring that their blossoms presented. All shades and combinations of red, scarlet, maroon, crimson, rose, salmon, blush, flesh, and white are represented here, in exquisite contrasts, pencillings, and shadings; and, somehow, all contrive to present an harmonious whole. Some are large and some are tiny; some are single, others double and semi-double; all are beautiful. To say that they look as if they were cut out of tissue paper would be to compliment tissue paper too highly. No, they are the handicraft of fairy modistes, and are fashioned of fairy fabrics, satins, gauzes, and crêpes.

But just now we do not go to visit them with any pleasure, unless a feeling of admiration for their pluck in flowering at all under such adverse circumstances can be called a pleasure. We turn from them with a feeling of relief to the hundreds of stalks of tall Hollyhocks, which seem much better adapted to the endurance of hardness than the exquisite but delicate Shirley Poppies. The Hollyhocks still stand sturdily erect, their bloom little affected by the drenching rains. These are robust cottage maids, hardy and wholesome, and good to look upon.

Hollyhocks at Rose Brake have cross-fertilised themselves until their colourings are as bewildering as the combinations of a kaleidoscope. I know no other place where Hollyhocks live in such rampant, undisturbed freedom, nor where they seem more to enjoy themselves. All along the borders of the wild garden, and on the other side of the fence, which is the top of the orchard hill, they are undisputed queens of the land, increasing and multiplying at their pleasure. Originally there were planted here single, double, Alleghany hybrids, and the Fig-leaved Hollyhocks. Now, after several years of freedom, they have almost all reverted to one type, the single, but their colours partake of all the original kinds, and they have sought

out many new shades and variations. Some of the salmon-reds produced from the cross-fertilisation of the common red and the Fig-leaved species are very pretty. It has been reassuring to see them in the dripping rain, looking so cheerful and so hopeful of better things to come.

One of our nightly pleasures for some days has been to watch the great blossoms of the Evening Primrose expand to the silent summons of the night. The plant is over 5 feet in height, and has many branches. Sometimes fourteen blossoms open on the same evening, and there are many branches still to flower, so that from present appearances we can enjoy their opening for many nights to come. It is a novelty to us, for we have never before this summer had any plants of *Oenothera biennis* var. *lamarckiana* here, though we have tried various other kinds.

The little girl and I are usually at our post, sometimes under umbrellas, about half-past seven o'clock, to see the pretty flowers unroll.

bloomed for the first time here. This is a species that is indigenous to the States south of Virginia. It is a grand sight by moonlight, with its straight grey trunk, its long leaves that often measure 3 feet in length by 1 foot in breadth, and its marvellous flowers, whose diameter, when fully expanded, is often 1 foot across. The flower is at first vase-shaped, but gradually the petals fall apart. They exhale a rich perfume like that of some Orchids. The three outer petals are cream white, while each of the inner petals has a blotch of purple at the base that looks as if it were the impress of a large thumb that had been smeared with purple paint.

Many different varieties of the Marvel of Peru, which the cottagers call "Pretty-by-nights," are also planted along this path, with much Lavender, Lemon-balm, Thyme, and other aromatic herbs. A white Rose trained to a trellis here is just opening. It is the single-flowered *wichuraiana*, and is the last Rose to flower here, even later than *Rosa*

lower branches of our *Hydrangeas* rest upon the ground, and all the flower-heads turn towards the sun. They are planted in partial shade, close to the Oaks from which the hammock swings. Several kind of *Hypericums* are now in flower, and the *Catalpa* trees are just shedding their blossom. Many bush *Spiræas* complete the small list of shrubs in bloom at this time at Rose Brake.

It is worth while to make a new Rose garden if only for the pleasure of seeing one's new Roses flower for the first time. Such a garden was made here last fall, and almost every day now some new beauty greets us when we pay our morning call to the garden. It is a rather heterogeneous medley of Roses of many classes, all put to nurse in the new "Dutch Garden," as we call it, until they are large enough to be transferred to their permanent quarters. Many of them, though old enough, are new to us, and promise to endear themselves to us more and more on closer acquaintance. One little bed is given up to the

Polyantha hybrids, sometimes called Fairy Roses. Among the best of these that we have tried are *Etoile d'Or*, *Mlle. Cecile Brunner*, *Eliza Chatrand*, and *Little White Pet*. I do not know any other Roses that furnish such quantities of bloom the season through. They are true ever-bloomers. *Grüss an Teplitz* has given us a few pretty flowers of a distinct cherry red. Some catalogues describe this as a very fragrant Rose, but with us it has scarcely any fragrance at all, which is quite a disappointment. Fragrance is such a lovable quality in a Rose, or, indeed, in any flower, that it is like amiability in a friend.

This is the 1st of July, though this letter was begun yesterday, the last day of June. The change I hoped for has come. The sun is shining in an intensely blue sky, and, alas! it is very warm, and bids fair to be much warmer. All the birds are rejoicing over the cessation of the long rains. And what a variety of birds we have! Cat-birds are the most persistent singers to-day. I believe the cat-bird is a native American, and that England knows him not. Now I cannot imagine a garden without cat-birds, and I am led to wonder what English song-bird they most resemble. Or is there any bird in English gardens so impertinently and amusingly familiar; so

inquisitive; so at the same time shrewish and friendly as our cat-bird? No American song-bird, except the mocking-bird, has such a varied repertoire. Besides cat-birds there are many wrens, robins, red-birds, blue-birds, finches, warblers, thrushes, and orioles, all joining their voices in one full chorus to assert that life is good and worth the living.

DANSKE DANDRIDGE.

Rose Brake, West Virginia, U.S.A.

NOTES ON HARDY PLANTS

DELPHINIUMS AT MARGATE.

THE accompanying illustration represents two *Delphiniums* grown from seed in a small garden at Margate. They are both semi-double, the outer petals a brilliant azure blue, and the inner a rosy lilac, one having a dark and the other a bright centre. The plants are about 5 feet high.

Marlowes, Margate.

E. HOLT (Miss).

DELPHINIUMS IN A MARGATE GARDEN.

At first there is a slight relaxation of the folds of the petals, which are so neatly wrapped in the long green calyx; then a visible stir and swelling; the divisions of the calyx fall slowly back; the edges of the petals take the form of a St. Andrew's cross; an instant later they burst open, and the heart of the flower is revealed. Much slower is the process of unfolding in *Oenothera taraxacifolia*, which is of low trailing growth, with beautiful large white flowers, often tinged with pink. This species carpets the ground beneath the larger sort, and it takes close and somewhat tedious watching to see the blooms expand.

The winding path that leads to the Hammock under the Oaks, where we love to spend the evening hours, is bordered with these Evening Primroses, and with many other flowers that are at their best under the soft spell of moonlight. Here it runs beside the Yucca bank, where the great flower-stalks look like shrouded forms of mystery, fit guardians of the secrets of the night. A little further on the large-leaved *Magnolia*, *M. macrophylla*, has just

setigera, which is now at its best, sprawling over a small red Cedar, while *R. wichuraiana* is only beginning to bloom.

A rough bank of red clay along one of the drives through the Oak grove has always been an eyesore here, and we are now planting it with *wichuraiana* hybrids, such as *Evergreen Gem*, *Pink Roamer*, *Manda's Triumph*, *Gardenia*, and *Jersey Beauty*. All these are growing well, but will not bloom, I think, until next year. They were planted last fall. Another part of the same bank is planted with *Forsythia suspensa*, which makes a beautiful covering for banks.

Few shrubs bloom in July. Towards the end of the month many *Hibiscus syriacus* will take the place of the Hollyhocks, but these are not yet in flower. The handsome Oak-leaved *Hydrangeas* are very useful at this time, as they flower in June and continue long in bloom. The great, dark green, downy, five-lobed leaves, and large clusters of creamy flowers in an oblong panicle, make a clump of this *Hydrangea* a beautiful object throughout the summer. The

IN A GLOUCESTERSHIRE WILD GARDEN.

IN A GLOUCESTER WILD GARDEN.

THE illustration shows a peep in the garden of Mr. Hiatt Baker, Oaklands, Almondsbury, Gloucester. The flowers so charmingly placed are Irises, Moon Daisies, Shirley Poppies, and Valerian, but other things are grown too, though these are the chief features. The flowers are grouped or scattered here and there, and a few weeks ago when in full beauty made a picture of much interest. Mr. Baker kindly sent the photograph.

THE PACHISTIMAS.

ACCORDING to the "Index Kewensis" the genus *Pachistima*, belonging to the natural order *Celastrineae*, consists of only two species—*Canbyi* and *Myrsinites*. The latter of these was formerly called *Myginda myrtifolia*, but it is not so ornamental as *P. Canbyi*, and, moreover, is hardly procurable from ordinary sources, so that *P. Canbyi* is the only one of which much may be said at present. It may suffice, therefore, to say that *P. Myrsinites* is a small shrub of evergreen habit with greenish flowers, growing from 1 foot to 2 feet high, and succeeding in almost any soil where it is not too dry in summer. It comes from the North-West American Mountains, and is fairly common in some parts of the Rockies. As a garden plant it is quite surpassed by its congener *P. Canbyi*, whose popular name of Canby's Mountain Lover is, apart from the appropriative word of "Canby's," attractive enough. *P. Canbyi* is a very pleasing little shrub for the rock garden, where, if not showy, it is always attractive with its small evergreen shiny leaves on what an American writer describes as "corky" little branches. The flowers are exceedingly small and are reddish in colour, but are not so conspicuous as to be of much attraction in themselves. Combined, however, with the foliage and the general character of the plant they make a charming feature of the spot in the rock garden occupied by the *Pachistima*. The whole plant is more frequently 6 inches than 12 inches high. It is said to grow on dry exposed rocks in the mountains of Virginia and West Virginia, but from what I have seen of it here I am of opinion that it likes a fair amount of moisture at the root. Though it is not very fastidious in the matter of soil, a moist peat seems the best for its welfare. When in full bloom *P. Canbyi* is very pretty. I have here adopted the spelling of the name *Pachistima* as given in the "Index Kewensis," but

the plant is more commonly known as *Pachystima*, the spelling preferred by the authors of the "Illustrated Flora of the Northern United States and Canada."

Carselhorn, by Dumfries, N.B. S. ARNOTT.

ARCTOTIS GRANDIS.

THIS South African annual, which has only recently been introduced, is proving a great acquisition in a Sussex garden. In a fairly sheltered and sunny exposure single plants have become sturdy, many-branched bushes, 2 feet or more in height, each branchlet bearing many large flower-heads well supported on long stems. The ray florets with their yellow base, which are pure white on their inner surface, have a peculiar satiny sheen, and contrast admirably with the bright lavender-blue disc—a colour not frequent in the centres of composite flowers. The main stem requires to be firmly staked, but the ties, if well managed, are not noticeable. The copious rains which have fallen of late in the district have certainly done the plants no harm, so vigorous are they and full of bloom, with every appearance of going on steadily until frost cuts short their career. It is pleasant every morning to see the glistening flowers holding up their heads to greet the sunshine. They open best, it is true, in bright weather, but for some reason—possibly hygro-metric—do not always remain shut even on a grey cloudy day. The closed flowers, however, then show the pale blue outer side of the petals and are in themselves ornamental. The flowers are good for cutting as they grow singly on stalks 6 inches or 8 inches long, and remain open in water the greater part of the day, closing towards evening after the manner of the Daisy tribe and opening again with daylight. They should be cut on first expanding. A very pretty illustration of this fine plant appeared in THE GARDEN on September 21, 1901, but its decided merit has not yet been very generally recognised. It is easily raised from seed, requiring no heat whatever, but if sown early, which is desirable, the seedlings must be pricked off singly into small pots and kept under glass in a cold frame or greenhouse until they are strong enough to be transferred to the open border. Is it an established fact that *A. grandis* is only of annual duration? The character of the plant seems to suggest that it might be perennial under suitable conditions. In any case it fortunately lends itself

without any difficulty to the treatment of half-hardy annuals in general. K. L. D.

NEW DOUBLE DAFFODILS.

I AM rather at a loss to understand why these new double varieties raised by Mr. Engleheart have not found favour with the majority of the members of the Narcissus committee. Although they have been exhibited by the raiser on many occasions they have so far always been passed over, with the result that not half as much notice has been taken of them as their beauty really warrants. Of the three varieties, all of which were obtained from a cross between the old double yellow trumpet and poeticus ornatus, I much prefer Argent, the variety illustrated; and when I say that it has found considerable favour with such good judges as Miss Currey, the Rev. W. Wilks, and many others, and that good bulbs of it may now be purchased for a few shillings apiece, it will be rather surprising if it does not become a most popular flower in the near future. In reality Argent is a semi-double flower, with two or three sets of pure white pointed segments. The divisions of the cup are bright yellow; in most of the flowers the cup is double, in others (as can be seen in the top flower in the illustration) the cup is practically single.

Dubloon is quite distinct from the first-named, though of very much the same type. It is more double, and possesses four to five sets of rich yellow segments and an orange centre.

Plenipo, the third variety, is also perfectly distinct from either of the two preceding ones, and I consider it an acquisition. This also has four to five sets of creamy-yellow segments and an orange centre. But the most important point about these flowers is that they possess tall rigid stems and stand bolt upright. Alas! how many of us know to our cost what great havoc is wrought to our flowers by a gale. Always the first to go are those old favourites known as "Butter and Eggs," "Eggs and Bacon," and "Codlins and Cream." These new doubles, with their sturdy stems, stand being knocked about by those April squalls to which we Daffodil growers are well accustomed. The bunch of Argent, from which the illustration was prepared, was exhibited by Mr. Engleheart at Birmingham on April 16 last, and the best compliment that anyone can pay Mr. Engleheart is to grow his exquisite varieties as well as he himself grows them.

Worcestershire.

ARTHUR R. GOODWIN.

TREES & SHRUBS IN ALDENHAM HOUSE GARDENS.

SHOOTS of the following trees and shrubs were shown at the Holland House show on June 25. Owing to the large number of enquiries for a list of the specimens exhibited at the above show, I append a list of most of the noteworthy.

<i>Acer campestre pendulum</i>	<i>Acer Pseudo-platanus Worleyi</i>
<i>foliis maculatum</i>	<i>" Pseudo-platanus Simon Louis Freres</i>
<i>" carpinifolium</i>	<i>" colchicum rubrum</i>
<i>" diabolicum</i>	<i>Allanthus glandulosa</i>
<i>" japonicum filicifolium</i>	<i>" pendula</i>
<i>" aureum</i>	<i>" flavescens</i>
<i>" palmatum roseo marginatum</i>	<i>Æsculus Hippocastanum aureo-marginatum</i>
<i>" palmatum septemlobum</i>	<i>" Hippocastanum laciniatum</i>
<i>" elegans atropurpureum</i>	<i>" Hippocastanum aureum</i>
<i>" fraxinifolium albo variegatum</i>	<i>" flava</i>
<i>" fraxinifolium aureo-variegatum</i>	<i>Alnus glutinosa foliis aureis</i>
<i>" fraxinifolium crispum</i>	<i>" laciniata im-perialis</i>
<i>" californicum aureum</i>	<i>" rubrinervis</i>
<i>" saccharinum</i>	<i>" incana monstrosa</i>
<i>" Ginnala</i>	<i>" laciniata</i>
<i>" dasycarpum</i>	<i>Aristotelia Macqui</i>
<i>" pyramidale</i>	<i>Amorpha fruticosa</i>
<i>" platanoides albo-variegatum</i>	<i>Amygdalus dulcis purpurea</i>
<i>" platanoides globosum</i>	<i>" orientalis</i>
<i>" laciniatum</i>	<i>Aralia Maximowiczii</i>
<i>" " Schwedleri</i>	<i>" pentaphylla</i>
<i>" " Reitenbachii</i>	<i>Amphiraphis albescent</i>
<i>" Pseudo-platanus Leopoldi</i>	<i>Acanthopanax aculeatum</i>
<i>" Pseudo-platanus purpurea Nisetti</i>	<i>" spinosa foliis-albo-marginatis</i>
<i>" Pseudo-platanus Prince Handjeij</i>	<i>Betula alba purpurea</i>
	<i>" laciniata pendula</i>

HAMPTON COURT PALACE GARDENS.

VISITING the above gardens a few days ago I was pleased to notice the introduction of the new hybrid Water Lilies. They are planted in the basins of the ornamental fountains in the east and south gardens. Those in the east gardens were looking very beautiful on the morning of my visit, most of the best varieties being represented, and to me they appeared one of the most interesting features of the garden on that day.

I have not visited the old-fashioned and delightful south garden of the palace for some years, and was delighted to find a great improvement in its planting and up-keep, and this brought about without disturbing its old-world character and associations. This garden is full of interest at all seasons with its wonderful old Yews and its ancient royal bower, but most of all late in spring or early summer, when the rich collection of hardy flowering trees and shrubs are in bloom. Standing on the extreme end of the terrace near the lawn tennis ground and looking towards the palace, I do not know of a garden scene invested with a richer, more varied, or a more pleasing and restful aspect than this. On the left is the River Thames, on the right the east garden, with its immense expanse of lawn, its interesting avenues of old Yews, its beds and borders of bright flowers, and its boundary of giant Elms, keeping watch as it were over the whole. But the south garden at the season mentioned to my mind is the gem of the whole garden, with the splendid south façade of the palace as a background, the immense mounds of Lilac, Weigelas, Thorns, Laburnums, and other hardy trees in flower at this season (late spring), with the endless variety of spring flowers margining the whole groups, compose, as I said before, a garden scene of rare interest and beauty.

There is one innovation in this garden which I regret to see, namely, a portion of one of the quarters devoted to what appears to be an attempt at forming a wild garden. A wild garden is all very well in its place, but to be consistent it should be placed in such a position as is naturally more or less wild like itself. In that part of the garden called the wilderness, for instance, it would have been quite appropriate. I respectfully submit it is out of place in this delightful old-world garden.

CHRYSANTHEMUMS.

EARLY-FLOWERING CHRYSAN- THEMUMS.

SEASONABLE WORK.

IN the plants in the open border the past month has wrought a great change, and there is now the promise of an unusually brilliant display in the near future. The early-flowering Chrysanthemum quickly responds to kindly treatment, and soon gets established. For some time past our plants have had the support of stout stakes, and it is just as well that this was done rather earlier than usual this season. They have for rather more than a week needed a second tying, and where this has been neglected many useful lateral shoots have, by their own weight, broken out from the main stem, and the symmetry of the plant in a degree destroyed.

Curiously, this breaking out of the shoots is chiefly met with in plants of *Mme. Marie Masse* and its sports, a type of the early-flowering Chrysanthemum that is generally considered as ideal. This is a common failing with Chrysanthemums which are given a pinching or stopping of the main growths earlier in the season. Interference with natural development by pinching or stopping has the effect of producing shoots less tenacious in their hold on the main stem, and these in boisterous weather not infrequently break out most inconveniently. For this reason I have

THE NEW NARCISQUS INCOMPARABILIS ARGENT. (Much reduced.)

always deprecated the pinching or stopping of the early-flowering Chrysanthemums. The only reason that one can suggest for this slight failing with some of the early sorts is the quick growth which these plants invariably make. The wood cannot mature or ripen sufficiently quick to strengthen and support their own weight, and the branching lateral shoots get broken off at their union with the main stem. This work should begin immediately the lateral growths are a few inches long, and if the plants be in rows, as ours are, protection may be easily provided. Insert other stakes alternately between those already supporting the plants, and midway between one plant and another. Begin at one end of the row with

a good stout stake, as the strain will be greater there than at any other point. Either raffia or tarred twine may be used, and this should be looped from one stake to another, so as to embrace the numerous lateral shoots of the respective plants, thus maintaining them in an upright position. It is better at this season to make one tie rather low down, so as to embrace the lower growths, and then at a later period—say two or three weeks hence—give another similar tie, but in this instance bringing the loop just below the last break. The tarred twine or raffia, of course, is carried down on both sides of the rows of plants, and when this is properly done the strong winds of autumn seldom give one much cause for anxiety.

In the case of large individual plants in the borders and elsewhere it is better to first tie the main stem two or three times to reliable stakes, and when the lateral growths attain respectable dimensions to insert two or three smaller Hazel stakes or Bamboo canes about 1 foot or rather more from the one in the centre. Then run the tying material round this twice, once at the present time, and again a few weeks later. Now that buds are developing at the apex of many of the shoots the surface soil should be dressed with a good concentrated manure. Ichthemio Guano has never failed in our case, providing as it does just the plant food that these autumn flowers appreciate. A liberal dusting of this guano round about the plants on the surface soil should be applied and subsequently hoed in. As a result of this generous treatment an impetus is given to the growth of the plants, and the satisfactory development of the buds is thereby ensured. There is a tendency with some growers, more especially in the case of those who have grown the November sorts for exhibition, to disbud their plants rather severely. No greater mistake could be made. The early-flowering Chrysanthemums do not take kindly to this treatment. As a matter of fact, they are never seen to greater advantage than when grown quite naturally. Disbudded blooms seem to lose the beauty and charm that those produced on freely-flowered sprays possess, and it is only necessary to compare the two varieties to be convinced of this. The late Mr. W. Piercy, one of the pioneers of these flowers, was always very strong on this point, and the wisdom of his methods cannot be gainsaid.

Highgate, N.

D. B. CRANE.

AN ARTIST'S NOTE-BOOK.

GLADIOLUS ELLINGTON BELLE.

THE Gladiolus season was ushered in recently by a new variety of much beauty, which gained an award of merit from the Royal Horticultural Society; it is called Ellington Belle. The large shapely flowers are cream colour, with a trace of scarlet at the tips of the segments, and produced thickly on a strong spike. One of its chief charms is its delicacy of colouring.

SOME NEW ROSES AT THE ABBEY PARK SHOW, LEICESTER.

MESSRS. A. DICKSON AND SONS, Newtownards, Belfast, were very successful exhibitors of Roses at the above exhibition on the 4th inst., not only taking the first prize in every class in which they competed, but also exhibiting several new Roses of great interest; among them

George Dickson (H.T.), which might be popularly described as a glorified Liberty, in colour bright glowing crimson, overlaid with a slight dark shading, of the largest size, full, and with large, stout, finely-formed shell petals; it was said to be the second bloom cut from the seedling, and should it maintain the fine character seen at Leicester it

THE NEW GLADIOLUS ELLINGTON
BELLE.

Three-fourths natural size.)

(Given an award of merit, Royal Horticultural Society, on August 4, and shown by Mr. W. C. Bull, Ellington Road, Ramsgate.)

cannot fail to be regarded as a great acquisition. It was selected as the best bloom in the show.

Countess of Derby (Tea).—Creamy white, with a delicate pinkish salmon centre. Very pleasing.

George Prince (H.T.).—A flower of the build of Mrs. E. Mawley, but with more primrose in the ground colour, and with a deeper tint on the petal edges; of full substance.

Mrs. Pierpont Morgan (Tea).—Deep rose with a flush of violet, a flower of the build of Mme. Cusin, but deeper in colour.

Charles Grahame (H.P.).—A brilliant deep scarlet Rose of excellent build, and quite glowing in colour.

Duchess of Westminster (H.T.).—A variety with something of the character of *La France*, and recurving as that Rose does on the centre petals; the surface cream, the reverse delicate pink. A very promising Rose.

H. V. Machin (H.P.).—Bright crimson, flushed with purple and maroon; a fine full flower.

Mention may be made of *Florence Pemberton* (H.T.) as being in very fine character; and *Oskar Cordel* (H.P.) was very fine, bright rose in colour, with large, finely formed petals; bold and striking. R. D.

TREES AND SHRUBS

CORNUS CAPITATA.

(*BENTHAMIA FRAGIFERA*.)

FROM Nepal in 1825 this handsome flowering tree was introduced, when seeds were sent to Mr. John Tremayne of Heligan, Cornwall. The plants raised were at first placed in the greenhouse, but, becoming too large for their quarters, were planted in the open. After about twelve years' growth they commenced to flower and fruit, and since that time numberless seedlings have been raised in Cornwall and elsewhere. In 1838 the plant was awarded a silver medal by the Royal Horticultural Society, and was named *Benthamia*, after the secretary to the society at that time. Of late years the title has, however, been changed, and the appellation of *Cornus capitata* substituted, but the tree is still invariably known to those who grow it by its earlier name. In Cornwall it is largely found in shrubberies and woods, and presents a lovely sight in July when covered with its large, pale sulphur flowers, which are about 3 inches in diameter, and give the trees the appearance of clouds of faint yellow, while the effect by moonlight is particularly charming. The true flowers of the *Benthamia* are inconspicuous, the large, yellow, petal-like segments that appear to form the flower being really bracts.

The tree is usually considered tender, but at Fota in County Cork it has withstood 25° of frost with but little injury, while another correspondent has recorded it as enduring 26° with no further damage than the browning of the tips of the leaves. On page 26, volume lxii., of *THE GARDEN*, "R. P. B.," in an article whose value is almost entirely nullified by the neglect to specify locality, records *Benthamia* thirty years of age in Scotland, but presumably this refers to an exceptionally mild spot.

The subject of this note is seen at its best when grown in a sheltered but fairly open position, backed by deciduous trees, whose fresh green constitutes an admirable background for the masses of creamy yellow blossoms. When afforded ample space the *Benthamia* forms a spreading tree with branches sweeping the ground, one at Fota measuring 27 feet in height in 1884 and having a branch circumference of 120 feet. There is a fine specimen on the lawn at Enys, and in Mr. Jonathan Rashleigh's lovely garden at Menabilly, Cornwall,

where the photograph here reproduced was taken, there are a number of large examples. I understand that the tallest specimens are at Heligan, where the tree was first introduced, and that these exceed 50 feet in height and have a trunk diameter of 5 feet. I have seen many good trees of this species in Devonshire gardens, and have also met with it in the South of Ireland, the Channel Islands, Dorsetshire, and Hampshire. It seems indifferent to soil, and I have found it doing well in shallow clay. It sheds its leaves in January and February, but is never completely bare. In the autumn it enters upon a second season of beauty and justifies the name of Strawberry Tree, which it shares with *Arbutus Unedo*, for towards the end of October the fruits begin to ripen, becoming a deep crimson in colour and often being borne in such quantity as to bend the branches downwards with their weight. Large fruits measure 4 inches to 5 inches in circumference. While the berries are on the tree the future flowers may be seen, the size of Peas, studding the new shoots. The fruit often hangs till after

ripe. The pod is very small and round, and is best sown with the seed, which readily germinates.

Bagshot, Surrey.

J. CLARK.

USES OF BRITISH PLANTS

(Continued from page 98.)

IX.—UMBELLIFERÆ.

CELERY (*Apium graveolens*).—This is a common ditch plant near the sea, but not infrequently inland as well. It is unwholesome when green, if not really poisonous. By earthing up the deleterious property is not developed. In Malta it is never blanched, but used for flavouring only. The Turnip-rooted variety, known as "*Celeriac*," is much used on the Continent. It is an Italian name; the old English terms were "*ache*" and "*Smallage*." It was much used in drugs in the Middle Ages for gout, fevers, &c.

Caraway (*Carum Carui*).—A naturalised plant, having escaped from cultivation. It is one of the group of umbellifers characterised by having car-

CORNUS CAPITATA (*BENTHAMIA FRAGIFERA*) IN FLOWER IN MR. JONATHAN RASHLEIGH'S GARDEN AT MENABILLY, CORNWALL.

Christmas, but in some places and seasons the birds devour it eagerly, and thereby spoil the pretty effect of the trees with branches drooping beneath the weight of their glowing load of berries.

S. W. FITZHERBERT.

HEDYSARUM MULTIJUGUM.

THIS is a native of the southern parts of Mongolia, and is a distinct and very pretty member of the hardy Leguminosæ. It makes a small shrub 3 feet to 4 feet in height, with slender much-divided branches of a greenish white hue, as also is the whole plant. The leaves are 3 inches or so long, pinnate, with small, entire, oval leaflets, the whole having a tender, Fern-like appearance. The Pea-shaped flowers appear in short, upright racemes, are bright purple, and very freely produced all over the plant. With age it tends to get loose and leggy, but can be remedied by pegging the longer branches down round the plant, when they will grow and flower as before. It seems practically indifferent as to soil, but a light sandy one is best for flowering. The seed is found singly or in pairs in the dead flowers, which hang on the plant until

minative properties, like Cumin, Dill, and Anise, but is grown for flavouring purposes. The scattering seeds over cakes has long been practised. Cumin is now used for so doing in Southern Europe, and the black seeds of "*Fitches*" (*Nigella*) were so employed by the ancients. The name was derived from Caria, whence, Pliny says, the plant was received. The roots are also edible, like Parsnips, while the foliage might be used as salad, or instead of Spinach.

Parsley (*Carum Petroselinum*).—This is regarded by Hooker as an escape, as it is not found wild. It was known to the ancients, and was certainly cultivated here in the fifteenth century, and probably before. Gerard calls it "*Parsee*," describing it as "delightfull to the taste and agreeable to the stomache; while the roots or seeds boiled in ale cast forth strong venome or poyson." Chaucer calls it "*Persly*." It was much used for medicine in the sixteenth century.

Gout-weed (*Egopodium Podagraria*) is a much-creeping herb found near buildings, and supposed to have been introduced and cultivated in the Middle Ages. It was also called Herb Gerard and Bishop's-weed in the sixteenth century. Though

many remedies are given for gout in the fourteenth this plant is not mentioned. The name *Podagraria*, Gerard says, was given by Germans. The young leaves are said to be eaten as a green vegetable in Sweden and Switzerland.

Cicely (*Myrrhis odorata*).—This occurs in pastures, &c., usually near houses, as it was formerly much cultivated as a pot herb, eaten either as a salad or boiled, and is still so used in Germany. It is very aromatic and carminative and stimulant. It was called Great Chervill or Myrrhe in Gerard's time.

Chervil (*Anthriscus Cerefolium*).—This is a rare plant and only occurs as an escape from cultivation or introduced with other seed. It was formerly grown as a pot-herb and for salads. Turner, writing in the sixteenth century, says: "If it be eaten in a sallat, it is good for the stomache and the head, by reason of the pleasant smell that it hath." It was called *Cerfoile*, *Sistrum*, and *Sisaron* in the fourteenth century.

Fennel (*Foeniculum officinale*).—This is probably native as a maritime plant, as at Barmouth and the Channel Isles. It was used in former days with St. John's-wort to be suspended over doors at midsummer against evil spirits, &c. It is carminative and aromatic, like many other umbellifers, the oil of fennel distilled from it being chiefly employed. It was used in a variety of ways as a drug in the fourteenth century.

Coriander (*Coriandrum sativum*), only found in waste places, as an escape from cultivation, as it has long been cultivated in South Europe, and introduced into England. It will be remembered that Manna was described as being round like Coriander seed, the fruits of this plant being exceptional in that respect. The name is from the old Greek term, *korrin*, a bug, from its peculiar odour, which disappears when the fruit is dried. Like Caraway, the fruits (miscalled seeds) are used for flavouring bread and confectionery, and for curry powder. It is recommended in a receipt of the fourteenth century for "reed pynpyl that warit on the face," i.e., a red pimple that annoys.

Samphire (*Crithmum maritimum*).—This has fleshy succulent leaves, due to the presence of salt, as it grows on maritime rocks. The name is a corruption of *San Pietro*, as it is called in Italy, the Herb of St. Peter. Gerard described it as furnishing "the pleasantest sauce, and best agreeing with man's body, for the digestion of meats, &c." Cattle are fond of the foliage.

Lovage (*Ligusticum scoticum*).—This is found on rocky coasts of Scotland. The foliage is used as a green vegetable, raw or cooked. An infusion is used as a remedy for cattle, being aromatic and carminative. Another, a European species (*L. officinale*) is the Lovage of the garden, and much used as a drug plant in the fourteenth century.

Angelica (*A. Archangelica*) is a garden relic. It has a very large and fleshy root, both pungent and aromatic. It is the leaf and stalks that are eaten when candied with sugar by the confectioner. The name was apparently given to the plant from its supposed virtues in expelling the plague. The true British species, *A. sylvestris*, is inferior to it.

Master-wort (*Peucedanum Ostruthium*).—This is a rare plant and naturalised, having been formerly cultivated as a pot herb and used in medicine in the Middle Ages. The name is due to its supposed "commanding" virtues over the ills that man is subject to. It is called "Masterwort or False Pellitory of Spain" by Gerard, who thus described its virtue: "It is not only good against all poison, but also singular against all corrupt and naughty aire and infection of the pestilence, if it be drunken with wine." He also adds a number of other uses.

Wild Parsnip (*Peucedanum (Pastinaca) sativum*).—This is the origin of the garden Parsnip. The Student, "the best in the trade," was raised from it by Professor James Buckman at the botanic gardens of the Royal Agricultural College, Cirencester, from 1847—1851, when Messrs. Sutton and Sons issued it. The Parsnip was known to the Romans, who collected the wild plants and improved the roots by growing them in a rich soil. In the Channel Islands a large variety is grown for cattle. It is said that in Ireland Parsnips were

mashed up and fermented for a kind of beer. It has also been used as a drink instead of coffee. The seeds are aromatic and formerly used as a drug.

Carrot (*Daucus Carota*).—The wild Carrot is extremely common; when ripening the umbels close up, forming so-called "birds' nests" in the country. It is the origin of the garden vegetable. The long and short forms (like those of Radishes) originated by being grown in a loose and stiff soil respectively, but are now hereditary, as after careful selection they come true by seed. A spirit has been distilled from Carrots on the Continent, as it contains an abundance of sugar, which is readily converted into alcohol.

GEORGE HENSLAW.

GARDENING OF THE WEEK.

THE FRUIT GARDEN.

HARDY FRUITS.

STOP all strong growths on Peaches and Nectarines, and keep the shoots neatly trained in to let in light and air. The heavy rains we had last month thoroughly soaked the borders; the trees are healthy, vigorous, and free from insects, and promise to ripen up a crop of fine fruit, but owing to the lateness of the season Walburton, Late Admirable, Barrington, and other late sorts will need timely attention to every point to get the fruit forward and the wood perfectly ripened before bad weather sets in. To this end early afternoon syringing with water at a temperature of 80° will do good service, and an occasional surface watering with tepid water will add to the size and improve the quality of the fruit. Complete the thinning of fruit on walls and stop all lateral growths, as every ray of sun and light will be needed, and even then many of the choice sorts will be found deficient in flavour. Cut away the old canes as soon as Raspberries have done bearing, and thin out all the weakest shoots of the current year to let in light and air. Tie up those left to prevent them from being injured by the wind, and keep the beds free from weeds.

VINES.

Early houses in which the wood is getting ripe may now be freely ventilated by night and by day, and more mulching may be spread over the inside borders to keep the roots moist and active. Syringe well every evening to preserve the foliage as long as possible, and while shortening back all strong laterals to strengthen and plump up the fruit-bearing buds, allow weaker growths to have full play until the main leaves begin to ripen. If any of the Grapes have not finished well, the roots should be lifted and relaid in fresh soil, or a portion of the old compost may be taken away and replaced with rich loam before this month is out. The mode of procedure having so often been described in these columns, it is only necessary to advise despatch in the operation.

MID-SEASON HOUSES.

With every prospect of a change to brighter and better weather, it may be well to remark that black Grapes now ripe will keep best where the foliage is dense, but lacking this somewhat shading may be thrown over the roof until the fruit is out. On the other hand, white varieties colour and keep well, and Muscats take on the finest amber where sun, heat, and light can play freely through the foliage on and around the bunches. Should our hopes of brighter days be realised, fire-heat will only be needed to prevent moisture from condensing on the berries, and to admit of a free circulation of dry, warm air through the night. Keep the foliage clean by putting in a syringe of clean, soft water whenever it can be applied without damage to the fruit. Damp the floors well on fine days, and see that the inside roots are kept moist by the application of warm water whenever needful. Muscats and late Grapes now colouring will stand a high day temperature with plenty of air and sufficient moisture to keep the foliage fresh and healthy. If the main foliage in the Muscat house is clean and good the laterals may be well

shortened back to let sun-heat and light into the wood and fruit; but Lady Downe's and other black sorts will colour under a thick canopy of foliage provided the primary leaves are not crowded or injured by an unreasonable quantity of lateral growth. When colouring becomes general another heavy watering with warm liquid will greatly benefit the Vines by producing conditions unfavourable to spider, while its stimulating effects will result in a depth of colour and bloom which the fruit on half-starved Vines never possesses.

W. CRUMP.

KITCHEN GARDEN.

LETTUCE.

THIS is a good time to sow a large breadth for standing the winter, to be transplanted in early spring. The ground should not be too rich for this sowing or the growth made will be sappy and unable to withstand the winter. This is an important crop, and a piece of ground should be selected on a warm and sheltered border having a south or south-west aspect. Dig the ground and tread firm, afterwards raking to a fine tilth and level to receive the seed, which should be sown broadcast. By covering with a mat for a few days the seed will germinate quickly and the birds will be prevented from disturbing the soil, as they often do when the surface is dry. When the seedlings are large enough thin out the weakest to allow the remaining plants to stand clear of each other so that they may develop properly and become well hardened before winter. Of Cos varieties the old black-seeded Bath is unsurpassed for hardiness, and Hick's Hardy White is excellent if not exposed to exceptionally severe weather. Stanstead Park is one of the best of the Cabbage type; it stands the winter well, and turns in very early in the spring. Continue to put out on rich ground strong plants of the summer varieties for lifting and bedding in pits and frames for a late autumn supply.

VEGETABLE MARROWS.

The season has not been a good one for this delicate vegetable, and those who depended entirely upon plants raised under glass, and planted out in the orthodox way in June, will not obtain heavy crops, at any rate not until late in the year, when there is danger of the plants being cut down by frosts. It is in such seasons as this and 1902 that the good results accruing to the system of planting very early on hot-beds, and gradually hardening them off, finally removing the frames altogether, are fully demonstrated. So excellent is this plan that I shall not again depend upon the open air method of growing this invaluable crop. By adding fresh soil to the plants as growth proceeds, and layering the young shoots into it, the vigour of the plants is maintained, and an abundance of Marrows may be had until quite late in the autumn.

ONIONS.

The large specimen bulbs are now swelling fast, and there is promise of some clean and heavy produce. Some employers are very partial to these large and quickly-grown Onions, which partake of the flavour and mildness of the Spanish sorts of the shops. Provided they are well grown they keep well and firm for several months. The main crop is very backward this year, like most other root crops. At the time of writing the bulbs are not more than half grown, and the tops are showing no signs of ripening, as they usually do about this date. Should mildew attack the tops whilst growth is still active, they should be dusted with flowers of sulphur or soot in the early morning when the dew is upon them. A weekly application of liquid manure or guano will now assist the bulbs materially if not ripening off.

Stonleigh Abbey Gardens.

H. T. MARTIN.

FLOWER GARDEN.

LAWNS, WALKS, AND BORDERS.

THESE should now be kept in good order. Hedges should all be clipped, bearing in mind that the narrower these are kept at the top the less naked they will be at the bottom. Clip Box edgings, choosing dull or cloudy weather for the operation.

Cut in Laurels and other shrubs that are overgrowing adjoining plants. Cut out decaying stalks of herbaceous plants from among the fresh foliage at the bottom, remembering that the latter should not be shorn off at the same time, as is sometimes done. Continue to tie up plants requiring support, and train creepers. Roses on walls should be nailed in. Rock plants will need attention; many of them will require to be kept from overrunning their proper bounds. Seeds of choice flowers should be gathered as they ripen.

TROPEZOLUM SPECIOSUM.

Young plants should now have their shoots carefully guarded from slugs and field mice. The latter are most destructive, often cutting through growths yards in length. This Flame Flower is worthy of much attention and perseverance in establishing it. The after-treatment is simple in the extreme and the reward great.

SUMMER CHRYSANTHEMUMS.

These had a hard time of it in the early part of the season, but are now doing well and will need attention in the way of staking, as the stems are liable to be broken by high winds. Select stakes of a size to suit the height of the individual plants, and simply loop the larger of the branching shoots to them. Staking and tying the growths are important items in their culture, and the plants should be well in hand before the strong winds cause havoc among the growths.

BIENNIALS

are plants of two years' duration, the seed being sown the first year, and the flowering, seed-bearing, and death occurring the next. Many of them, however, may be continued for a longer period if prevented from seeding. Many of these ripen their seed in August or September, and should be sown immediately. Those that do not ripen till a later period may be kept till the April or May following. Double varieties of biennials can only be continued by cuttings.

CANTERBURY BELLS

may now be planted direct from the seed-bed to the places where they are to flower. These come in very useful for filling gaps occasioned by the passing out of flower of early annuals. Foxgloves should also be pricked out on good soil in beds where they will make good plants before being finally planted out in the autumn. The Hollyhock (although not a true biennial), if raised from seed, should now be ready for pricking off into well-drained boxes filled with a mixture of loam and leaf-mould.

T. B. FIELD.

Ashwellthorpe Hall Gardens, Norwich.

INDOOR GARDEN.

FREESIAS.

THESE lovely and useful bulbs are to be found in almost every garden, and as they have now enjoyed a long period of rest, where a large stock is grown, shake the old bulbs out of the soil and select them into three sizes. The largest should be used for extra sized pots of 7 inches diameter. Twelve to fourteen bulbs in a pot of this size should make a fine object for a vase for the drawing-room. The next sized bulb should be planted eight or ten bulbs in a 5-inch or 6-inch pot. The small sized bulbs are best planted in shallow boxes, 2 inches apart, with the primary object of producing strong bulbs for another year, and in this case the flowers should be cut as soon as they are open. Freesias like light rich porous soil, about two-thirds light loam and one-third leaf-soil, with sufficient sand to keep the whole open; a little Clay's Fertilizer may be incorporated with it. Make the soil rather firm in the pots, and plant the bulbs $1\frac{1}{2}$ inches to 2 inches deep; the largest ones should be 2 inches. Give the soil a light watering, just sufficient to damp it through, and stand them under a stage in a cold house or in a frame, and allow them to dry until the next day, when a light covering of leaf-soil or fibre may be given to them. This may remain until the young growth approaches an inch in length, when they must be placed on a side stage or on a shelf in a somewhat close greenhouse and given full light.

HIPPEASTRUMS.

The thorough ripening of these bulbous plants is now the most important item in their cultivation. Give abundance of air with the full sunlight on all bright days, and, if the pots are plunged, watering must be gradually withheld until the first or second week in September, when they should be dry enough to store away in a room or shed.

CINERARIAS AND PRIMULAS.

Attend to the potting as they require it, and do not allow them to become pot-bound until they are placed in flowering sized pots.

POINSETTIAS.

Where it is necessary to pot up a number of the old out-back plants no time should be lost in doing so. These generally produce smaller bracts than the young plants, but are most useful for cutting. Give the young stock plenty of light and air to prevent a drawn growth.

CROTONS.

This is a good time to put in a few dozen tops of the strongest shoots. These should be selected for good foliage and colour, and if placed firmly in fine peat and sand, in 3-inch pots, which should

and discontinued its use. A great number have been too cautious to risk placing their Orchids entirely in leaf-mould, for the simple reason that the majority are epiphytal plants, and to pot them entirely in leaf-mould much in the same way as one would a general plant in ordinary soil would be entirely against the laws of Nature, and for a considerable time viewed the subject in the same light. Though I can imagine that epiphytal Orchids do come in contact (in the forks of trees, &c.) with decaying vegetation to some extent, yet in the majority of cases we find that they grow almost free from any rooting material whatever, merely clinging to the branches in a manner that Ivy clings to our walls. However, experience teaches us that it is not altogether necessary to abide entirely by Nature's laws, for we find that many plants grow in a rooting material which they seldom, if ever, come in contact with in their native habitat. Regarding the same I may here mention an instance concerning the beautiful Cattleya Mossiae, which is not one of the easiest to grow, for we find that after a few years—that is, when they have lost their native vigour—they do in many cases greatly deteriorate, especially the

CATTELEYA MOSSIAE IN LEAF-MOULD IN THE GARDEN OF MR. PITT, ROSSLYN, STAMFORD HILL, NEAR LONDON.

be plunged in a sharp bottom-heat in a close case, they will make smart little plants for the winter in rooms.

EXACUM MACRANTHUM.

Those who possess a few old plants that have finished blooming should now cut them freely back and place them in a warm growing atmosphere, where they will quickly break into young growth, from which cuttings may shortly be taken to produce next year's stock of plants.

Wendover.

J. JAKUES.

ORCHIDS.

ORCHIDS AND LEAF-MOULD.

MANY comments have been made in THE GARDEN with regard to the cultivation of Orchids in leaf-mould. By some it is severely condemned, while others are greatly in favour of its use. Some by their experiments have met with great success, while others through failure have become disgusted with the material

Albino section. At a gentleman's establishment in this district, situated a short distance from these gardens, a number of Cattleya Mossiae have grown for the past twenty years, and not a bit of peat or moss has been taken on the place; the plants have been grown by the same gardener for the past fifteen years. The plants bloom well annually, and are in excellent condition. When the plants have required repotting pots have been taken and crooked in the same way as for general things, and they have been repotted entirely in fibrous loam broken to pieces about the size of a Walnut, a little sand or the rubbish from the potting bench mixed with it, and a few crocks to allow a free passage of water, and the soil is not pressed firm. Upon turning the plants out of their pots each time they were repotted the roots were found to have worked freely among the lumps of loam in all directions without actually penetrating them. At the same time, I should never be induced to pot an epiphytal Orchid in any portion of loam nor advise any one to do so, yet the above instance is sufficient to prove that epiphytal Orchids do and will thrive in a material they never come in contact with in their native home. This is what we find with regard to growing

epiphytal Orchids in leaf-mould. If these do not grow in leaf-mould in their native home we find they are better here (even in a London suburb) than in peat and sphagnum moss, not that a vast number of plants have here been experimented with, but sufficient to prove the value of the new material. In many cases the *Lælias*, *Cattleyas*, and *Lælio-Cattleyas* (which are the principal subjects of this note) have produced three growths in one year, and the way they break double and produce young growths from the backward eyes is remarkable.

The accompanying illustration represents *Cattleya Mossie* in leaf-mould. At the beginning of 1901 it had four bulbs and one lead, the same plant this season bearing twelve blooms, and now has eleven bulbs and seven leads, four of the latter showing flower sheaths.

I do not intend to convey that these are fine cultivated or well-bloomed specimens, but merely to show the rapid way they increase when grown in leaf-mould, and at present there is every indication that the plants will continue to do so.

REPORTING THE PLANTS.

When repotting clean pots are prepared, and one large crock is laid over the bottom with a few others or Fern roots as a substitute laid to the depth of about 1 inch more or less according to the size of the pot. Over these is put a thin layer of moss, freeing the roots from all old material or planting them intact as the case may demand. The plants are placed in their pots in the usual way entirely in leaf-mould, just as received from Messrs. Sander, St. Albans, merely picking away pieces of stick, stones, &c. The material is worked in among the roots or around the ball of the plants, and pressed moderately firm with a few crocks laid among it to allow a free egress of water. Sufficient space is left for a surface layer of fresh sphagnum moss.

WATERING THE PLANTS.

This is of the utmost importance, and special care must be taken to see that the plants are not over-watered, for if they are kept for any length of time in a saturated condition the roots will in consequence decay and the result prove disastrous. At the same time they must not be kept too dry at the roots or the plants would shrivel too much and the growths would most certainly be checked, especially during summer, and when the plants are growing. I think in some cases that beginners through fear of over-watering have gone to the extreme and kept the plants far too dry. Lightly sprinkling the surface instead of properly watering the plants when they are dry is a practice that should most certainly be guarded against. There are certain exceptions, for instance if we know that a plant has no roots other than on the surface, then a surface watering would suffice, but with plants that have become well rooted, these should, when they have become properly dry, be thoroughly watered, that is, given sufficient to moisten the whole material. If strict attention is given to these items when watering the plants there is no difficulty in cultivating *Lælias*, *Cattleyas*, and *Lælio-Cattleyas* in leaf-mould (providing other conditions pertaining to their culture are right), even near cities or large towns, and far better results may be anticipated in the pure fresh air of the country districts.

F. W. THURGOOD.

Rosslyn Gardens, Stamford Hill, London, N.

FLOWERING OF VANDA TERES.

At the recent show of Orchids, organised by the Société National d'Horticulture, several plants of *Vanda teres*, forming little bushes more than a metre in height and bearing numerous flowers, were observed in the collection exhibited by M. Opoix, head gardener at the Luxembourg. These plants were much noticed, for it is not easy to grow *Vanda teres*, and it rarely flowers in European collections. The collection of Baron F. de Rothschild at Waddesdon Manor, which contains many marvels, is especially celebrated for its magnificent *Vanda teres*; indeed, they are said to be without a rival in the world. Those of the Luxembourg can, however, well bear comparison. They do

great honour to the ability of M. Opoix, who is one of our best cultivators of Orchids. Our readers will, no doubt, be glad to have some hints on the process of culture used by M. Opoix. The most important point is this: the plants are kept absolutely dry during the winter, so much so that the leaves wrinkle up and present an appearance that would sadden the heart of those cultivators who are so eager to use the watering-pot. Nevertheless, the health of the plants does not suffer from this dryness, in fact, the effect is just the opposite.—*Chronique Horticole*.

NURSERY GARDENS.

MR. JAMES DOUGLAS,
GREAT BOOKHAM.

GREAT BOOKHAM is situated in a delightful part of Surrey, some three miles distant from Leatherhead, and it is there that Mr. James Douglas grows the Carnations for which he is so well known. On the occasion of a recent visit to Great Bookham the houses presented a beautiful sight—they were full of Carnation plants in flower. The variety was bewildering, Carnations of all types—selfs, fancies, bizzarres, and flakes—helped towards the display. *Malmaisons*, too, were included, but most numerous of all, perhaps, were the yellow ground fancies. Mr. Douglas has done much towards improving these flowers by the introduction of varieties of robust constitution, which bid fair to supersede the older and weakly varieties for border culture.

The new Carnations at Edenside are always of interest, and among them we may mention the following: Bookham Clove, large, pure white, Clove scented, with well-formed petals; Badoura, clear deep yellow, with rose margin; Othello, a Picotee with yellow ground and broad margin of crimson; Horsa, a yellow ground fancy, heavily marked and margined with crimson; Rabelais, clear yellow, with purple margin; The Dawn, bright pink, very free, an excellent variety for border culture; Yeoman, a white ground fancy, heavily marked with crimson; Mrs. Guy Sebright, light rose, a vigorous grower; Ivo Sebright, a sport from the preceding, flaked with heliotrope; and Lady Wolverton, rose-pink. Among the older and better-known sorts we noted *Artemis*, scarlet, flaked and streaked with lavender; *Bendigo*, bluish purple, quite a distinct attractive colour; *Guinevere*, buff ground, striped and marked with pink; Miss Audrey Campbell, a yellow self, large flowers; Lady Hermione, rose self; the blooms of this variety, which has received an award of merit from the Royal Horticultural Society, are of perfect form and always much admired; Mrs. Eric Hambro', white, large, and of excellent form; Seymour Corkran, a distinct shade of amber; this variety has also received an award of merit from the Royal Horticultural Society. Sweet Lavender is a fancy well named, the flowers are heavily marked with lavender upon a pale apricot-coloured ground. Trojan is still one of the finest white selfs, and Agnes Sorrell, dark maroon, among the finest dark Carnations.

Of yellow ground Picotees Mr. Douglas has a splendid collection, all the best varieties raised by Mr. Martin Smith and himself being included. Among so many really beautiful flowers it is difficult to mention a few as being of superior merit; but we may mention the following as especially fine: Childe Harold, flowers of elegant form, with deep rose margin; this variety has received several first-class certificates, and for three successive seasons won the prize given for the best bloom at the National Carnation Society's show; Borderer, bright yellow, edged with bright red; Lauzan, a distinct flower, clear yellow, with purple edge; Lady St. Oswald, margin of petals bright red; Galatea, with rose-red margin; Alcinous, lemon-yellow, margined rich purple; Diana, clear yellow, with broad scarlet margin; and Rosalind, a lovely Picotee with broad rose margin.

Mr. Douglas now has quite a number of varieties of *Malmaisons* raised by Mr. Martin R. Smith, and if they do not supersede the old blush and pink sorts they at least provide very welcome variety of colouring. Calypso, pale rose; Horace Hutchinson, rich scarlet; Mrs. Trelawny, dark salmon; Sir Charles Freemantle, very large, rich rose-pink; Iolanthe, bright rose; and Nell Gwynne, white, are among the most distinct. Mr. Douglas also has an extensive collection of show Carnations, by which are meant bizzarres and flakes. There are scarlet, crimson, pink, and purple bizzarres, purple scarlet, and rose flakes, and there are varieties of each of these types. White ground Picotees (red-edged, purple-edged, and rose and scarlet-edged), Tree or Perpetual Flowering Carnations and Pinks are also largely grown by Mr. Douglas, and many Carnation growers can testify to the good results obtained from his seed.

THE FRUIT GARDEN.

THE SUMMER PRUNING OF THE APPLE AND PEAR.

OF late I have come in contact with many owners of gardens much interested in gardening, and especially the hardy fruit growing aspect. I do not mean a fleeting interest, but a real practical interest in all technical details of work likely to lead to success. Few subjects connected with the growth of the Pear and the Apple appeal to them with greater force and interest than does a suggestion as to how the summer pruning of these trees should be carried out. It depends very largely on whether the summer pruning is attended to in time and in the proper way as to the returns and quality of fruit.

The remarks I am about to make refer more particularly to bush and pyramid trees, which it is desired to keep within moderate limits in somewhat small gardens. Taking an ordinary bush tree as an example, the time has now arrived to shorten the young shoots of this year's growth. The leading shoots (at the apex of the main branches, should have one-third their length cut off, and the lateral shoots growing out of the side of the branches should be cut to within seven leaves of their base. Many amateurs are very keen on knowing why it is necessary to cut the branches back in this way. To one gentleman who asked this question I was able to give an illustration of the value of the practice by showing him long barren branches on many of his trees quite innocent of fruit buds or growth of any kind, and that in the middle of his trees, where fruit should be abundant, the result of neglecting to adopt this practice. These branches were left their whole length, with the result that a few buds only, at the apex of the shoots, broke into growth, leaving the best part of the shoot—the base and the middle—barren of fruit or foliage for all time. It is to cause the furnishing of every branch in the tree with abundance of fruitful buds that the adoption of this plan is recommended. At the winter pruning they must be further shortened, the leading shoots, if at all weak, to 6 inches, and the stronger ones to 9 inches.

The lateral side shoots should be pruned back in the same way, the weak ones to two buds of their base, and the stronger ones to three. The practice of cutting away this growth in the summer affects the trees beneficially in other ways, but chiefly by the fact that their removal admits the warm rays of the sun to penetrate among the leaves and branches during late summer and autumn, helping materially to ripen the wood and develop strong wood buds. Indeed, if the summer pruning of these trees has been properly attended to, there will be very little winter pruning required. Every branch of a bush or pyramid fruit tree should be separated from another by at least 9 inches in summer when the foliage is on (in winter, of course, it will be more). Immediate attention to this important work in the fruit garden will make all

the difference in the quality and weight of the fruit crop the following season, as it will also in the building up of a handsome and fruitful tree.

OWEN THOMAS.

APPLE LORD GROSVENOR FOR AMATEURS.

In some seasons, and frequently in years of scarcity or failure, some sorts do so well that it is pleasing to note a crop, no matter what the variety or where grown. In our own case, and I have seen it in several others in the neighbourhood, Lord Grosvenor is bearing what may be termed a full crop. This is very strange, as many other trees have not got a single fruit. This points out the value of such sorts, as, though not a keeping fruit, its season being August and September, it is most valuable when others fail. I have rarely known this variety to fail, and this points out its value for amateurs who have little space and do not want too many varieties. Another point in its favour is that as a cordon-grown tree it is our best fruiter. Lord Grosvenor will grow where Lord Suffield fails. It is a remarkably free-bearing Codlin, and appears to do well in both light and heavy soil, and fruits in a very young state; indeed, so freely that thinning is necessary. With me this variety does well as a standard, and is an excellent orchard tree. The fruits are not small, and they cook well, lasting into the autumn when given cool storage.

G. WYTHES.

THE KITCHEN GARDEN.

BROAD BEANS.

ONE of the most useful summer vegetables is the Broad Bean, when the pods are grown so that they can be eaten without so much cooking to make them palatable. When in a seedy state they are coarse and of peculiar flavour. Of late years there has been considerable improvement in this vegetable, especially in the Long Pod section, a variety of which is illustrated. Doubtless the Long Pods of late years have found more favour than the old Broad Bean, of which the Broad Windsor is the type, and I am inclined to think that, in addition to a better shaped pod, the Beans also are of superior quality. Take the Giant Green variety; this seems to have been a cross between the Windsor and the Long Pod, and the result is a great gain. It possesses the size of the Windsor, with a much longer pod, containing seven to nine Beans, and these of a dark green colour, which is retained when cooked. The flavour is mild and delicate; indeed, if this is eaten in a young state, in my opinion they are equal to Marrow Peas.

There are other varieties, such as Mammoth Long Pod, Exhibition and Prolific Imperial Long Pod, and the older Johnsons, all well worth growing; and after these come the Broad Windsors, but these could easily be divided into two sorts, the white seeded and the green. I prefer the last named, and I think green Beans are of better flavour. I do not see any need for growing such varieties as the old Windsor with two or three Beans in a pod; it is much better to grow some of the newer race, which give a double crop on the same space.

The Broad Bean has got a bad name through being gathered too old. In our own case we grow this vegetable largely, but gather the pods daily. The Beans when shelled, are very little larger than Marrow Peas; this is

the best way to serve this vegetable, and those who now dislike them would probably change their opinion if they tried them in this way. I have heard it stated that it is wasteful to cook the pods so young. I do not think so, as when the pods are allowed to mature it checks growth, whereas if gathered in a young state there is less demand on the plants, and they yield for a longer time.

We get very early supplies by growing under glass early in the year and then planting out. I am aware many would hesitate to grow Broad Beans in pots, but I can safely say there are few vegetables that give a better return if planting out is done carefully, and much earlier produce is secured. The old system of sowing in October or November in an open quarter is not advisable, as the plants frequently pass through the winter till, say February, and then make new growth. Of late years this has been cut down by frost. We get much better results by sowing in a cold frame in January and planting out early in March. In this way pods are usually gathered early in June.

For late supplies the Broad Windsor section is the best. The varieties grown on a stiff soil do well, and many could eat these if the outer skin were removed before cooking. The Broad Bean should not be grown in poor land. I have referred to the cooking of Beans. On the Continent if they are at all old they are boiled and the skins rubbed off. There are several ways of cooking them to make them more appetising. I have seen them chopped up with fine Parsley and served with butter. I am aware that our old modes of cooking the Bean are mostly with bacon, but I think the best way is to cook the bacon first and then the Beans, as if cooked with the bacon it spoils the colour of the Beans.

The culture of the Broad Bean is so simple that few words are required. I have referred to an early lot raised under glass. Another sowing should be made in the open in February or as soon as the ground is workable, another three weeks later, a sowing in April, and another in May, will give a long supply; the two last sowings are made on an east or north quarter, and if possible in heavy soil or a moist position. The plants should be topped early to get pods low down the stems and a sturdy plant.

G. WYTHES.

TURNIP-ROOTED BEETS.

THE original name given to the first type of this Beet—the Egyptian Turnip-rooted—lends belief to the assumption that it was of Eastern origin. A standard like "The Vegetable Garden" (Vilmorin and Co.) makes no mention of the probable origin of the type, but catalogues of vegetable seeds published in the seventies are found stating that the "Turnip-rooted Beet is a new introduction from Egypt." The first of these Beets was flat, like a Milan Turnip, and irregular in outline, but careful selection has done much to impart symmetry of shape to newer introductions.

The Americans did much both to popularise and improve this type of Beet; probably the greatest advance has been made by home growers, and we have now Turnip-rooted Beets as handsome in shade as the finest type of model Turnip, of a deep bright crimson exterior, the flesh deeper still in colour, uniform in tint throughout the ball of flesh, tender and crisp. It has been said that "crimson-leaved Beets are all very rich in flavour," but the paler the flesh the less is there of a saccharine flavour.

The great value of the Turnip-rooted Beet lies in their earliness, which makes them invaluable for forming a part of a collection of vegetables exhibited early in July, and also because it is so well adapted for culture on both heavy and shallow soils, forming its bulbs upon the surface, and therefore secure from obstacles in the soil which might affect its shape.

When at Boston, a few days since, I had an opportunity of inspecting a most interesting trial of Beets and other vegetables in the seed trial grounds of W. W. Johnson and Sons, Limited, wholesale seed growers of Boston. Here is a deep and fertile black-brown loam of good heart and considerable depth, a model soil for vegetable culture. Of several stocks of Turnip-rooted Beets being grown here, Sutton's Globe was undoubtedly the best, and was represented by a very fine stock indeed; earliness, shape, and colour, all distinguishing characteristics; in outline perfect, the skin of a deep bright red colour, the flesh deep dark crimson, and uniform in tint throughout. This is a stock W. W. Johnson and Sons are growing largely. Mr. E. J. Deal, the manager of the firm, said that he had made trials of all the new Turnip-rooted Beets from America, but could find no advance on the Globe, either for earliness, colour, and shape. So far the Turnip-rooted Beets generally have green leaves, or only slightly tinted with colour. Mr. Deal is selecting a type with a leaf as bright in colour as that of any long Beet in cultivation. In the description given of an American selection known as Henderson's Crimson Globe, it is said to possess very large leaves, so it would seem that the American seed growers are proceeding along the same lines. It can be observed that small allotment holders are growing the Turnip-rooted Beets, and find it profitable to do so.

R. DEAN.

STRAP-LEAVED TURNIPS.

THE original white strap-leaved Turnip was of American origin, and was introduced to English gardens half a century or so ago; the leaves, instead of being lobed, as in the case of ordinary Turnips, were almost, if not quite, entire their whole length. Subsequently, a red-topped variety was selected, the Turnip itself being flattish-round instead of globular. The Milan Turnips, so useful on account of their earliness, are also strap-leaved; it is a type that is earlier and more refined than the ordinary strap-leaved, and whiter in the flesh.

THE GREEN LONG POD BEAN.

The Milan, a fine type of the Snowball, and also one of the Golden Ball, are the best garden Turnips. R. D.

SOCIETIES.

GREAT MARLOW HORTICULTURAL SOCIETY.

THE ninth annual exhibition of the above society was held on the 4th and 5th inst., and, notwithstanding the fact that the weather of the past few months has been very prejudicial to gardening in the district, an excellent display was brought together. Many of the gardens have been flooded, and operations have had to come to a standstill on several occasions, or the present gathering would probably have been the best of the series; as it was it proved to be the most creditable of the past three or four seasons. The arrangements, in the hands of Mr. A. D. Cripps and an energetic committee, were as good as could be wished for.

The centre of the large marquee was devoted to the groups and the specimen flowering and foliage plants, in both of which there were some grand exhibits. Mr. E. Riley, Marlow (gardener, Mr. T. W. Jordan), was first for a group of plants arranged for effect on a space of 72 square feet. The Begonias, Crotons, Hummers, and Greivilleas were all splendidly grown plants, and they were admirably staged. Sir W. Clayton, Marlow (gardener, Mr. J. Sharpe), was second with a display that had not sufficient flowering plants in it to produce the finest effect.

In the class for three specimen plants in flower, Mr. T. W. Jordan was again first, followed by Mr. E. Hay-Murray, Marlow (gardener, Mr. T. Blackmore), and Mr. J. Sharpe in the order named. In the winning set of three foliage plants, Mr. J. Sharpe had a grandly grown example of *Alocasia macrorrhiza variegata*, which was certainly one of the best plants in the show. Mr. T. W. Jordan was second, and Mr. T. Blackmore third. The latter included an enormous *Aspidistra* that would easily have made a score of respectable plants. Ferns, Caladiums, Fuchsias, tuberous-rooted Begonias, zonal Pelargoniums, Coleuses, and other plants were all admirably shown by the growers named above, by whom the whole of the prizes were divided. Mr. Jordan's Fuchsias and Begonias were magnificent.

There were several classes devoted to cut flowers, and in many cases the exhibits were above the average in the quality of the blooms, but they lost in effect through heavy staging. It was noticeable here again, as in the classes to which allusion has already been made, that Messrs. Jordan, Sharpe, and Blackmore annexed the bulk of the awards. Mr. A. D. Cripps, Marlow (gardener, Mr. J. Weaving), had the best annuals, splendid flowers, whose beauty was well-nigh lost by the crowded manner in which they had been dumped into the vases.

Fruit was creditably shown in the majority of the classes, the Peaches, Nectarines, and Madresfield Court Grapes, included in Mr. Blackmore's winning collection, being especially fine. Black Hamburg Grapes were not as good as usual, the season having been against the colouring. Sir H. V. Neale, Marlow (gardener, Mr. G. Martin), stepped in and won several prizes in this section, showing very strongly in some cases. Vegetables were handsomely staged by the exhibitors named, and also by Mr. R. C. Lehmann, Marlow (gardener, Mr. C. Goodman), who was conspicuously successful. Table decorations and bouquets of wild flowers were shown in immense numbers, but except the table of wild flowers there was nothing particularly meritorious.

In the non-competitive section, which was such an excellent feature of the show, Mr. R. W. Hudson, Danesfield, Marlow (gardener, Mr. J. Gibson), sent a most beautiful group of plants, which were not only well grown but admirably arranged; this was one of the best exhibits in the entire exhibition. Mr. T. Blackmore also sent a fine group "not for competition." The trade supported the fixture in a most praiseworthy manner. Mr. C. Turner, Slough, contributed some charming Roses; Mr. E. F. Such and Mr. W. Henley, both of Maidenhead, showed exceptionally good herbaceous flowers; Messrs. J. Laing and Sons, Forest Hill, arranged well-grown Caladiums, Palms, tuberous-rooted Begonias, Dracenas, and other plants; and Mr. R. Owen, Maidenhead, staged in an artistic manner a group of Begonias, Francoas, and Eulalias.

UPTON SHOW.

THIS popular Cheshire event was held on Wednesday, the 12th inst., in the grounds at Upton Lawn, kindly lent by Mr. J. M. Frost, who during the day held a garden party, at which many of the best local families were represented. There was a slight falling off in the number of entries, these being more than compensated for by the even quality throughout. The centre of interest was undoubtedly the table decorations, some very charming effects being accomplished. Nothing could have looked richer than the first prize, set up with excellent taste by Miss J. S. Robinson, and composed of *Scabiosa caucasica* intermingled with *Gypsophila paniculata*; the second went to Mrs. MacGillcuddy for white and yellow Begonias and Maidenhair Fern; third, Miss Linda Frost for Iceland Poppies and Asparagus plumosus. The groups arranged for effect from Mr. B. Glegg (gardener, Mr. J. Ford) and Major MacGillcuddy (gardener, Mr. E. Stubbs) were deserving of much praise, the latter gentleman with well-coloured Caladiums, Crotons, Acalyphas, Dracenas, Eulalias, and capital Lilliums and Celosias, making a noble effect.

In the herbaceous section the cut flowers, such as *Alstroemeria aurea*, *Gaillardias*, *Phloxes*, *Helenium pumilum magnificum*, and Lilliums, Miss Humberston (gardener, Mr. R. Wakefield) set up a most convincing stand; second, Mr. W. H. Walker. The Carnations and Picotees from the former were of excellent quality. Roses—from Major MacGillcuddy were in fine condition, as were the Coleus from Mr. W. B. Moss.

Indoor fruit was not a strong competition, Major MacGillcuddy taking honours with Buckland Sweetwater and Mr. F. Richmond with Black Hamburg and the collection.

Others successful in classes were Miss Humberston and Messrs. J. M. Frost, F. Richmond, B. Glegg, and W. B. Moss. A splendid collection of Carnations came from the gardens of the late Judge Wynne Foulkes, and Roses and herbaceous plants in capital condition from Messrs. Dicksons, Limited, Chester.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.

AT a meeting held on June 24 last first-class certificates were awarded to the following: *Ondotoglossum crispum* var., from Mr. W. C. Baron V. Boetzelaar, at Maartensdigh, and to *Rosa polyantha* (seedling), an improvement on *Ruphrosyne*, from Messrs. Gratama Bros. and Co., Hoogeveen. Certificates of merit went to the following: *Delphinium* hybridum Prof. Van Thersom, from Mr. W. V. Veen, Leiden; *Biota orientalis aurea* (seedling), from Mr. A. Spaargaren, Hulsiner; *Cattleya Mendell* variety, from Mr. P. W. Lutvans, Baarn, and to *Dianthus plumarius Moehelimi*, from Mr. B. Ruys, Dedemsvaart, and to *Papaver orientale Mahoney* from the same exhibitor. A cultural commendation went to Mr. J. M. Goes, for a specimen *Gnaphalium Leontopodium* (Edelweiss), and a silver medal for a collection of hardy perennials from Mr. B. Ruys, Dedemsvaart.

At a meeting of the society on the 29th ult., first-class certificates went to the following: *Anthurium J. H. Tromp* Meesters, from Mr. J. H. Tromp Meesters, Steenwigh; *Begonia Fleur de Neige*, *Chrysanthemum frutescens Sahuret*, and *Fuchsia Andenhean* Heinrich Henkel, from the General Adrean van Suleten Juijnbrooschool, at Frederiksoord; to *Canna indica Jumm*, from Messrs. Van Namen Bros., Zurijsrecht. Certificate of merit to *Hemantus fascinator*, from Mr. A. J. Van Der Bero, Amsterdam; *Rose Lady Roberts*, from Mr. H. J. Beernit, Aalter; *Chrysanthemum segetum Helios*, and *Alamson miniata superba* both from Messrs. Groenewegen and Co., Amsterdam. A botanical certificate went to *Ageratum mexicanum crispum*, from Messrs. Groenewegen and Co., Amsterdam, and cultural commendation to *Chrysanthemum Soleil d'Octobre*, from Messrs. Bodes and Lemhes, Dordrecht, for excellence of culture, and a silver medal to a collection of *Delphiniums* from Mr. W. Van Veen, Leiden.

SHERBORNE GARDENERS' SOCIETY.

THIS is a flourishing society, having about 120 members, a large number of them being honorary, and are either business men or gentlemen in connexion with the High School; the larger portion of them take a deep interest in horticulture. Its flourishing condition is due to its having good officers, the president having held the position five years. He is chairman of the Urban District Council, and consequently has a position on the bench, an office not often held by a working gardener (he is head gardener at King's School). On a recent Wednesday Canon F. B. Westcott (headmaster of Sherborne School) entertained the members in the gymnasium. About sixty sat down to tea, the company including Major McAdam, Mr. John Dean (president), and numbers of honorary members. Afterwards the secretary (Mr. C. B. Bret) announced that letters of apology had been received from Messrs. G. F. Stokes, John Dingley, J. Pooley, Copp (Holnest), T. Turton (Castle Gardens), Stacey (Merriott Nurseries), Dyke (Milborne Port), and others. Mr. Crook, of Forde Abbey, Chard, proposed a vote of thanks to Canon Westcott for his hospitality, and congratulated the society on its able officers. Mr. L. A. Penny seconded the vote, which was carried with applause. Then followed bowling on the headmaster's lawn and various games in the gymnasium, which were succeeded by a smoking concert. Instrumental music was rendered by a string band formed by a few of Sherborne School boys, under the conductorship of Mr. Hodgson, Mr. Regan being the leader.

GATEACRE SHOW.

THE thirty-second annual fixture was held on the 12th inst., in the charming grounds of the president, Colonel W. H. Walker, M.P. The competitive section fully maintained its high position, the vegetables especially being well staged.

As usual a number of exhibits were sent from the leading gardens in the neighbourhood, and were awarded certificates of merit: Groups of plants by Mr. J. P. Barham, gardener to Colonel W. H. Walker, M.P.; Mr. C. E. Moorman, gardener to Colonel J. B. Gaskell, J.P.; Mr. R. Brignshaw, gardener to H. D. Bateson, Esq.; Mr. Jones, gardener to S. Sanday, Esq.; Mr. G. Cliffe, gardener to J. B. Atherton, Esq. For fruit Mr. T. Hayes, gardener to Miss Janlon, Mr. T. Hitchman, gardener to M. Earle, Esq., J.P., and Mr. Thomas, gardener to Mrs. Harrison. Cut flowers by Mr. J. Rothwell, gardener to S. S. Bacon, Esq., J.P., W. D. Skinner, Esq., and H. Middlehurst, Esq. Orchids by Messrs. John Cowan and Co.

The judges spoke highly of the care and success that the cottagers had shown in their gardens, and to the general success that had attended their efforts. Mr. J. Glover, secretary, has fulfilled his duties in an exemplary manner during the whole life of the society.

ROCK FERRY.

THIS annual exhibition was held in charming weather in the grounds of Mrs. Paterson on the 18th inst., which proved most acceptable after the cramped space of last year. The entries were most satisfactory, but from some unknown cause many exhibits were not staged.

In the open class for a group of miscellaneous plants arranged for effect, Dr. Cooke (gardener, Mr. G. Osborne) won with a well-arranged combination, in which Palms, Crotons, Ferns, and Caladiums made a pleasing groundwork for Lilliums, Carnations, Geraniums, *Phloxes*, and other

flowering plants. For the smaller class, G. Altin, Esq. (gardener, Mr. H. Morris) led with a bright lot, in which Caladiums and Lilliums proved highly effective; J. E. Kennion, Esq. (gardener, Mr. E. Stokes) was second with a fresh lot. Single specimen stove or greenhouse plants: Mr. G. Osborne won with a well-furnished Croton; Mrs. Paterson (gardener, Mr. Ferguson) second with a good *Cycas*.

Two exotic Ferns: E. Evans, Esq. (gardener, Mr. C. Jones) scored with a good *Nephrolepis* and a *Davallia*. Six stove or greenhouse plants: Mr. G. Osborne won with good plants, his Crotons being well coloured.

One exotic Fern: G. E. Grayson, Esq. (gardener, Mr. W. Thomas) won with *Adiantum cuneatum*.

Four stove or greenhouse plants: Mrs. E. Peel (gardener, Mr. J. Bryan) led with fresh plants.

Two Fuchsias: The same exhibitor won with small fresh plants.

Two Begonias: Mr. Thomas won with fine varieties.

CUT FLOWERS.

This section was well filled and generally good throughout. For a floral display, 4 feet by 2 feet, J. W. Hodgson, Esq. (gardener, Mr. S. Bell) won with a pleasing combination lightly arranged.

For one bouquet, Mr. J. Williams was the winner, and held the same position for flowers grown in the open.

Six bunches, stove or greenhouse: Mr. S. Bell led with choice varieties.

Twelve bunches grown in the open: Mr. J. Lee won with a very fine lot of clean and fresh flowers.

Six bunches: Mr. W. Millington had the finest out of seven good entries for six *Cactus Dahlias*, J. Clarke, Esq. (gardener, E. Pownall) scored.

Collection of Carnations: A. J. Oakshott, Esq. (gardener, Mr. G. W. Findlow) won in a strong competition.

Twelve Roses: E. Kellock, Esq. (gardener, Mr. R. Jones) scored with good blooms, and upheld his position with six varieties.

Twelve Asters and six: J. Robey, Esq. (gardener, Mr. A. Smith) won in both cases.

Twelve bunches Sweet Peas: Mr. S. Bell won with fine flowers, but lacked the finish they deserved by too cumbersome bunches.

FRUIT.

Six varieties: Mrs. Paterson (gardener, Mr. T. Ferguson) won with Grapes Muscat of Alexandria and Black Hamburg, Melon Pride of Stourbridge, Peaches Dr. Hogg and Stripling Castle, and Nectarine Pine-apple.

Hardy fruits, P. C. D. Castle, Esq. (gardener, Mr. C. Irvine) with a good lot.

Two bunches Black Hamburg, T. B. Kendall, Esq. (gardener, Mr. J. Richards), with well finished types.

Two bunches any other black, the same exhibitor scored with well finished bunches of Madresfield Court.

Six Peaches, M. Clover, Esq. (gardener, Mr. A. Crisp) won with fine fruits of Dymond.

Six Nectarines, the same exhibitor, with well coloured Red Roman.

Green-fleshed Melon, Mr. E. Stokes, with Carter's Early Favourite.

Scarlet fleshed, Mr. C. Jones, with a well netted seedling. Nine Plums, Mr. C. Irvine was first, and the only exhibitor.

Black Currants, Mr. C. Irvine had the only lot; and for red Mr. J. Richards proved the winner; white, Mr. A. Crisp. Raspberries, Mr. W. Millington; Cherries, Mr. A. Crisp; Gooseberries, Mr. J. Lee; Apples, culinary, Mr. J. Bradshaw, with large fruits; dessert, Mr. H. Davies; Pears, the same exhibitor.

VEGETABLES.

These were of uniform good quality, showing that in this adverse season good specimens may be obtained by careful culture.

For nine distinct kinds, H. D. Treilawny, Esq. (gardener, Mr. J. Clarke), scored with fine examples of Cauliflower, Celery, Carrots, Onions, Turnips, Scarlet Runners, Tomatoes, and Potatoes; G. H. Pilkington, Esq. (gardener, Mr. J. Little), an excellent second. Three dishes Potatoes, Mr. J. R. Carter won with clean even tubers. Twelve Tomatoes, Mr. J. Clarke scored with excellent fair sized fruits of Polegate, and for six fruits Mr. H. Davis proved the winner. Two Cucumbers, Sutton's Malcheen, Mr. J. Clarke; one dish of Peas, the same exhibitor, with large well-filled pods; Broad Beans, Mr. J. R. Carter, with large pods; French Beans, Mr. J. Lee, with an unnamed dish which was noticed throughout the whole of this section; Scarlet Runners, Mr. J. Clarke.

The amateurs and cottagers' section was well filled with exhibits highly creditable to the competitors, the vegetables especially showing good culture.

Awards of merit were made to Mr. H. Middlehurst for a collection of Sweet Peas set up in his well-known style; Mr. Smith, group of plants, and Mr. Ernest Bell for cut Pansies. The arrangements were under the direction of Mr. T. B. Kendall, chairman, and Mr. R. Theaker.

EAST ANGLIAN HORTICULTURAL CLUB.

AT the August meeting of this club members did not turn up in quite such strong force as usual owing to the holiday season. The president (Mr. J. Powley, F.R.S.) read an interesting paper upon "British Ferns in Norfolk." There were nineteen species out of a total of thirty-four natives of Britain to be found in the county of Norfolk, and many districts (notwithstanding the hawkers) still produce fine plants of the families of the *Pteris*, *Ceterach*, *Osmunda*, *Lastrea*, *Polystichum*, and *Asplenium*. He also explained the methods of making hardy Fern rockeries and the most suitable varieties, but he strongly urged those present that if they found an uncommon variety not to grub all of it up when a small plant would suffice.

Mr. H. B. Dobble, Pine Banks, Thorpe, also read a paper entitled "Our Bird and Insect Allies." Mr. Dobble has long been a close observer of the flora and fauna of Norfolk, and the remarks he gave of the various foods of our feathered friends, many of which he had examined to discover the

contents of their crops, showed the enormous appetites, yet usefulness of these friends of the gardener. Although the insect world produced the worst of garden foes, yet Nature had somewhat balanced itself by insects to destroy these. Unfortunately, human agencies in destroying the foes destroyed the friends, some measure of which was due to the fact of their not being sufficiently known.

A capital discussion followed both papers. The exhibition tables were well stocked with grand examples in all fruit, flower, and vegetable sections. In the non-competitive section Mr. George Davison, Westwick House Gardens, brought up a charming collection of Montbretias, including the new seedling named after himself, and an unnamed variety after the style of Germanica, but of a more reddish tint. Hobbies, Limited, sent up two blooms of the curious coloured striped H.P. Rose of French origin (Roger Lamberton).

In the competitive classes the most striking feature was a special prize for six varieties of Carnations, three blooms each, offered by Mr. J. F. Betta, Park Lane, Norwich, who is an ardent admirer of this flower. Mr. A. Hipper, Eaton, was the fortunate winner out of seven stands, his blooms of the new variety, Heckington, coming in for much commendation. Mr. E. C. Ramus, Ethebert, and Mr. C. H. Hines, Trowse, were first and second for special prizes offered by Messrs. Daniels Brothers, Limited, for the best dish of their No. 1 Tomato. The second section of the competition for the silver bowl, presented by Mrs. E. T. Boardman, took place, Mr. F. Carrington taking twenty-two points against twenty-one by Mr. C. H. Hines.

The monthly competitive exhibition was well filled, and some close contests were witnessed. For Peaches Mr. F. Williams, Old Catton, had some well finished fruit, and the Apricots (outside grown) from Mr. C. H. Hines, Trowse, considering the adverse season, were very fine. This latter exhibitor also secured many points for vegetables, his Cauliflowers being the best shown. Mr. C. H. Fox (gardener to Sir E. B. Mansel, Bart.), Old Catton, achieved the fine performance of taking first for Plums, Gooseberries, Tomatoes, and Peas, and these from a garden somewhat high and light land. A silver medal given by the Ichthemio Guano Company for the best three single Fuchsias was won by Mr. W. Eash, Thorpe Hamlet.

WILTS HORTICULTURAL SOCIETY.

THROUGH the kindness of the Lord Bishop of Salisbury, the annual exhibition was held on the 12th inst. in the charming grounds attached to the Palace, and was in every way a success. The committee, under the able guidance of Mr. Sly, the energetic secretary, deserve success, providing as they do so good an exhibition, and such charming music as that supplied by the band of the Royal Marines from Portsmouth.

PLANTS.

If not numerous, possessed much quality. There were several divisions, space, however, will not admit of a full detailed account, but rather a summary of the leading features.

For a group of miscellaneous subjects arranged for effect in a space 16 feet by 9 feet, Mr. A. Robey, gardener to Colonel Loyd, Harnham Cliff, Salisbury, won the premier award; Mr. A. G. Bedford, nurseryman, East Harnham, Salisbury, was second.

In the class for nine specimens, four in flower and five foliage, Mr. G. Hall, gardener to Louisa Lady Ashburton, Melchet Court, Romsey, was the only exhibitor, but so good were the bulk of his specimens that he was worthily awarded the premier prize. Allamanda Hendersonii was marvellous.

Ferns were finely staged by Mr. Hall, who won easily for six with Davallia Mooreana, fully 8 feet in diameter. Coleus were grandly coloured, neatly trained, dwarf plants, the best six coming from Mr. J. Pickett, gardener to E. F. Pye Smith, Esq., Salisbury.

CUT FLOWERS.

were numerous and good. For twenty-four Roses, not less than sixteen varieties, three competed. Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, was an easy winner with really good blooms of Beattie Brown, A. K. Williams, Marie Baumann, Mme. Hoste, White Lady, Caroline Testout, and Souvenir de Pierre Notting; Dr. Beaton, Lynton, was second.

Cactus Dahlias were numerous and good. For twenty-four in not less than twelve varieties, Mr. J. Bryant, Salisbury, was an easy winner; Mr. H. H. Mills, gardener to W. H. Fletcher, Esq., Pye House, Salisbury, second; Mr. J. Page, gardener to Miss Seymour, Knolly House, Salisbury, third. For twelve show or fancy varieties, Mr. J. Miller, Sherfield, was an easy winner; Mr. E. Rogers, Sherfield, second. Pompon Dahlias in twelve bunches of six blooms each made a great show. Mr. Neville won quite easily with neat highly-coloured blooms; Mr. A. Maple, Shirley, second; Mr. Prigden, Salisbury, third. For eighteen bunches of cut flowers there was keen competition and a good result. Mr. J. Page, gardener to Miss Seymour, Knolly House, Salisbury, was an easy first, with Pentstemon and Phloxes in variety, Tritomas, and a huge bunch of Inula macrocephala; Mr. Mills second. For twelve varieties, Mr. H. Brown, gardener to the Hon. R. Wyndham, Clouds, won quite easily; Mr. Robey second.

Carnations and Picotees were splendidly shown, especially by Mr. Neville, who won first for eighteen blooms with typical examples of Dorothy, a seedling, a yellow ground fancy with crimson stripes; Mrs. F. W. Flight, Ampton, Guinevere, Gil Polo, Oakley, Heather Bell, Bertha, Nuthall, and Comtesse Verulam; Mr. T. Welby, gardener to the Hon. L. Greville, Woodford, second; Mr. Gates third. Five competed.

Sweet Peas were magnificently staged. For twenty-four bunches, Mr. A. Maple, Aldermoor, Shirley, was an easy first; Mr. Mills, gardener to H. Fletcher, Esq., Pyt House, Salisbury, second; the Rev. J. Macdonald, Sherfield, third. Especially good were the blooms in the class for twelve bunches staged by A. C. Jones, Esq., Exeter House, Salisbury;

Mr. C. Haskins, Salisbury, second; with Mr. H. G. Ware, Chullen Leigh, third.

Table decorations are always an interesting feature here. For a table 6 feet by 4 feet, dressed with flowers, &c., no fewer than seven competed, making an attractive display. Miss M. Carv, Stratford-sub-Castle, was awarded first place with an arrangement of dark semi-double Roses, with a suitable accompaniment of greenery. Mr. R. H. Jeffery, Nurling, was second, with an especially effective arrangement of Orchids, Lily of the Valley, Francoa, and Asparagus Sprengeri. From remarks freely made during the afternoon this table was the more admired; Miss C. Burt was second. Messrs. Keynes, Williams and Co., Salisbury, won for two bouquets. For a vase dressed for dinner table decoration there were many entries. Miss E. King, Salisbury, won quite easily, as she did also for a basket of flowers, and also for a vase of wild flowers, grasses, &c., in all cases showing much taste in arrangement.

FRUIT.

is always well shown here. This year was no exception to the rule. For a collection of eight distinct sorts, Mr. Hall was an easy first; Mr. W. Mitchell, gardener to J. Willis Fleming, Esq., Chilworth Manor, a good second.

Grapes were numerous and good. Muscat of Alexandria showed a little want in finish. Mr. Mitchell was first for two bunches; Mr. Hall second; Mr. Chalk, gardener to G. Read, Esq., Salisbury, third. For three bunches Black Hamburg, Mr. Mitchell staged lovely clusters, weighing 4lb. each, large even berries and well finished, and won the premier award; Mr. Hall was second with smaller examples; Mr. Chalk third. For three bunches any other white, Mr. Hall staged exceedingly fine examples of Foster's Seedling, and secured the leading award. For two bunches any other black variety, Mr. Mitchell won with magnificent examples of Madrasfield Court; Messrs. Chalk and Hall following in the order given.

Melons were well shown. Windsor Castle won for Mr. Robey the premier award, Mr. Hall coming next with Rebeby Seedling.

Peaches were extremely fine, Mr. Mitchell winning with Sea Eagle; Mr. Hall following closely. The last named had the finest dish of Nectarines—Pine-apple; Mr. J. Page, gardener to Miss Seymour, Knolly House, second.

MISCELLANEOUS.

Messrs. B. Ladhams, Limited, Shirley Nurseries, Southampton, had a very fine display of hardy flowers, which added much to the interest of the show. Especially fine were the Gallardias Rowanham's Queen, B. Ladhams, Brilliant, Lobelia cardinalis Andrew Barlow, rich purple, was very fine; Pentstemon Newbury Gem, Chrysanthemum Maximum Monarch, an improved form of the purest white, Helianthus rigidus superblimus, a distinct advance on the type, Coreopsis Eldorado, Phloxes, &c.

Mr. Maurice Frichard, Christchurch, had an equally interesting collection of hardy flowers, particularly noticeable were the Gladiolus Nanceanus, Childsall, and Lemoine types. Kniphofias were very fine, especially Nobilis, Lemon Queen, Montbretia, Rayon d'Or, Cimicifuga cordifolia, Potentilla Vesuvius, Phloxes, &c. Some of the most striking Gladioli were Livonia (Childsall), light red, immense flowers, white mottled throat; Columbia, light orange-scarlet, extra large blooms; Ethel, soft rose, white and crimson throat; Baron Joseph Hulot, rich velvety violet. Mrs. Beecher, deep rose-crimson, pure white throat, spotted crimson; and Solfaterre, sulphur yellow, with round dark crimson spots.

BISHOP'S STORTFORD HORTICULTURAL SOCIETY.

THE thirty-fourth annual show of the above society was held on the 12th inst. at The Grange, an admirable place for the purpose. It was a great success in every way. As at most exhibitions of late years, the large plant classes were the weakest feature of the show, but in every other department there was no lack of entries, and the materials staged were excellent.

A special tent was devoted to ladies' classes, such as cut flowers and dinner-table decorations. No less than thirty-one tables were set up, and many were very beautiful, and in addition there were five classes for floral decorated fireplaces. Fortunately, the weather, though dull during the early part of the day, was dry, and the attendance was almost a record one. It is estimated that 9,000 persons were present, and we heartily congratulate the society on their continued success, and the committee and secretaries on their good work.

PLANTS.

The leading feature was the group arranged for effect. Though the competition was not great, the groups staged were excellent. The premier award was given to Mr. Harrison, gardener to Colonel Archer Houbton, Hallingbury Place, and was noted for its artistic arrangement, lightness being the chief feature. The second prize was well deserved, and could easily have been first with the splendid materials at command, but the back of the group was too packed, large Palms being too much used, Mr. W. Clark, gardener to Mr. G. Gold, The Limes, Stanstead, being the exhibitor.

For stove and greenhouse plants in flower only two lots were staged, though these were very bright, especially the one which came from Mr. J. Barker, The Grange (gardener, Mr. G. Beech). He was first, and Mr. W. Holland second (gardener, Mr. W. Brown). For foliage plants Mr. Harrison was a good first, Mr. Beech being second with smaller plants, but well grown; Mr. C. Gold, jun., third.

For twelve plants grown in 8-inch pots, six in flower and six foliage, Mr. G. Beech was the only competitor, but with well-grown specimens. It is an interesting class, and should command more attention with better prizes. The same exhibitor was an easy first for Ferns, and he staged some beautifully grown plants.

Begonias, always a great feature at this show, were less numerous than usual. For a group Mrs. A. Taylor was first, and Mr. W. Smith second, the latter having very choice varieties, but not quite forward enough. Mrs. A. Taylor was also

first for Begonias in hanging baskets, some beautiful drooping varieties being grown for this purpose; Mr. F. Wilby second, and Mr. W. Smith third. Mrs. Taylor was also first for six doubles, Mr. Smith second, the same exhibitors having the best Gloxinias, Mr. Barker the best Ivy-leaved Geraniums, Messrs. Taylor and Barker the best double zonal, and Messrs. Smith and Barker the best single zonal.

Coleus were well staged, and, though not large, were finely coloured, the prizes being awarded to Messrs. Taylor, Barker, and W. Holland in the order named. Fuchsias were a poor class, but good plants were staged by Mr. Beech.

DECORATIVE TABLE PLANTS.

were very good here. The awards were given to Mr. J. Balfour (gardener, Mr. A. Jeffries), Mr. Beech, and Mr. Harrison. Another feature at this show is early Chrysanthemums, groups being arranged, and the variety most frequently staged is Mme. Desgrange, and these were exceptionally fine, Mr. Harrison having the best group, Mr. Barker being a good second, having a good frontage of Fern.

CUT FLOWERS.

In the hardy perennial section Messrs. Paul and Son, Cheshunt, had a grand lot, not a single weak bunch in the twenty-four that were staged; Mr. H. A. Hare being second with smaller bunches, but well staged.

There was no lack of competition in the Sweet Pea classes, the best collection for a special prize being awarded to Messrs. Barker, Edwards, and Smith in the order named. For twelve bunches of Eckford's varieties, Mr. H. A. Hare, Miss Newman, and Mr. Beech were the winners. In this class there were some splendid flowers. In the smaller classes Messrs. Routledge, Calvert, Johnson, and Mrs. Gold were successful.

For twelve bunches of stove and greenhouse plants, Mr. Beech had no opposition, but staged beautiful flowers. For hardy flowers, Miss Newman, Mr. Gold, and Mrs. W. Gee were the leading exhibitors, this being a fine class. For Chrysanthemum blooms, Messrs. Harrison, Johnson, and Watts led in the large class, and Messrs. Beech and Abbott in the smaller. Mr. Barker had the only stand of single Dahlias, but the doubles were very good, and Messrs. Barker and W. G. Gold had excellent flowers. Carnations were a special feature, but Roses were not a large class, Messrs. Barker and W. G. Gold and Mrs. A. Taylor having the best stands.

FRUIT.

This was one of the best points of the show, especially the forced fruit. Baskets of mixed fruit were staged, and though pleasing to the eye, it is not the best way to note defects. Some beautiful fruit was staged by Colonel A. Houbton and Mr. J. Barker, these gentlemen leading in most of the classes. Mr. A. Jeffries had the best Black Hamburg Grapes in both classes; second, Mr. Harrison. The last named also had grand Muscates; second, Messrs. Gosling; third, Mr. Barker. There were two very beautiful collections of fruit, Colonel A. Houbton and Mr. J. Barker being the exhibitors. Some very good Peaches were staged, Sir James Blyth, Bart., Colonel A. Houbton, and Mrs. A. Taylor being the leading exhibitors in the order named. The best Nectarines came from Sir J. Blyth, Colonel A. Houbton, and Mr. C. H. Davis. There was no lack of small fruits, the awards going chiefly to the above exhibitors.

VEGETABLES.

were a great feature, and the first prize was a beautiful collection, Mr. A. Jeffries leading, having good Alderman Peas, Exceolior Onions, and well-grown Syon House Potatoes; Mr. G. Beech was a good second, having very choice dishes; Mr. Harrison being third. In the smaller classes Mrs. Taylor, Messrs. F. Calvert and Abbott were successful.

TABLE DECORATION.

Miss A. F. Harwood, Colchester was first, having Tea Roses and coloured foliage and sprays of Francoa; Miss Camp, Sawbridgeworth, being second, using Jasmine flowering freely on the table; Miss Blyth being third with a pretty arrangement of Sweet Peas.

MISCELLANEOUS.

Messrs. Rivers, Sawbridgeworth, had a splendid group of fruit trees in pots, receiving a first-class certificate for their new Peach Peregrine; Messrs. Paul, Cheshunt, had splendid groups of herbaceous plants, also Messrs. Ware, Feltham; Mr. A. Perry, Winchmore Hill, had beautiful Water Lilies; Mr. S. Mortimer, Farnham, had some very fine stands of Dahlias, receiving a first-class certificate for Queen Alexandra, a beautiful flower.

ROYAL HORTICULTURAL SOCIETY.

SCIENTIFIC COMMITTEE, AUGUST 4.

PRESENT: Dr. M. T. Masters, F.R.S. (in the chair), Messrs. Hooper, Saunders, and Bowles, Dr. M. C. Cooke, Revs. W. Wilks and G. Henslow, hon. sec.

Late-flowering Plums, &c.—Mr. Hooper had noticed that various modifications occurred in flowers of fruit trees at the present time. Petaloid sepals and semi-doubling of petals with two carpels, forming twin Plums, were not uncommon. It was observed that in the common cultivated double Cherry there are always two foliaceous carpels present. Pear trees, &c., have also produced a second crop of flowers, which are borne on the ends of the young shoots instead of on spurs.

New Crocus.—Mr. Bowles exhibited dried specimens and drawings of *C. caspius* from Russian Talych, S.W. Caspian, with a white flower tinted with rose. He also showed the autumn-flowering *C. Scharojani* from the Caucasus. It is of an orange colour, and carries the leaves of the last season simultaneously.

Papaver panoninum.—Mr. Wilks showed a plant from Central Asia (see "Garten Flora," 1882, page 296, Taf. 1095) remarkable for a crescent-shaped black band near the base of each petal.

Cucumber diseased.—Mr. Davis of Bitton, Bristol, sent roots of Cucumbers which failed. Mr. Saunders reports a

THE BEAUTIFUL CAMPANULA LACTIFLORA, ONE OF THE FEATURES OF THE LATE MR. G. F. WILSON'S GARDEN AT WISLEY, AND NOW THE NEW GARDEN OF THE ROYAL HORTICULTURAL SOCIETY. (See page 123.)
(From a photograph by Miss Willmott.)

follows upon them: "I found that the extreme base of the stems were attacked by small worms belonging to the family Enchytracidae, which are nearly related to the earth-worms, and are well-known pests at the roots of plants; they were undoubtedly the cause of the unhealthiness of the plants. Lime water will kill them in a few minutes if it can be made to reach them; thoroughly drenching the soil with this fluid might be of use, though I do not know what effect it might have on the plants. They, however, are so injured that I should imagine the best thing to do would be to pull them up and burn them, and burn or bury deeply the soil in which they grew."

Cucumbers diseased.—Dr. Cooke reported upon some fruit badly attacked received from the neighbourhood of Bristol. It appears to be due to a fungus new to science, which he has named *Cladosporium scabiei*. A full description will be recorded in the Journal of the Royal Horticultural Society. He strongly recommends "that all diseased fruits be removed and destroyed at once, and those remaining should be sprayed to preserve them from attack. Condy's fluid, diluted, should be tried as less likely to injure the fruits than copper solutions." No effort should be spared at once to stamp out the pest."

DRILL HALL MEETING.

THE meeting of the society on Tuesday last was exceptionally good for the season, and much interest was created by the double Hollyhocks, which recalled the old days before the disease almost obliterated the race. There were very few Orchids, but these were good. The Potatoes from Messrs. Dobbie and Sons of Rothsay were of great interest, and the Apples from Messrs. Spooner and Sons, Hounslow, Middlesex, were also meritorious.

FLORAL COMMITTEE.

Present: H. B. May, Esq. (chairman), and Messrs. Charles T. Drury, George Nicholson, R. Dean, J. Jennings, William Howe, George Reuthe, Charles Dixon, Charles Jeffries, J. W. Barr, Charles E. Pearson, R. C. Notcutt, William Cuthbertson, H. J. Jones, Charles E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, George Paul, Amos Perry, George Gordon, J. Fraser, and E. T. Cook.

The collection of Gladioli from Messrs. Kelway, Langport, was undoubtedly the finest thing in the show on this occasion, some 250 spikes of these noble garden flowers being set up. In a collection so good, so large, and replete in beauty, it is extremely difficult to particularise, for all are good and praiseworthy. We take, however, at random as we meet them, for a whole table from end to end of the Drill Hall was filled with these flowers. Such pronounced things as Kenwyn, soft cream and buff; Lord Iddeleigh, deep scarlet, white throat; Queen Alexandra, salmon-scarlet, with crimson and white throat; Mrs. Foster, lilac and white; Majus, scarlet and yellow throat; Eclipse, salmon-scarlet, with deeper flaking; Frank Miles, yellow buff, very charming; Mrs. F. Field, an approach to pure white, very fine spike; Sir Evelyn Wood, a shade between crimson and claret, very showy and intense in the self and rich colour; Baden-Powell, scarlet and white; Andromeda, a deep cream-yellow, shaded and purple-crimson stripes in throat; Duke of Devonshire, crimson-scarlet, white throat, is good; Mr. Chamberlain, deep salmon-scarlet and yellow throat; Nautch Girl, cerise-scarlet, white throat and crimson feather; The Sultan is very dark, a purplish plum shade, and a bloom not altogether at variance with the naming; Prince of Orange is good, and quite upholds the colour involved; Grandeur is a lovely yellow kind; Princess Royal, a delicate salmon pink, quite remarkable in size, in spike, and colour. These are a few, and they embrace many good things in this well-nigh unique collection. Silver-gilt medal.

A charming group of Gladioli came from Baron Schroeder, Egham. These were described as Canadian hybrids, but probably they are varieties of *G. Lemoline*, yet possessing a wide range of colour. We noted also forms of *Childal* and *Nanacenus*; indeed, the group was composed of these three types. Silver medal.

The Phloxes from Messrs. Paul and Son, Cheshunt, were very fine, as might naturally be expected in so moist a year. In the general selection shown we noticed *Fiancee*, white; *Avalanche*, white; *Coquillet*, scarlet; *Miss Pemberton*, rose-salmon, very fine; *Etna*, scarlet; *Grevin*, rose. Other things shown by this firm were *Colutea* in variety, *Capinus Betulus purpurea* (Purple Hornbeam, a beautiful tree), *Catalpa purpurea*, and several kinds of *Tamarix*, of these *T. festivals* and *T. odesana* were very lovely.

Hardy flowers and alpine were from Messrs. Peed and Sons, West Norwood. *Helenium*, *Montbretia*, *Tritoma*, *Echinops*, *Phloxes*, and such things were in large numbers. Boxes of dwarf alpine, *Sempervivum*, *Sedum*, *Campanula*, *Saxifraga*, &c., were also in this group.

A large and beautiful exhibit from Mr. H. B. May, Edmonton, contained chiefly *Bouvardias* in the best varieties. These were arranged in blocks, and we noted *Pink Beauty*, *Hogarth flore-pleno*, *Delicata*, *Maiden's Blush*, *Alba odorata* (very fine), *The Bride*, *King of Scarlets*, *President Garfield*, *President Cleveland*, very rich scarlet; *Vreelandi*, white; *Bridemaid*, a charming double pink among interesting things; *Solanum jasminoides*, *Swainsonia galegifolia* alba, and *Campanula Mayi* are worthy of mention. Silver-gilt medal.

Herr W. Pfitzer Stuttgart showed a fine strain of frilled *Begonia* in many colours; also *Begonia Bavaria*, a dwarf and very freely flowered scarlet form.

Some beautiful blue Water Lilies came from Mr. Leopold de Rothschild, Gunnersbury House (gardener, Mr. J. Hudson), and of these we noted *William Stone*, *Stellata* (Berlin var.), *Stellata pulcherrima*, very fine; and *N. gigantea* Hudsonii, a noble flower of soft blue and giant proportions; *Nymphaea George Hudson* is the night flowering *Nymphaea*, the carmine-rose shade, one of the most remarkable we have seen. A really splendid novelty.

Hardy flowers were shown by Mr. E. Potten, Cranbrook, Kent. *Phloxes*, *Trollius*, *Helenium*, *Platycodon grandiflorum*, and *Pentstemons* in variety being largely shown. The latter were very showy and good, and represented a capital strain.

Hollyhocks from Messrs. Webb and Brand, Saffron Walden, were stately and good, white, rose, carmine, yellow, flesh

buff, and maroon being among those shown. None of the sorts were named, we therefore assume the whole to be raised from their excellent strain of seed. A most interesting and old-world exhibit. Silver-gilt medal.

Hardy flowers from Mr. Amos Perry were bold, showy, and good, and consisted of *Helenium*, *Heuchera*, *Monarda didyma* alba, *Phloxes*, *Bocconia*, *Veronica* in variety, *Coreopsis tenuifolia*, *Buddiella variabilis*, *Geums*, and many other good things in season. The rare *Astilbe chinensis*, with pinkish flowers, was also shown. Silver medal.

Messrs. Ladhams, Limited, Southampton, staged a fine lot of *Gaillardias* as *Golden Gem*, *Sulphur Gem*, and *Shirley*, very rich in colour, together with *Lobelia Andrew Barlow*, and *Chrysanthemum maximum Monarch*, a fine large white, and the perpetual flowering *Pink Florence*, a lovely flower; besides other *Pinks*. *Pentstemon Newbury Gem* was also in good condition. Silver medal.

Messrs. Barr and Sons, Covent Garden, showed Gladioli, tufted *Pansies*, *Phloxes*, *Campanula carpatica China Cup*, a large and good flower, together with hardy *Heaths*, *Gerbers Jamesoni*, and a beautiful set of *Water Lilies*. *Gaillardias*, *Kniphofia glaucescens*, *Scabiosa caucasica* and *Asclepias tuberosa* were also shown.

Messrs. Veitch, Limited, Chelsea, contributed a beautiful batch of *Streptocarpus*, in many colours from white to rose, and many shades of blue. The same firm also showing in good form *Senecio olivorum*, *Astilbe Davidii*, and the white *Watsonia Meriana Ardenii*. Silver medal.

Messrs. J. Cheal and Sons, Crawley, showed *Cactus* and *Pompon Dahlias* in variety. Mrs. Perkins, Cheal's White, *Uranus*, gold and orange; *Aunt Chloe*, crimson maroon, being of the best in the former set. Single *Dahlias* were also finely shown, and in their cleanly expanded flowers attracted a good deal of attention. Silver medal.

Messrs. Veitch and Co., the Royal Nurseries, Exeter, had several exhibits of great interest. One was *Fagus Zlatia*, a Golden Beech, which will prove very valuable in the landscape we think. It is a good colour, and also the delightful *Coriaria terminalis*, with its clusters of golden fruit, like golden Currants, and the yellow *Chrysopsis villosa* var. *Rutteri*. We shall refer to these again.

A small group of Gladioli came from W. C. Bull, Esq., Ramsgate, one *Sulphurea* being quite distinct. Some eight kinds were shown, and nearly all were of white and sulphur.

FLORAL COMMITTEE AWARDS.

The following received an award of merit:—

Begonia Bavaria.—An exceedingly dwarf kind with cerise-scarlet flowers in large numbers on stems some 6 inches high. It is an ideal bedding plant, and we are pleased to learn that the exhibited plants were lifted from open beds merely for exhibition. The plants were shown by Herr W. Pfitzer Stuttgart, Germany.

Gladiolus Lady Muriel Digby.—A very large flower and a great acquisition. The colour is deep sulphur-yellow, with chestnut-crimson stains on the lower petals. A very handsome kind. Shown by Messrs. Kelway, Langport.

Gladiolus Nymph.—A pure white, widely-winged flower, that at the base internally has a decided and clear zone of crimson-red. A distinct feature is that the flowers are arranged around the spike, not in the usual second form generally seen. From W. C. Bull, Esq., Ramsgate.

Tamarix Odesana.—A very beautiful gathering of this lovely and graceful shrub. The colour of the flowers is delicate lilac, but the beauty of the plant is in the grace of foliage coupled with the delicacy of the flower tint and the slight drooping character withal. Shown by Messrs. Paul and Son, Old Nurseries, Cheshunt.

FRUIT COMMITTEE.

Present: George Bunyard, Esq. (chairman), Messrs. H. Balderson, James Cheal, H. Easing, W. Bates, A. Dean, J. Baahaw, G. Kelf, H. Markham, Owen Thomas, J. E. Veitch, J. Jacques, J. Willard, G. Wythes, and F. L. Lane.

Messrs. Dobbie and Sons, Rothsay, sent a superb exhibit of Potatoes, chiefly representing early and second early varieties. Of those exhibited we noted *British Queen*, *The Factor*, a splendid keeper; *Royal Kidney*, *White Elephant*, *Harbinger*, *Alpha*, *Eightfold*, a fine-coloured round; *Sir J. Llewellyn*, *Ninetyfold*, *Duke of York*, *Sharpe's Victor*, *Beauty of Hebron*, *Windsor Castle*, *Lord Beaconsfield*, &c. Taken in toto, the exhibit was very fine, and, in uniformity as well as in quality, represented an ideal state of perfection. The tubers were set in ample-sized baskets that gave every opportunity for comparison. Silver medal.

Strawberry Royal Sovereign in splendid form, from Mr. Leopold de Rothschild, received a cultural commendation.

Messrs. Spooner and Sons, Hounslow, showed a very interesting collection of Apples, one a seedling reminding one of *Alfriston*. *Beauty of Bath* was splendid, even in shape, and excellent in colour.

Mr. Wythes, Syon House Gardens, Brentford, showed an excellent Melon, which promises exceedingly well, but was not quite ripe enough for an award, and also a new break in *Custard Marrows*. Both of these we shall refer to again.

Tomato Coronation, a large red kind, was from Mr. H. Parr, New Barnet, the same gentleman exhibiting *Vegetable Marrows*.

A fine Runner Bean, *Hackwood Success*, came from Mr. J. Bowerman, Hackwood Park, Basinstoke. Many of the Beans were 10 inches long. It is evidently a very fine novelty.

FRUIT COMMITTEE AWARDS.

NEW FRUIT.—PEACH PERFECTION.

This came from Messrs. Rivers and Sons of Sawbridge-worth. It is a large and delicious fruit, a warm crimson in colour, and in every way a thoroughly meritorious addition. The tree forces well, bears abundantly, and is very hardy. We have referred to it elsewhere, and hope to figure it next week. Award of merit.

Bean (Runner) Hackwood Success.—A very handsome Runner Bean, and a great cropper withal, bunches being shown containing as many as eight Beans. Many of the selected Beans must have been 10 inches long. From Mr. J. Bowerman, Hackwood Park, Basinstoke.

ORCHID COMMITTEE.

Present: Henry Little, Esq. (chairman), and Messrs. J. O'Brien, H. M. Pollett, W. Cobb, James Douglas, Francis Welleley, G. F. Moore, H. Ballantine, H. J. Pitt, E. Hill, W. Buxall, F. J. Thorne, E. A. Tracy, W. H. Young, and T. W. Bond.

In a choice collection from Messrs. Stanley, Ashton and Co., Southgate, we noted *Laelia amandae* (natural hybrid), *Cattleya Loddigei*, *Laelio-Cattleya massangeana*, *Oncidium incurvum* var. *album*, very pretty and chaste, *O. varicosum* var. *Rogerali*, and a choice *Laelia Iona*, Southgate var. that received the award of merit. Silver Flora medal.

The lovely group from Messrs. Sander and Sons, St. Albans, contained *Odontoglossum Adriane*, *Miltonia vexillaria*, *Cypripedium Cassandra* (*sanderianum* × *gowerianum*), *Dendrobium formosum* giganteum, *Laelio-Cattleya blancheyana*, *Cypripedium Uitor* from C. Lawrenceanum × C. *sanderianum*, *Phaius maculata*, golden, with brown margin to lip; and the pretty *Phalenopsis Emeralds*, the miniature blossoms very distinct. Silver Flora medal.

Captain Holford, Westonbirt (gardener, Mr. Chapman), had a beautiful group of Orchids, which contained one plant of special merit, namely, *Cattleya callistoglossa excelsa*. It had five spikes bearing several blooms each, and the colouring is delightful; the flowers are very large, light rose-purple sepals and petals, and deep purple lip with yellow throat. A cultural commendation was given it. Among other things in this group were *Cattleya eximia*, splendidly grown; *Vanda coarctata*, beautiful in colour, a noble spike; *Cattleya Germania superba* (scholfieldiana × *haryanum*), lovely colour, rose sepals and petals, and purple lip; *Laelio-Cattleya blancheyana*, and *Cattleya intricata*. Silver medal.

Messrs. Charlesworth, Bradford, showed another of their interesting groups to which we look forward with so much pleasure at these fortnightly meetings. We noticed in the collection *Laelio-Cattleya callistoglossa*, *Catasetum callosum*, *Laelio-Cattleya Carlinei*, *Oncidium dactyle*, *Cypripedium youngianum* superbum, *Sphro-Laelia heatonensis*, *Braasla lawrenceana longissima* (very fine), *Odontoglossum haryanum*, *Cattleya Niobe*, *Laelio-Cattleya blancheyana*, *Laelia Iona superba*, lovely colour, very deep and attractive; *Laelio-Cattleya Adolphus superba*, orange with purplish spots, *Stanhopea oculata*, and *Dracophyllum difforme*. Silver medal.

Mr. Ingram, Elstead House, Godalming, showed *L.C. spicata fulgens* (L. *pumila* × *gigas*), a flower of beautiful colour, also *Laelio-Cattleya Meteor* (*Laelia pumila* × *Cattleya bowringiana*), conspicuous for its dark lip.

Mr. Jeremiah Coleman, Gatton, showed *Laelia elegans* var., a bronzy rose colour and deep crimson lip, the side lobes of which are white, touched with pink.

Mr. C. J. Lucas, Warnham Court, Horham (gardener, Mr. G. Duncan), had *Laelio-Cattleya blancheyana*, a flower of very warm colouring and deep lip, Mr. Lucas also showed *Cypripedium Lord Derby*.

Cypripedium Phoebe (C. *laevigatum* × *bellatulum*) came from Mr. J. Brooks, gardener to Mr. W. M. Appleton, Tyn-y-Cad, Weston-super-Mare.

ORCHID COMMITTEE AWARDS.

Lord Auckland showed a superb spike of *Oncidium luridum guttatum*, it measured nearly 8 feet in length, and a cultural commendation was most deservedly given.

Laelia Iona Southgate var.—A lovely flower; the sepals are rich rose, and the lip undulated and deep maroon-crimson. From Messrs Stanley, Ashton and Co., Southgate, N. Award of merit.

LECTURE ON THE "HOLLYHOCK."

In his opening remarks, Mr. Webb referred to the stateliness and grandeur of the Hollyhock, a remark that all who know and have grown these plants will heartily agree with. The great range of colour was touched upon and the great age of the group as garden plants. In passing it was mentioned that Gerard, some 300 years ago, noticed two double sorts, viz. double red and double purple, and these were apparently the first of all the race of doubles known to cultivators of the flower. Following, Mr. Webb observed that Mr. Charles Baring early in the last century took up the cultivation of the flower, and later on handed on the work to the late Mr. Chater, who raised and distributed in 1847 one of his notable sets of double varieties. From this time the flower was cultivated with success, and indeed so cultivated until the appearance in 1873 of the Hollyhock disease, which, in its virulence, carried off the choicest and best of these flowers to be lost for all time. In referring to the healthiness of the plants, and how the cultivation affected this, we were pleased to find so much emphasis laid upon the question of a hardy upbringing, and likewise the fact that wintering under glass was now entirely abandoned. All the best named sorts now are raised from seed, the latter, if sown in the open in May or June, quickly germinates and forms a small tap root. This little root in the replanting is severed in two for the express purpose of hastening the production of those small fibrous roots so valuable in the ultimate planting to permanent positions. Stress was laid upon the requirements of the Hollyhock as regards its cultivation in the open, a deep trenching of the soil to 2 feet deep, and keeping the better soil below was advocated, with the addition of heavy manuring if the finest spikes are desired. August or September was urged for the planting, for if deferred to a much later date the plants failed to pass the winter in the same successful manner. Plenty of room and therefore of air about them was regarded also as essential, and 3½ feet apart was given as a good distance.

The necessity of watering prior to and during bud and flower formation, was also touched upon, together with a splash of short litter to stay evaporation. To secure the spikes against wind is but a natural item in such stately plants. Timely thinning of the buds, and this in a distinctly uniform way, was suggested to render the flowers of the best. All lateral shoots must be removed, and equally all the growths from the base of the plants, while in dry weather it is well to continue the watering even when the plant was in bloom. An ideal spike, as regarded by Chater, was made up

of flowers with thick or substantial petals, smooth edge, and full centre with compactness. Guard petals should be stiff and firm. The flowers should be regularly arranged, thinly disposed, yet without any open space. When flowering is past the plants may be cut down, and later may be lifted, and if desired to retain them another year for flowering, heel them in in light soil under a south wall, and give a light protection with Bracken. Then when replanted in March they should be thinned of many shoots. The other modes of increase, as by cuttings, by grafts, as well as by budding on pieces of root, after the manner of Roses on Briar roots, having been referred to in detail, attention was directed to the present day disease, for which no specific was equal to it. It was, however, observed that sheep-dip containing Tobacco juice and carbolic acid was useful when syringed on the under surface of the leaves in warding off an attack, while the same being most useful in keeping down any attack of red spider. In spite of all these things, however, it was finally urged that if hardly grown from the beginning the cultivator had nothing to fear from the Puccinia or Hollyhock fungus to-day.

SHREWSBURY FLORAL FETE.

ONCE again we have to record a most successful summer show at Shrewsbury. The great floral fête held on Wednesday and Thursday last was as good as has been held, and this is saying a great deal. The first day proved an ideal one, warm, and the sun shone brightly, notwithstanding the unfavourable predictions that had made everyone pessimistic. As a display of horticultural produce the Shrewsbury show is unequalled in the kingdom, and although we were all prepared, on account of the bad season, to be content with a display below the average, there was no need, for generally speaking the exhibits were of the usual excellence. With the exception of the white Grapes, which were poorly finished, there was little to complain of as regards the fruit; in fact, some of the Peaches and Nectarines were remarkably well coloured. The winner in the great Grape class was Mr. Goodacre, with a splendid exhibit, but he was only two points ahead of the Scotch growers, Messrs. D. and W. Buchanan. In a way the second prize exhibit was most meritorious, for out of the twelve bunches shown by Messrs. Buchanan no less than seven gained the full possible points. The reason their total was less than that of Mr. Goodacre was that for most of their varieties the maximum points were less than for the Grapes shown by Mr. Goodacre, that is to say, they are less difficult to grow to perfection.

The groups of plants were a splendid feature, the chief prize this year being won by Mr. Vause, Leamington. Sweet Peas made a grand show. One tent was practically filled by exhibits in two competitions, each for twelve distinct varieties. They made a fine display. Hardy flowers, Dahlias, Gladioli, pot plants, floral decorations, vegetables, and miscellaneous groups were other conspicuous features. The display of *Amaryllis* by Mr. Chapman, gardener to Captain Holford, was unique at this season and much admired. Shrewsbury floral fête is as notable for the gathering of gardeners as for a display of gardening produce. Among those present were Sir Trevor Lawrence, Bart., Captain Holford, the Rev. C. Wolley Dod, Messrs. W. Robinson, Harry Turner, Owen Thomas, N. F. Barnes, Mackellar, W. Crump, P. Blair, S. T. Wright, James Hudson, George Norman, T. A. H. Rivers, James Douglas, David Thomson, Wallis, and others. As is usual, Messrs. H. W. Adnitt and W. W. Naunton, the honorary secretaries, were tireless and most successful in their efforts to please both exhibitors and judges.

PLANTS.

Throughout the show this section was fully up to the usual Shrewsbury standard, bold, massive, and showing the highest cultural skill; Crotons in the larger classes were not so well coloured, but this was more than compensated for by the flowering plants. Mr. Cypher was first with *Statice intermedia* (8 feet through), *Bougainvillea Cypharii* and *sanderiana*, fine; *Allamandas grandiflora* and *nobilis*, *Ixoras Williamsii* and *Duffii*, splendid, *Statice profusa*, *Crotons Warrenii* and *Sunset*, *Stephanotis*, *Erica marnockiana*, *Phoenix rupicola*, and *Kentia fosteriana*. Mr. Vause was a fairly good second, the plants much smaller. *Croton Queen Victoria*, capital; *Stephanotis floribunda*, *Ixora Fraserii* and *Bougainvillea sanderiana*, and an *Erica* in fine form; Mr. W. Finch was a moderate third.

For six stove and greenhouse plants in bloom or foliage, S. Timmis, Esq. (gardener, Mr. B. Cromwell, Cleveley, Allerton, Liverpool), staged superb specimens of *Ixora Duffii* (7 feet through), and carrying a score of huge brilliant heads, *Lapageria rosea*, grand; *Statice profusa*, *Ixora Williamsii*, and *Kentia fosteriana*; second, Mr. J. Cypher, with splendid *Statice intermedia* and *profusa*, and *Stephanotis floribunda*; third, Mr. W. Vause.

For a group of ornamental foliage plants, Palms, Ferns, &c. (300 square feet), Mr. W. Vause gained the coveted position. There was a bold central mound topped by a fine Phoenix, the pyramid being admirably formed of *Acers*, *Liliums*, *Crotons*, *Dracenas*, and *Caladiums*, with others somewhat unfinished and a feeble background. Mr. J. Cypher, who was placed second, had a remarkably fine background in arched style, the foliage and flower effects being unusually effective. The very handsome mounds, consisting of the choicest Orchids, &c., were brought well to the front. The group was certainly weighty, but the general consensus of opinion was that the positions ought to have been reversed.

For a group of miscellaneous foliage plants Mr. Cypher made an excellent display, the blending of light and shade being unusually effective, without detracting from its graceful appearance; second, Mr. J. Thompson, Derby, who very finely demonstrated the brilliant effects which can be produced by single specimens in particular. The third was taken by the Earl of Carnarvon, Bretby Park (gardener, Mr. J. Read), with a handsome treatment, lacking in its want of greenery.

For single specimens (stove and greenhouse) Mr. W. Vause was first with a choice *Erica*; second, Mr. Finch, with a superb *Ixora*.

The great plant class in the show was undoubtedly that for thirty stove and greenhouse plants in pots not exceeding 10 inches, not less than ten in bloom. Four competed. The first, from Lord Harlech, Brogyntyn, Oswestry (gardener, Mr. Lambert) was probably one of the best exhibits ever seen at this or any other show. In foliage *Maranta sanderiana*, *Crotons Evansianus* and *Andreanus*, *Ixoras Duffii*, *amabilis*, *Prince of Orange*, and *Pilgrimii*, and *Allamanda Williamsii* were magnificent. Mr. Sutton Timmis was a brilliant second, *Ixoras Duffii* and *Coccinea superba* and finely-coloured *Crotons* being most convincing; Mr. J. Cypher a fine third.

A group of Begonias in pots for effect brought three competitors, Mr. Fred Davis, Woolashill, near Pershore, clearly leading with flowers of wonderful substance and form; second, Messrs. Blackmore and Langdon; third, Messrs. B. R. Davis, Yeovil.

Collection of thirty miscellaneous plants in 5-inch pots: Lord Harlech first with specimens similar to those in 10-inch pots; second, Mr. Timmis.

The 100 feet groups were lacking in colour, but as regards arrangement they contained many pleasing features: First, Mr. T. Kynnersley, Leighton Hall; second, Mrs. Swann, Halston Hall; third, Mr. H. Hayhurst.

FRUIT.

Dessert table decorated with plants and flowers: First, Mr. Goodacre, Elvaston Castle Gardens, with 118½ points. Full points were obtained for no dish; the best were Apples, 6½ out of 7; Melons, 7 out of 8; Nectarines, 7½ out of 8; Pears, 6½ out of 7. General arrangement for effect gained 8 out of 10 points, and beauty of flower and foliage 6½ out of 8. Madresfield Court and Black Hamburg Grapes, Marguerite Marillat and Dr. Jules Guyot Pears, Princess of Wales and Bellegarde Peaches, Washington Apple and Pine-apple Nectarine were fine dishes. *Francoa* and *Chironia* were the flowers used for decoration with *Gypsophila* and *Asparagus*. Mr. G. Mullins, Eastnor Castle Gardens, Ledbury, was second with 107 points. Gros Maroc Grape, Melon Royalty, Cherry Bigarreau Napoleon, Nectarines Stanwick Elruge and Lord Napier, and Peach Bellegarde were the best. *Tritoria*, *Francoa*, *Gypsophila*, and *Selaginella* were used for decoration. Mr. R. Dawes, Temple Newsam, was third with 97 points, showing some good dishes, Peach Dymond, Nectarine

Stanwick Elruge, and Grape Madresfield Court particularly. There were no more entries.

Champion Grape Class.—Twelve bunches of Grapes, in four or more varieties: First, Mr. Goodacre, Elvaeton Castle Gardens, with 115½ points. The bunches were of excellent quality throughout, one bunch gained full points, viz., Muscat Hamburg, another bunch of the same variety only lost half a point, and Madresfield Court also lost half a point only. They were really a fine lot. This exhibit won third prize for decoration. Messrs. D. and W. Buchanan, Kippen-by-Stirling, were only two points behind with 113½ points. They gained full points for seven bunches, viz., Muscat of Alexandria (three times), Cooper's Black (twice), Alicante and Alnwick Seedling, half a point only was lost on bunches of Alnwick Seedling (twice), Cooper's Black, Muscat of Alexandria, and Alicante, a splendidly grown lot of fruit; Mr. W. Shingler, Melton Constable, was third with 107½ points. Full points were obtained for Madresfield Court, Alnwick Seedling, and Gros Maroc; Mr. W. A. Coates, gardener to Colonel Platt, C.B. was fourth with 105½ points. The first prize for decoration was awarded to this exhibit; Mr. R. Dawes, Temple Newsum, was fifth with 80 points, and second for decoration.

Sixteen dishes of fruit: First, Mr. J. H. Goodacre, Elvaeton Castle Gardens, with a really good display. Grapes Madresfield Court and Black Hamburg were best, while Pear Souv. du Congrès, Brown Turkey Figs, Lord Napier Nectarine, and the Melons were very good. Mr. J. Dawes, Ledbury Park Gardens, was second, the Sea Eagle Peaches, Lord Napier Nectarines, and Cooper's Black Grape being the best dishes. Mr. Jordan, Impney Hall Gardens, was third. Hero of Lockinge and Frogmore Scarlet Melons were very good; also Violette Hâtive Peach.

Mr. Jordan, the third prize-winner, won first prize for decoration. He used Cattleyas, Lælias, Cypripediums, and Asparagus, as well as some pretty Crotons and other small plants. Mr. Goodacre was second for decoration, and Mr. J. Dawes, Ledbury Park Gardens, third.

Twelve dishes of fruit: First, Mr. R. Dawes, Temple Newsum, with very good Peaches Dymond and Bellegarde, Stanwick Elruge Nectarines, Gros Maroc and Madresfield Court Grapes, and Ring-leader Melon; second prize for decoration was awarded, Montbretias and Gypsophila being used. Mr. J. Jones, York House Gardens, Malvern, was second for fruit and first for decoration—Pink Carnations, Francoas, and Gypsophila. Nectarine Violette Hâtive, Peaches Violette Hâtive and Stirling Castle, and Madresfield Court Grape were best.

Nine dishes of fruit: First, Mr. C. Wilkins, gardener to C. F. K. Mainwaring, Esq., Oteley, Ellesmere. This exhibit won the second prize for decoration, which consisted of Caladium argyrites. The Peaches and Nectarines were finely coloured. Second, Mr. J. Langley, Tedmore Hall, West Felton, with splendid Prince Englebert Plum; third, Mr. S. Bremmell, Overley, Wellington. The first prize for decoration was given to this exhibit. White Sweet Peas, Tritonias, and Crimson Lychnis were effectively used. Mr. C. Roberts, Halston Hall, was fourth for fruit, and third for decoration.

GRAPES.

Four bunches of Grapes: First, Mr. T. Lambert, gardener to Lord Harlech, with fine Madresfield Court and Muscat of Alexandria; Mr. C. Richardson, gardener to J. Bayley, Esq., Llanfairfechan, was second with large bunches, but small berries; third, Mr. C. Wilkins, Oteley, Ellesmere.

Two bunches Black Hamburg: First, Mr. Goodacre, who showed well; second, Mr. Langley, Tedmore Hall Gardens; third, Mr. J. C. Tallack, Shipley Hall Gardens.

Mr. Goodacre was first for one bunch Black Hamburg; Mr. J. Langley, second; and Messrs. D. and W. Buchanan, Kippen, Stirling, third. All were finely finished. There were several more entries.

Two bunches Madresfield Court: First, Mr. W. Shingler, Melton Constable, with perfectly finished examples; second, Mr. Goodacre; third, Mr. J. Langley. Four more entries.

Two bunches Alicante: First, Mr. W. Shingler with huge, well-coloured fruit; second, Mr. A. H. Hall, Prestbury.

Two bunches Gros Colman or Gros Maroc: First, Mr. W. Shingler with very large-berried bunches; second, Mr. J. Goodacre, very fine also; third, Mr. G. Davies, gardener to Mrs. F. Alderson; All showed Gros Colman.

Two bunches White Muscats: First, Mr. F. W. Everett, gardener to Mrs. Gough, Tal-y-Cafn, with very large, small-berried, fairly well coloured fruit; second, Mr. C. Richardson, Llanfairfechan; third, Mr. Goodacre with well coloured, though loose bunches. There were five more entries.

Single bunch, White Muscats: First, Messrs. D. and W. Buchanan, Stirling, with good Muscat of Alexandria, fairly well coloured; second, Mr. A. H. Hall; third, Mr. Goodacre.

Two bunches (White), any other variety: First, Mr. Goodacre with Buckland Sweetwater; second, Mr. W. A. Coates, gardener to Colonel Platt, C.B., with very large bunches Foster's Seedling, poorly coloured; third, Mr. F. W. Kerr, Chorley, Lancs., with the same variety.

One bunch Diamond Jubilee: First, Mr. Jordan with a finely finished bunch; second, Mr. Goodacre; third, Mr. A. H. Hall. Messrs. Buchanan gave the prizes in this class.

OTHER FRUITS.

Six Peaches: First, Mr. W. Powell, gardener to C. T. Weatherby, Esq., Adlestone, Surrey, with Bellegarde finely coloured; second, Mr. R. Dawes, Temple Newsum Gardens; third, Mr. F. Jordan, Impney Gardens.

Six Nectarines: First, Mr. W. Pilgrim, Bodorgan, Anglesey, with River's Orange; second, Mr. G. Lilley, Gaddesby Hall Gardens, Leicester; third, Mr. F. Jordan, Impney Gardens.

Six Apricots: First, Mr. R. Grindrod, Whitfield, Hereford, with Early Red; second, Mr. W. L. Bastin, Buscot Park Gardens; third, Mr. W. Humphries, Holme Lacy.

Green flesh Melon: First, Mr. Goodacre, with a seedling; second, Mr. S. Bremmell, Overley; third, Mr. A. Ruddock, Bangor.

Scarlet flesh Melon: First, Mr. R. Lawley, Adoote, with Sutton's Triumph; second, Mr. F. Jordan; third, Mr. W. A. Webster.

White flesh Melon: First, Mr. G. Lilley, with Hero of Lockinge; second, Mr. F. Jordan; third, Mr. W. A. Webster.

Mr. Goodacre was first for twelve Gage Plums, twelve yellow Plums, twelve purple Plums, and for twelve red Plums.

Mr. A. Ruddock, Tan-y-Bryn, Bangor, won for a dish of Cherries.

CUT FLOWERS.

Messrs. Jenkinson and Son, Newcastle, Staffs, were first for a bridal bouquet; Messrs. Perkins and Son, Coventry, second. Messrs. Jenkinson were first for a bridesmaid's bouquet; Messrs. Perkins second.

Messrs. Perkins were first for a ball bouquet; Messrs. Jenkinson second.

Ball and bridal bouquets, Orchids excluded: First, Messrs. Perkins and Son, Coventry, using Carnations; second, Mr. W. J. Garner, Altrincham.

Messrs. Perkins were first for a feather-weight bouquet.

Stand of cut flowers: First, Mr. J. Nixon, gardener to O. Robinson, Esq.

Design in cut flowers: First, Messrs. Pope and Son, King's Norton, with an anchor in white. Very effective.

Messrs. Perkins were first for six button-hole bouquets and six sprays; Mr. William Tresseder, Cardiff, second.

Hand-basket of cut flowers: First, Messrs. Perkins and Son, Coventry, with Carnations; second, Mr. W. Tresseder, Cardiff, with pink Carnations.

Basket of cut flowers: First, Messrs. Jones and Son, Shrewsbury, with Orchids, Anthuriums, &c.; second, Messrs. Pope and Son, King's Norton.

Bouquet of Cactus Dahlias: First, Messrs. Pope and Son; second, Mr. W. Tresseder, Cardiff.

Floral harp: First, Mr. W. Tresseder, Cardiff,

with an excellent exhibit; second, Messrs. Perkins and Son.

Floral wreath: First, O. Robinson, Esq., Alderley Edge; second, Mr. W. Tresseder.

Floral cross: First, Messrs. Perkins and Son; second, Messrs. Jones and Sons, Shrewsbury.

SWEET PEAS.

Eighteen distinct varieties (prizes by Mr. H. Eckford): First, Mr. J. Chisholm (gardener to Hugh Aldersey, Esq.), Aldersey Hall, with a bright and well-arranged lot; second, Mr. T. Jones, Ruabon, with some fine flowers also; third, Mr. Hall, Knotton Hall Gardens, Ellesmere. There were several more entries and a good display resulted.

Twelve distinct varieties (prizes by Mr. Robert Sydenham): First, Mr. W. Shropshire, Market Drayton, with a splendid lot, good blooms, and distinct colours; the Rev. J. Duncombe was a good second; Mr. J. Chisholm, Aldersey Hall, was third; and Mr. A. G. Holford, Offley Hay, Salop, fourth. The entries in this class were very numerous, and the exhibits almost filled the staging around the tent.

Six vases (prizes by Messrs. Jones and Sons, Shrewsbury): First, Mr. T. Jones, Ruabon; second, Mr. Edward Jones, gardener to the Misses Howland, Berriew; third, Mr. C. C. Peplow, Bicton.

Twelve varieties: First, Mr. J. Chisholm, Aldersey Hall Gardens, with some lovely blooms; second, Mr. W. Shropshire, Cheswardine Marsh; third, E. Amies, Esq. (gardener, Mr. S. Marshall), Fairholme, Surrey. The competition in this class was very keen, and a splendid display resulted.

DAHLIAS.

Mr. William Tresseder, Cardiff, was first for a general collection with a fine display; second, Messrs. Keynes, Williams and Co., Salisbury; third, Messrs. Jones and Sons, Shrewsbury.

The Cactus Dahlias made a grand show, Mr. Rowe, Barbourne Nurseries, Worcester, leading easily for a collection. Mrs. Mawley, Harry Lang, and Maid of Honour were conspicuous; Mr. S. Mortimer, second, had grand flowers without any foliage, and Messrs. Keynes, Williams and Co. third.

Twenty-four blooms, show varieties: First, Messrs. Keynes, Williams and Co., Salisbury, with some fine flowers; Mr. S. Mortimer, Farnham, Surrey, was second with hardly less good blooms; Mr. J. R. Tranker, Henley-on-Thames, third.

Twelve show Dahlias (nurserymen excluded): First, Mr. T. Jones, Penylan, Ruabon, with large well formed flowers; second, Mr. J. Davis, gardener to W. E. King, Esq., Bodenham; third, Mr. W. Hutchinson, Kirbymoorside.

Twelve varieties Cactus Dahlias: First, The Vineries, Limited, Acocok's Green, with a splendid lot; second, Messrs. Keynes, Williams and Co., Salisbury.

Twelve varieties Cactus Dahlias (nurserymen excluded): First, Mr. J. Davis, Bodenham; second, Mr. G. Banfield, gardener to W. H. Banks, Esq., Kingston.

Six varieties Cactus Dahlias (nurserymen excluded): First, Mr. J. Davis; second, Mr. J. Taylor, Hardwicke Grange Gardens; third, Mr. J. Birch, Shotton Hall Gardens, Shrewsbury.

ROSES.

These, for the season, were remarkably fine, possibly the best display ever seen at this exhibition.

Twenty-four blooms: Messrs. R. Harkness and Co., Hitchin, had the premier stand with large fresh blooms; the best varieties were Paul Neron, Bessie Brown, Etienne Levet, Mrs. John Laing, Mme. E. Verdier, White M. Cochet, Charles Lefebvre, Ed. André, Maman Cochet, Gustave Piganeau, and Her Majesty; second, Messrs. D. and W. Croll, Dundee, Comte Raimbaud, Louis van Houtte, and Liberty being excellent; third, Messrs. Perkins and Son, Coventry.

Twelve blooms (county of Salop): First, Mr. S. J. Simon, Market Drayton, with fair blooms but badly arranged; the best flowers were Mme. Lambert, Liberty, White Maman Cochet; second, Rev. J. T. B. Wollaston; third, Mr. J. H. Stacey.

GREAT SALE

NOW ON

Twenty-four blooms, not less than twelve varieties (amateurs): First, R. F. Hobbs, Esq., Worcester, with a fresh lot of fair blooms, the light ones being most strongly represented; the best were Mildred Grant, The Bride, A. K. Williams, Her Majesty; second, Mr. J. W. Hinton, Stafford, with smaller blooms; third, Mr. H. Hawterworth.

Eighteen blooms, not less than twelve varieties (amateurs): First, R. F. Hobbs, Esq., Worcester, with a very fine lot of good substance; second, W. Hutchinson, Esq.; third, H. Hawterworth, Esq., with a stand of great merit; no less than eight exhibits were staged.

OTHER HARDY FLOWERS.

Collection of Carnations: The first prize lot was a splendid arrangement from Mr. A. F. Dutton, Bexley Heath; second, Mr. M. Campbell, Blantyre; a splendid third, Mr. Watte, St. Asaph, many thought he should have been second.

For a collection of hardy perennials to cover a frontage of 15 square feet, Messrs. Harkness and Sons, Bedale, Yorks, staged a gorgeous group. Heavy masses of rich colour, for instance, Gladioli Lafayette, Delilah, and Marie Lemoine, Montbretia rosea, exquisite; Lilliums in profusion, and Trollius Fortunei. Mr. Prichard, Christchurch, was a good second, but his display lacked colour and weight. Messrs. Gibson, Leeming Bar, Bedale, were a good third.

Gladioli were not very strongly shown. Messrs. R. Hartland and Son, Cork, won in grand form for thirty-six spikes, the Childs type figuring prominently. Messrs. R. Harkness and Prichard were second and third.

For twelve spikes of Gladioli, Mr. W. Hutchinson, Kirbymoorside, was first.

The twenty-four bunches of hardy flowers (shrubs and annuals excluded) made a grand class, Miss Humberston, Chester (gardener, Mr. R. Wakefield), leading in grand style from Messrs. Gibson, Leeming Bar. Phlox Frau S. Buchner, Lobelia Fire Fly, Echinops ruthenicus, and Scabiosa caucasica were especially fine.

VEGETABLES.

These if anything were finer than ever, showing what can be done by capable growers in a most adverse season. In the special class for nine kinds (the prizes being given by Messrs. James Carter and Co.) Mr. E. Beckett, gardener to Lord Aldenham, Elstree, staged the premier lot with grand Leeks Holborn Model, Cauliflower Carter's Early Autumn Giant, Celery Solid Ivory, Potato Windsor Castle, Onion Selected Ailsa Craig, &c.; second, Mr. D. Gibson, gardener to Mr. Johnstone; third, Mr. B. Ashton, gardener to the Right Hon. Earl of Lathom.

Collection of vegetables, nine distinct kinds (prizes presented by Messrs. Sutton and Sons, Reading): First, Mr. J. Gibson, gardener to R. W. Hudson, Esq., Marlow, with splendid Leek Sutton's Prizetaker, Cauliflower Autumn Mammoth, Tomato Perfection, Runner Bean Beet of All, Onion Ailsa Craig (very fine), Potato Windsor Castle, Pea The Gladstone, &c.; second, Mr. E. Beckett, with extra fine Peas, Cauliflowers, and Runner Beans; third, Mr. B. Ashton, with a good lot.

Collection of vegetables (prizes presented by Messrs. Hewitt and Co.): First, Mr. J. Read; second, Mr. E. Walker.

Collection of vegetables, eight distinct kinds (prizes offered by Messrs. Webb and Sons): First, Mr. B. Ashton, Ormskirk Gardens, with a display of excellent quality; second, Mr. W. L. Bastin, Buscot Park Gardens, Faringdon; third, Mr. H. Folkes, gardener to the Right Hon. T. J. Halsey, M.P., Hempstead, Herts. Mr. J. Weston won the first prize offered by Messrs. Webb for a dish of Tomatoes with Webb's Sensation: Mr. W. L. Bastin was second, and Mr. B. Ashton third.

Mr. R. C. Townsend, Chalfont Park Gardens, Slough, was first for Mr. E. Murrell's prize for eight distinct kinds of vegetables; Mr. J. Birch, Shotton Hall Gardens, was second; Mr. E. Walker, gardener to Sir W. Honyman, Bart., third.

Six distinct kinds (prizes by Mr. E. Murrell): First, Mr. J. Clowes, Hadnall Hall Gardens;

second, Mr. J. Abbott, gardener to Mrs. Guise, Hadnall; third, Mr. D. Breeze, 55, Percy Street.

Nine distinct kinds (prizes by Messrs. Richard Smith and Co., Worcester): First, Mr. R. A. Horspool, Ruabon; second, Mr. E. Beckett, Aldenham House Gardens; third, Mr. S. Bremmell.

Special prizes offered by Mr. R. Sydenham: His fifteen guinea silver challenge cup was won for the third time by Mr. W. Leith, gardener to Colonel O. R. Middleton, Ross, and thus becomes his property. Two dishes of Peas: First, Mr. R. A. Horspool, Ruabon, with Gladstone and Duke of Albany; second, Mr. J. Read; third, Mr. W. Leith. One dish Runner Beans: First, Mr. W. Leith, with very fine Ne Plus Ultra; second, Mr. R. A. Horspool; third, Mr. G. Davies. Three Cauliflowers: First, Mr. J. Read, with Model; second, Mr. W. Leith; third, Mr. H. Folkes. Six Carrots: First, Mr. H. Folkes, with Scarlet Intermediate; second, Mr. W. Leith. Six Parsnips: First, Mr. W. Leith; second, Major Clive; third, Mr. F. C. Clark. Mr. Sydenham offered prizes in several more classes.

Collection of vegetables, nine kinds: First, Mr. J. Hay, gardener to Captain Cecil Hunt; second, Mr. J. Bush, gardener to Captain Butler; third, Mr. J. Delamere, gardener to the Rev. E. M. Furley.

Collection of vegetables, twelve kinds: First, Mr. James Gibson, with very fine Onions Ailsa Craig, Cauliflowers, Carrots, and Leeks; second, Mr. E. Beckett; third, Mr. B. Ashton.

NON-COMPETITIVE EXHIBITS.

Messrs. Dobbie and Co., Rothesay, made a grand display with Dahlias, chiefly Cactus and Pompon, Pansy blooms, and a fine collection of Potatoes in baskets. Large gold medal.

Messrs. Wm. Cutbush and Son, Highgate, N. had a miscellaneous display of hardy herbaceous flowers, a miniature rockery of alpine, &c. Silver-gilt medal.

The Ranelagh Nurseries Company, Leamington, showed a good group of Asparagus myriocladus. Small gold medal.

A most interesting collection of Oranges and Lemons was exhibited by Mr. R. Milner, gardener to Miss Talbot, Margam Park, Port Talbot. Silver medal.

Mr. Myers, Sutton Lane Nursery, Shrewsbury, made a very bright display with zonal Pelargoniums effectively arranged. Small gold medal.

Messrs. Dicksons, Chester, exhibited a bank of Phloxes, Delphiniums, Poppies, Lilies, &c., and also a group of stove plants, making altogether a notable display. Small gold medal.

Mr. F. Bouskell, Market Bosworth, showed a miscellaneous collection of hardy herbaceous flowers in great variety. Silver-gilt medal.

Messrs. Hewitt and Co., Solihull and Birmingham, had a bright array of hardy flowers, boldly and effectively arranged. Silver-gilt medal.

Mr. W. B. Child, Acock's Green, made a good display with hardy herbaceous flowers set up in large bunches. Small gold medal.

Messrs. J. Backhouse and Son, York, had a miniature rockery of alpine that contained many choice things. Silver medal.

Mr. Edwin Murrell, Portland Nurseries, Shrewsbury, exhibited Roses well, both in vases and in boxes. Small gold medal.

Messrs. William Bull and Sons, King's Road, Chelsea, S.W., showed a very choice group of ornamental-leaved stove plants. Silver medal.

Captain Holford, Westonbirt, Tetbury, Gloucestershire (gardener, Mr. Chapman), exhibited some of his famous Amaryllis. A remarkable display so late in the season. Large gold medal.

Pentstemons, Phloxes, Stocks, and Carnations were finely shown by Mr. John Forbes, Hawick. Silver-gilt medal.

Messrs. Sutton and Sons, Reading, had a grand display of Gloxinias in many lovely varieties. These were arranged upon a low staging so that one could see them to the best advantage. Arranged among Ferns and other small decorative plants they were very effective. Some crested forms of the tuberous Begonias were also shown. Large gold medal.

Fruit trees in pots were finely shown by Messrs. T. Rivers and Son, Sawbridgeworth. The Peach and Nectarine trees were loaded with fruits, and apart from their economic value made really effective decorative plants. Vines, Cherries, Apples, Apricots, and Plums were all well shown growing in pots. Among the best Peaches were Champion, the new Peregrine (award of merit, Royal Horticultural Society, last Tuesday), Crimson Galande, while Nectarines Milton and Dryden, and Cherries Late Duke and Emperor Francis were fine. Large gold medal.

Mr. T. R. Hayes, Keswick, Cumberland, had a good display of Heaths, making an unusual and interesting exhibit. Menziesia polifolia alba was very pretty. Romneya Coulteri and Scolopendrium crispum majus were finely shown too. Silver-gilt medal.

Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath, showed tuberous Begonias very finely. Small gold medal.

Messrs. B. R. Davis, Yeovil, also exhibited some very good tuberous Begonias. Silver-gilt medal.

Messrs. Richard Smith and Co., Worcester, had a very attractive group of miscellaneous hardy flowers in great variety. The Campanulas, Lilies, Gladioli, Clematis, Phloxes, and Rudbeckias were particularly good. Small gold medal.

Mr. H. Deveril, Banbury, showed zonal Pelargoniums and hardy flowers. Silver-gilt medal.

Messrs. Gunn and Sons, Olton, Birmingham, showed hardy flowers in good variety. Silver medal.

Mr. John Russell, Richmond, exhibited a group of ornamental-leaved stove plants, that contained many good Alocasias, Crotons, &c. Small gold medal.

Ferns and table plants were well shown by Messrs. Pritchard and Sons, Shrewsbury.

Messrs. John Peed and Sons, West Norwood, S.E., exhibited an excellent group of Caladium in some distinct and bright colours. Small gold medal.

Messrs. Laing and Mather, Kelso-on-Tweed, showed a lovely lot of Carnations. Some of the varieties were very fine, distinct, and of rich colouring. Silver medal.

Mr. J. H. White, Worcester, exhibited hardy flowers in great variety. Silver-gilt medal.

Mr. H. Eckford, Wem, had a splendid display of Sweet Peas. Silver-gilt medal.

Messrs. Clibran, Altrincham, showed hardy flowers—Carnations, Sweet Peas, &c.—in great variety. Silver-gilt medal.

Double St. Brigid Anemones were finely shown by Messrs. Reamsbottom and Co., Alderborough Nursery, Geashill, King's County, Ireland. They made a pretty and unique display. Silver-gilt medal.

Hobbies, Limited, Dereham, exhibited Dahlias and Roses in quantity and great variety, making a bright display. Large gold medal.

Messrs. W. and J. Brown, Peterborough and Grantham, showed a bright miscellaneous group of flowers. Silver medal.

Dahlias in great variety and quantity, Begonias, Phloxes, Pelargoniums, and Potatoes were exhibited by Messrs. Jarman and Co., Chard. Small gold medal.

AWARDS.

First-class certificates were given to Cactus Dahlias Brightness (Mortimer), Lucifer (Dobbie); Hippeastrums Guiding Star and Meteor (Captain Holford); Senecio divorum and Astilbe Davidii (J. Veitch).

Awards of merit were granted to Chrysanthemum maximum King Edward VII. Angus, Penicuik; Carnation Aglaia (Bouskell), Cactus Dahlias Golden Drop and Shrewsbury (Mortimer), Chrysanthemum maximum x leucanthemum (Bouskell), Hippeastrums Vesta and Draconis (Captain Holford), Carnation Queen (Lambert, Southport), Carnations Mrs. Nicholson and Gladys (Aldersey).

THE GARDEN

No. 1658.—Vol. LXIV.]

[AUGUST 29, 1903.]

THE FLORIST v. GARDEN HOLLYHOCK.

SO much interest has been aroused in this noble garden flower through the paper given by the well-known grower, Mr. Webb of Saffron Walden, at the last meeting of the Royal Horticultural Society, that it will be interesting to criticise the flowers that the florist delights to praise and those considered of the best effect in the garden. On the following page two illustrations are given, one showing a florist's flower and the other a garden variety with broad guard petals. There can be no doubt whatever that the florist's Hollyhock, from the point of view of beauty, is much too round and tight and full of petals. In many cases also the spike is too much crowded with bloom. Of course, no one wants a thin or empty spike in a garden Hollyhock. There is just a point where the most supreme beauty of which the plant is capable culminates, both in the fulness of the spike and in the fulness of the individual bloom. In obedience to a false ideal, the florist's Hollyhock has been pushed beyond this point, and is no longer so good a thing in a garden as many a chance seedling that has no claim to good breeding.

In the show flower the petals are too much crowded, and the whole flower too round and ball-like. Beauty in a garden flower is better than tightness or even than rotundity.

This case of the Hollyhock is only one of many in which the influence of the show is unhelpful, even if not harmful, to garden progress. But surely the Hollyhock is, above all things, a garden flower. We feel quite sure that growers will be only consulting their best business interests if they would give attention to producing the kind of flowers that are now wanted. Any grower who could be the first to establish a strain of plants answering to the present needs would be astonished at the healthy demand for the plants that would ensue.

What is wanted is a wide flower with a large and distinct guard petal, and that the mass of petals in the middle of the flower should not be so closely packed as to prevent the play of light and shade, or hide its wonderful effect of the value of the colour. This play of colour in the shaded depths of the flower adds materially to its brilliancy; when it is shut out by the closely-folded packing of the inner petals one of the most charming of its beauties is entirely lost, and an important source of

brightness when seen at a little distance is destroyed.

The favourable exception mentioned above was in the case of a flower of deep and pure sulphur colour, whose looser centre and distinct guard petal made the bloom stand out among its fellows as a thing of rare and refined beauty.

The following notes from Mr. Richard Dean concerns chiefly the florist's Hollyhock. We should be glad to hear from readers who have been successful with the Hollyhock as a garden flower as to the means this success is attained, soil, position, and so forth.

There can be no doubt as to the importance of the place that these grand plants have in our gardens. Their great stature, monumental aspect, and beauty of varied colouring entitles them to the most careful consideration we can possibly give, and though they are already extremely popular plants and widely grown, we should like to see them even better treated.

The scourge of the Hollyhock fungus which attacks so many plants of the Mallow family has of late years deterred many from growing them. No one can suffer more from this than the present writer, in whose garden, on dry, sandy soil, the pest is rampant, and Hollyhocks cannot be grown to anything like perfection. Still they can be grown to a certain degree by means of strong feeding, and though when the spike is in flower the lower leaves are lost, there is still the grand bloom. In this case they are placed so that they rise among other plants and the defect at the base is not seen.

We are informed by a nurseryman who grows these fine plants largely that growing them in a quite open place, where the early leaves get hardened by exposure to sun and air, is a safeguard against disease; still, in garden use, such a place cannot always be given.

It is much to be wished that some nurseryman or patient amateur who lives upon the cool loamy soil where the pest does not thrive would take in hand the raising of these grand plants in the form that is the most beautiful for gardens.

"With the revival of interest in that old florist's flower, the Verbena, there is also forthcoming evidence that the Hollyhock is also rising in the estimation of the flower-loving public. This was shown by the remarkable collection of fine double varieties exhibited by Messrs. Webb and Brand, who succeeded to the business carried on by the veteran William Chater at Saffron Walden for many years, a florist who took up the work of improving the Hollyhock at a point when it was dropped by Charles Baron, the working man florist,

who was the pioneer of its early development from a single form.

"Perhaps no finer spikes of Hollyhocks were ever seen than those produced by William Chater and the Rev. Edward Hawke, afterwards Lord Hawke, whose son and successor to the title is the present captain of the celebrated Yorkshire cricket team, when these two used to compete against each other at Bishop Auckland and other places thirty years ago, exhibiting spikes of very fine double flowers 3 feet to 4 feet in length, and perfectly symmetrical. Then followed the ravages made by the fungus and the destruction worked among collections. It fell to the melancholy lot of William Chater in his old age to witness the almost or quite entire loss of varieties of high quality he had the good fortune to raise, losing them when the deadly action of the fungus was at its height. I used to make an annual visit to the veteran, and the manner in which he sorrowed over losses he could not prevent was pitiable to see. He attempted many expedients to ward off the disastrous effects of the fungus, and, previous to his death, fortunately witnessed considerable mitigation of its disastrous effects. His successors, Messrs. Webb and Brand, by dint of most painstaking culture, have gradually built up a fine collection, including some of Chater's varieties, which were happily saved from entire destruction, and also some varieties they have been able to raise. It is also satisfactory to know that there is a growing demand for the best double varieties of this stately plant.

"The collection staged by Messrs. Webb and Brand included eighteen spikes, which formed a background to six boards of cut blooms, each board containing twenty-four flowers, all of excellent quality. Unfortunately for the value of this collection as an object-lesson, none of the varieties were named, but among them were such leading sorts as Alba superba, pure white; Amaranth, deep amaranth pink, extra fine; Black Knight, improved, a distinct shade of shining black, probably the best of the dark varieties, and a colour the most difficult to get in association with the finest symmetry; Carus Chater, deep glowing crimson, a large, full variety, which forms a very fine spike; Crimson King, intense deep crimson, and probably the deepest of that shade of colour; Exultium, glossy maroon; Fire King, bright red, a large full flower of excellent form; Heliotrope, shaded heliotrope, of a peculiar tint of colour, and affording desirable variety; James Allen, deep claret, fine in colour, and most distinct; Miss Lizzie King, clear yellow, forms a fine spike; Mrs. Bailey, delicate shade of flesh, large, and striking in the spike; Olivia Chater, delicate flesh, with a surface of white, quite distinct; Ovid, a charming rose-tinted flower; Primrose Gem, soft primrose, with a tint of carmine; Princess, rosy pink, suffused with buff, pretty and distinct; Purity, salmon, flesh shaded at the base of the petals; Rose Queen, silvery rose, small in size, but very pleasing; Ruby Queen, rich ruby crimson; and Victor, crimson-scarlet, with a sheen of buff, a large, bold flower of fine character.

"Hollyhocks can be planted out either in the autumn or spring, but unless the soil in position on which the plants are to be grown are favourable—the soil fairly well drained, and the position a slightly elevated one—it would be well to pot the plants, keep them in a cold frame during the

FLORIST'S HOLLYHOCK. (Reduced.)

winter, and plant out early in April. But fine Hollyhocks can be produced only in a richly manured soil, the plant being a somewhat gross feeder. It is therefore customary to deeply trench the ground the plants are to occupy, working in a quantity of well-rotted manure. In hot and drying weather surface mulchings with manure are of great value, thus keeping the surface of the soil cool and moist, and also acting as a fertiliser. Plants which have bloomed are helped through the winter by placing a surface of cinder ashes or coarse sand round the stem, so that water may be drained away from the hearts of the plants, which would otherwise do them injury." R. DEAN.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 1 and 2.—National Dahlia Society (two days); Meeting of the Committees of the Royal Horticultural Society on the first day. Both exhibitions at the Drill Hall, Westminster.

September 9.—Great Autumn Show of Royal Caledonian Horticultural Society (two days). This show is held in Edinburgh; Dahlia Show at York.

September 11.—Manchester Dahlia Show.

September 15.—National Dahlia Society (Committee Meeting); Royal Horticultural Society (Meeting of Committees), twelve noon.

September 16.—Hull (two days).

September 29.—Royal Horticultural Society and Conference at Chiswick (three days); Gardeners' Dinner, Holborn Restaurant, six o'clock.

Improvement of the Heuchera.—Your correspondent G. Mallett, in his description of the Heuchera, in describing Robusta and Walker's variety mentions them as being pale coloured forms. This is very misleading. Walker's variety is one of the brightest I have yet seen, with exceptionally large individual flowers; in fact, it is the nearest approach to the original plant introduced by me from Mexico that I have yet seen.—AMOS PERRY, *Winchmore Hill, London, N.*

Royal Horticultural Society.—This society will hold a special exhibition of Dahlias on September 1 and 2, in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, Westminster. At this meeting (unless by special arrangement and permission) only Dahlias can be shown, with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 6 p.m. on the second day. A lecture on "Judging Cactus Dahlias" will be given on September 1 by Mr. C. G. Wyatt at three o'clock. At a general meeting of the society held on Tuesday, the 18th inst., twenty-five new Fellows were elected, among them being the Right Hon. Sir Francis H. Jeune, G.C.B., Colonel T. H. Skinner, and Dr. A. Henry, making a total of 1,095 elected since the beginning of the present year. Intending exhibitors at the fruit and vegetable show, to be held at Chiswick on September 29, 30, and October 1, can obtain an official entry form, together with schedule

of prizes, on application to the Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W. Entries for this show close on September 22. There will be a special tent for horticultural sundries. A cold luncheon will be provided on September 29, at which the council, judges, and the committees will be present, and for which all interested in the show can obtain tickets (3s., including wine or beer), on application to the Secretary, 117, Victoria Street, S.W., before September 27.

The season's fruit crops.—When such an authority as Mr. G. Bunyard describes the present fruit season as the worst he can remember, it may be taken for granted that things are generally bad. How bad they are no one realises more than the little market grower who is dependent for a living on his orchards and plantations, and amongst this worthy class of men there are some whose financial foundations will be sorely shaken this year. Amid the story of general disaster the small fruits, such as Currants, Gooseberries, Strawberries, and Raspberries are the redeeming feature, for even if some of these have not been quite up to the average, the high prices obtained have compensated for any shortage. Many Black Currant growers have had to be satisfied with half a crop, but with the wholesale price at 24s. a bushel, they did something to compensate for losses in other directions.—H.

Physianthus albens.—A plant of this old greenhouse creeper, trained to a balloon-shaped trellis, and well grown and bloomed, was shown among the specimen greenhouse plants seen at the recent Taunton Deane flower show. It was introduced from Brazil in 1830; it is evergreen; its common name is the White Bladder Flower, referring to the bladder-shaped blossoms, which are creamy white and freely produced. It is a subject which can be occasionally met with trained to the rafters of a greenhouse or against a back wall. It is most at home when planted out in a greenhouse, the warmth of such a house sufficing to keep the plants in good health during autumn and winter. A compost of peat, rotten manure, and some sand suits it. It is said that the plant will live for many years if top-dressed in spring with new soil, and assisted through the growing season with manure water. It is always interesting to see an old plant produced in such fine character as it was at Taunton.—R. DEAN.

Gardening at Earl's Court Exhibition.—In the western gardens attached to this popular place of resort a praiseworthy attempt has been made this season by planting some beds of old English flowers—sweet-scented Stocks, Mignonette, Carnations, Sweet Williams, herbaceous Phloxes, Pentstemons, stately Delphiniums and Hollyhocks, Campanula pyramidalis, blue and white, Lobelia cardinalis, a striking picture by reason of its vivid scarlet flowers admirably contrasting with its well-known dark foliage, scarlet Nasturtiums, &c. It would be well to repeat this old English garden idea at Earl's Court next year, and on a much extended scale. It is but bare justice to mention that the western gardens have this year, for the first time, been tastefully furnished by Mr. George M. Bick, F.R.H.S., of Shortlands, Kent.—Quo.

The Gardeners' Dinner and Reception.—As we are fast approaching the date of this much-looked-for gathering, September 29, kindly permit me to remind all those who may purpose being present at what will undoubtedly be a unique gardening function, that they should waste no time in securing tickets, as they are fast being issued. We have been compelled to set a limit to their number. Many friends will be much gratified to learn that our famous rosarian, the Rev. Dean Hole, has secured a ticket and hopes to be present to greet his many brothers in horti-

culture, as also to support our very estimable chairman, Mr. Leopold de Rothschild. Many others famous in gardening will be present. It does seem as if the show at Chiswick might be the last held there. In any case no other such opportunity to see the old garden as the show presents may again exist. Many gardeners may find gathered at the dinner friends from distant parts whom they may never see again. Applications should be made direct to me at 62, Richmond Road, Kingston-on-Thames.—ALEX. DEAN, *Hon. Secretary.*

Begonia Lafayette.—A correspondent, "T.E.," in referring to this very beautiful Begonia, suggests that as it is not a robust grower it must be planted thickly to produce a good bedding effect. That is just the common mistake made in planting Begonias as summer bedders. If the writer could see the large oblong bed near the river front at Hampton Court, planted with this superb double-flowered Begonia, the plants some 20 inches to 24 inches apart, and each one some 15 inches to 16 inches across and laden with flowers, he would realise that the variety was robust, and planted singly thus on a silvery carpet gave the finest effect any similar plant possibly could. Mr. Gardiner, the able superintendent there, told me that what "T.E." had said was a general opinion, but it was wrong. He sets his tubers to start slowly on Cocoa fibre refuse in a moderate heat, then transfers them into pots, and when well rooted stands them in a cold frame to harden, so that the leaves will withstand exposure when bedded out early in June.

Single Hollyhocks.—I entirely concur with Mr. Jenkins in his references to Mr. Webb's paper on the Hollyhock, read at the last Drill Hall meeting. The views expressed were entirely those of the hard and fast florist. The class of bloom favoured by the paper was exemplified in the hall then, solid round formal flowers, no doubt all that a stiff florist would admire, but were far too formal for me. There was also a lack of colour variety, whereas in the beautiful singles we see colours singularly varied and very beautiful. I have often thought that if these were not allowed to carry a tall central spike, but had it stopped when half grown, so as to induce several strong side stems to be produced, that the floral effect would be much enhanced. But even if doubles, though less formal and solid than were the Saffron Walden flowers, what capital ones can be got by sowing seed annually, thus saving all the trouble of propagating by cutting or grafting, so fully referred to in Mr. Webb's paper. Myriads of grand spikes of bloom raised from seed may be seen yearly now. The single varieties are very beautiful, and seem less prone to disease than the doubles.—A. D.

Sedum spectabile for butterflies.—As an observer of insect life for many years, I can fully endorse all that has been said by former

GARDEN HOLLYHOCK (SHOWING BROAD GUARD PETALS). (Reduced.)

contributors about *Sedum spectabile* having a great attraction for butterflies of many kinds. For moths the Red Valerian seems to be a great favourite. The small Elephant Hawk Moth is often to be seen hovering over patches of it, and many other moths as well. I may mention that at Drumlanrig Castle, in the year 1846, *Enothena taraxicifolia* was very extensively planted in the flower garden, and during the autumn evenings it was visited by hundreds of the Convulvulus Hawk Moth. Since that time I have only seen one solitary specimen, and that three years ago. — JOHN MATHEWSON, *The Gardens, Addington, Winslow.*

A flower show destroyed.—A curious accident occurred at Chirk, North Wales, on Saturday afternoon, the 15th inst. Two spacious marquees had been erected for the annual show of the Horticultural Society, and when the judges had almost completed their work the largest tent, in which some thirty persons were assembled, suddenly collapsed with a fearful smash. Several persons had narrow escapes from falling poles, and the floral exhibits were almost completely destroyed.

Mr. T. Humphreys.—We are pleased to know that a testimonial is to be presented to Mr. Thos. Humphreys, the new curator of the Birmingham Botanic Gardens, on his departure to that post from the Royal Horticultural Society. It is being confined practically to the members of the committees of the society, but there is no reason why anyone who feels so inclined should not also contribute. Subscriptions should be sent either to Mr. H. B. May, Dyson's Lane Nursery, Edmonton, or to Mr. R. Dean, Ranelagh Road, Ealing; the former is the chairman of a small committee, and the latter the secretary.

Tufted Pansy Queen of the Year. This is one of the best of the pretty miniature or Violetta type. My plants were pulled to pieces in the early spring and replanted at once. The divided pieces are now little tufts of miniature pale china blue flowers, with a small white centre; they are also sweet scented. This variety was raised by the late Dr. Chas. Stuart, who gave us so many good things. This and others of the same type are very suitable for the rock garden, and are unrivalled for their display, which begins rather later than the large-flowered sorts.

The Fuchsia as a bedding plant. The Fuchsias have always been regarded as moisture-loving plants, and if proof of this were needed the display made in several of the more conspicuous beds at Aldenham House should be convincing. The summer of 1903 is abnormal, but for all its unpleasantness it is encouraging to note those things that have done well under the circumstances. Among the many beds in this fine garden those planted with the Fuchsia are certainly the most interesting. Large and small beds are devoted to Fuchsias, and they are very striking. One variety more conspicuous than the others was *Lye's Favourite*, this being represented in a large bed by freely-flowered plants of a good size. One would have thought that the inclement weather of late would have rendered the display of little effect, yet this was one of the most attractive.

Calceolaria amplexicaulis.—The flower-beds in the gardens of Aldenham House are generally filled in a way quite different to that which prevails in most establishments, and on the occasion of a recent visit one of the most pleasing examples of Mr. Edwin Beckett's skill in this direction was a bed planted with *Calceolaria amplexicaulis*. The soft green leaves clasping the stems and the free display of lemon-yellow flowers made a pleasing contrast to a carpeting of a variegated form of *Alyssum maritimum*. Notwithstanding the excessive and continuous rainfall and the recent boisterous winds, this *Calceolaria* has not suffered. —D. B. C.

New Black Currant Boskoop Giant.—For years the older varieties of Black Currant have not been satisfactory, owing to the attacks of the mite, and this in spite of more attention to culture, such as cutting down infested trees and getting new growth. To secure a full crop we recently tried the newer introductions,

and the one named above is certainly the most valuable. So far it has been free from the pest, and promises, when the trees are larger, to be a great cropper and very free grower. In addition to its free growth, it bears very fine bunches (long and handsome) of berries; indeed, the largest I have seen of any Black Currant, while the flavour is rich. It is one of the best for tarts or preserving. There can be no doubt that the Boskoop is a decided acquisition, and well worth attention by those whose trees have been attacked by the mite. In any case it is desirable to give the trees new quarters, and as far away as possible from the older ones if at all diseased. Owing to its quick growth it soon attains fruiting size, and ample space should be given on this account. A large grower of small fruits told me recently that he considered the Boskoop Giant by far the best Black Currant grown. He was growing it largely. —S. M.

Imports of fruit and vegetables.—It is interesting to compare the imports of fruit and vegetables in July with those of the corresponding month of the two preceding years. They are as follows:

	1901.	1902.	1903.
Potatoes cwt.	784,384	1,169,294	1,047,235
Tomatoes	180,535	104,182	227,361
Onions bush.	485,996	615,319	634,190
Unenumerated vegetables	£34,735	£37,041	£33,564
Apples cwt.	48,913	35,786	80,147
Apricots and Peaches	8,325	8,461	5,810
Cherries	77,590	53,274	46,684
Currants	59,944	58,990	57,311
Gooseberries	6,516	13,089	18,130
Grapes	24,300	12,250	18,355
Pears	44,314	5,867	12,323
Plums	60,410	36,651	30,638
Strawberries	7,023	15,549	5,001
Unenumerated fruit	159,968	83,172	152,673

A few fruit notes from Ireland.—In this north-midland county in Ireland the Apple crop has been a complete failure. I was lately through an orchard district, and I did not see half-a-dozen Apples in the whole country-side. Whether there was a good bloom or not I cannot say. It is the same in all my neighbours' gardens —no Apples at all. I myself have been rather more fortunate; I have about a quarter crop. I had an excellent bloom and set, but most of the crop fell, mostly when the fruit was the size of large Walnuts. I have a full crop of *Glory of England*, *Cox's Pomona*, *Small's Admirable*, *Dumelow Seedling*, *Old Northern Greening*, *New Northern Greening*, *Lane's Prince Albert*, *Ashmead Kernel*, and *Worcester Pearmain*; and a sprinkling more or less of *Bismarck*, *Bramley*, *French Codlin*, *Lady Henniker*, *Irish Peach*, *Clarke's Seedling*, *Reinette van Mons*, and *Red Juneating*. *Cox's Orange Pippin* is bearing well, but it is against a wall. As a standard here the fruit cracks and cankers. I never recollect such a fall of Apples when quite large. My usual sheet-anchor, *Hanwell's Sowing*, has played me false this year—no crop—which is a heavy loss. I note what Mr. Crook says in THE GARDEN about *Strawberry Loxford Hall*. When I first got it, about fourteen years ago, it did very well, but has gradually been deteriorating, and now hardly grows or bears at all, and I have the same to say of *Marshal McMahon* and *Sensation*. This last bore enormously at first, but now all goes to leaves and gives no return. Messrs. Laxton's newer variety (*Fillbasket*) had a huge crop this year, but it was wanting in flavour. This may be owing to the extreme wet of the season. *Trafalgar* has much disappointed me; here it has no pretension to be a late Strawberry. It is too soon to pronounce an opinion of *The Laxton*, but so far I see no improvement in it on *Royal Sovereign*, except that it is a rather better colour. I had my first dish of *Strawberries* (*Black Prince*) this year on June 23, and my latest on August 11 (*Helen Glade*). Can anyone recommend a really later variety than this? —D. K., *County Cavan.*

Carnations at Far Forest Vicarage. I noticed some superb masses of these flowers in the Rev. G. F. Eyre's garden on the 12th inst. Soil and situation, as well as careful cultivation, were all undoubtedly in their favour, and I failed to discover a weakly or diseased plant. For bedding purposes Mr. Eyre employs only four varieties, these being *Germania*, *Ladas*, *Miss Audrey Camp-*

bell, and *Duchess of Fife*. Quite the most free-blooming was the first-named, and I should imagine it would be difficult to find a yellow variety to excel it when grown as well as it is at the Far Forest. *Duchess of Fife* was also very good, and the colour of the flowers—a delightful shade of pink—gives a very good effect in a mass. —ARTHUR R. GOODWIN.

Presentation.—An interesting event took place at the summer show of the Bishop's Stortford Horticultural Society, which was held on Wednesday, the 12th inst., in the grounds of The Grange, Bishop's Stortford, by permission of Mr. John Barker, J.P. It was a presentation to Mr. William Smith (late hon. secretary) of his portrait in oils in appreciation of the admirable way he has carried out the duties since the formation of the society in 1870. The presentation was made on the terrace at The Grange by Mr. Treham Gilbey, the president for the year, in the presence of a large and distinguished party of visitors. The president remarked that since the society was started it had seen its ups and downs, but in Mr. Smith they had had the right man at the helm, and the show was now the best within sixty miles of London. This was entirely due to the energy and unfailing pluck of their late hon. secretary. Sir Walter Gilbey and Mr. John Barker endorsed these remarks, and Mr. Smith in reply said the fortunate position he was in was quite as much due to force of circumstances as to his own merit. At the time the show was started there was a great want of it in the neighbourhood, and the hearty way in which it had been supported had made it an easy task for him. He did not think he deserved such recognition, more especially after the handsome present of a gold watch and chain given him on completing twenty-one years' service. The show this year was one of the most successful the society has ever held. Among the principal prize-winners were Colonel Archer-Houblon, Sir James Blyth, Bart., Messrs. John Barker, R. C. Gosling, John Balfour, Felix Calvert, Charles Gold, Charles Gold, jun., M. Taylor, C. J. Hegan, &c.; while complimentary exhibits were sent by Messrs. Paul and Son, Cheahunt; Messrs. T. Rivers and Son, Sawbridge-worth; Mr. Amos Perry, Winchmore Hill; Mr. H. C. Pulham, Elsenham, Essex; Messrs. G. E. Swarder and Sons, Bishop's Stortford; Messrs. T. S. Ware, Limited, Feltham; Mr. S. Mortimer, Farnham; and Mr. W. Stacey, Dunmow.

TOWN GARDENING.

"The world is full of honey-bees, the world is full of Roses,
And all the world's a garden, with summer to and fro."

EVEN sun-spot summers cheer up as we near July; draughts from the great big furnace are now less rough, flowers and trees have settled down, and towns and cities share the bounties of sweet summer time. Not only London, but all our country towns are at their fairest in July; fair as towns could never be without their growing flowers by wall and window-sill, their clustering trees, their parks, their façades green with foliage.

Lovely at all times as are leafy trees, bright flowers, and crimsoning creepers, never do they look quite so beautiful as among the grey stones and sombre buildings of our scholastic and cathedral towns. Harrow for instance, or Salisbury, or Exeter, or the many-spired and towered cities of Oxford and Cambridge. Great is the joy of contrast. Who has not felt a thrill of pleasure at the almost unearthly beauty of young leaves on the old walls of New College, Oxford, or on treading the soft, fine turf of University quads and gardens, old as the centuries, yet new with every spring?

Passing along and up the main thoroughfare of a big town like Norwich—which happens to be the last cathedral city we have seen in summer garb—how great the debt of gratitude

we feel to those who have made gardens of the many quaint old churchyards in the city's centre, who planted corners with shady trees, and covered walls with Ivy.

"No breathing man,
With a warm heart, and eye prepared to scan
Nature's clear beauty, could pass lightly by
Objects that look'd out so invitingly
From either side."

The climax of perfection is reached as we near cathedral precincts, where old-world buildings stand bathed in sunshine, breaths of music tossed from wall to wall like spray. Bosomed in leaves and flowers is every door and archway, nor are the window-sills forgotten, nor the little gardens that front each ancient dwelling, everywhere the waving of soft boughs, the sweetness of fragrant blossoms. Here bees hum, and birds are building, yet we are close to the heart of town. Other town gardens there are around an ancient pile, much more hemmed in, and even yet more welcome. We reach them through a narrow passage from the Strand.

"Flora and Law a common Temple share,
And rival Roses still contest it there."

This is a couplet the truth of which no lawyer will deny, and Londoners are just as glad of this oasis in the City's drought and dryness as are the country cousins who come to listen to the splashing of Tom Pinch's fountain, and the cooing of the Temple doves, finding, perhaps to their surprise, that not only on flower-show days, but always and on every day our London lawyers taste the sweetness of Rose and Musk and Lily. The Temple Benchers are great on flower-boxes; the deep recesses of their window-bays in spring as well as summer repeat the blues and reds and purples and yellows of the stained-glass saints and patriarchs who look down on the mailed crusaders sleeping stonily in the quiet round church.

Other English towns there are, very different from these, where July gardens, if less picturesquely placed, may give an even greater joy. I mean the garden-world of our pottery and mining towns. Miners are almost invariably good gardeners. The brawny crowd that dwell in districts honeycombed with pits, lurid with furnaces, heaped up with refuse barren as the moon, and dulled by day with sulphureous smoke, love flowers as dearly as any dainty lady, who is often much less well versed than they are in flower-lore and their practical management.

Longton, in Staffordshire, is a type. This crowded, grimy place has a park, not outside the town but right in the midst of its busy streets, where trees grow and flowers bloom, and there is a bowling green, a lake, a band-stand, and, above all, a flower show once a year, where prizes are competed for, a proof of what the Longton folk can do. Among the prize winners may be a man whose bread is earned by the turning of cups upon a wheel, or by hewing coal or ironstone in deepest depths of darkness, while we above are happy in the daylight. Such toilers as these are the men who most enjoy God's sunshine and the sight and smell of flowers, who grow them too, and love to have their houses bowered with branches of Jasmine and climbing Roses. Many of them are keen on vegetables, and experts in the growing of Celery, Cucumbers, and the Tomato. Sunday mornings are often spent happily and not unprofitably in discussing the rival schemes of culture of Petunias, Pelargoniums, and Lilies. Undismayed and undeterred by unfavourable surroundings, these busy people—through the gate of flowers—enter into the joys and share the glories of the July days, or perhaps it is the evenings that are the pleasantest, when the resting town is

wrapped in haze, and coal-smoke is forgotten in the fragrance of Geranium and "Cherry-pie."

A little bit of Nature, how good it is among the bricks and chimney-pots. Nothing need rob us of the God-sent heritage. It is ours, unless we shut it out, and the moral of it all is—bring Nature into towns. When we cannot enjoy it in its fulness let us try for it in little pieces.

"A dusty knot of fingered flowers
Recalls the breezy fields."

So wrote a poet who much loved Nature. We agree with him; and here is another text, the truth of which has been proved by many a townsman, "Do you know that the word *Paradisos* means a garden?" F. A. B.

THE MAKING OF POT-POURRI.

IN reply to "E. T.," we cannot do better than quote Miss Jekyll's remarks in "Home and Garden," page 164: "'Do tell me how you make your Pot-pourri?' is a question that comes often during the year; and it is so difficult to give a concise answer, or a short written recipe, that I will just put down all I can think of about the material and method that go to its making, in the hope that it will help others who wish to prepare the fragrant compound on their own account. And though anyone can make Pot-pourri after a fashion, yet to make it well and on rather a large scale, a good deal of care and a good deal of time are needed, besides suitable space and appliances, and a proper choice of material.

"The greater part of the bulk is of Rose petals and Sweet Geranium leaves, then in lesser quantity, Lavender, leaves of Sweet Verbena, Bay, and Rosemary, prepared Orange peel, and finally Orris-root powder, and various sweet gums and spices.

"There are of course the two kinds of Pot-pourri, the dry and the moist. The dry is much the easier and quicker to make, but is neither so sweet nor so enduring, so now the moist is the only kind I care to have. One of the chief reasons why it cannot be done by a fixed recipe is that the materials have first to be got to a certain state—limp and leathery—neither too wet nor too dry; and this state can only be secured by trying, and feeling one's way, and getting to know. When the ingredients are dried to the right degree, they are packed tightly into jars with a certain mixture of salt, which seems to combine with the remaining moisture, and serves both to retain the mass at the right degree of dampness, and also to preserve it from any kind of decay or mouldiness. In my own case, as a considerable quantity is made, I find it best to prepare a jar of each ingredient by itself, and then to mix all together; but when the whole making is small, there is no reason why it should not all go into one receptacle until the time comes for adding the spices. In the whole arrangement the matter that wants most care is the proper preparation of the Rose petals. And the Roses must be in good order. They may be full blown, but not be faded or in any way injured, and above all they must be quite dry. A Rose is a great hand at holding water. If it has been rained into when first opened, it will hold the wet in its inner depths two days afterwards. Dew does not seem to go so far in, and is generally dried by noon; but in any case it is safest to gather the Roses on a warm sunny afternoon.

"So every two or three days, when Roses are in plenty, we bring them in, perhaps a bushel-basket-full at a time. If they cannot be picked over at once, they are laid out, not more than three inches thick, on a rough hempen wrapper about three yards long by two yards wide; if they were left in the basket they would soon begin to 'heat' and spoil. The shady, paved garden court on the north side of the house is the chosen place, and the Rose-cloth is spread where the broad passage upstairs over-

hangs, so that we can sit below in shelter even in rain. Then at the earliest opportunity the Rose petals are pulled off their hard bases, and carefully sifted through the fingers so as to separate them as much as possible. Sometimes visitors are pressed into the service, sometimes the little nieces come down from their home close by, and often I go and pick them over after dark in the pleasant summer evening. It is just as easy to do without any light, and then one enjoys all the more the wonderful fragrance and the pleasant cool texture; and plunging hands or face into the mass, delicious alike to scent and touch, one calls to mind how such generous measures of plucked Roses played their part in the feasts of ancient Rome.

"The separated petals lie on the cloth for two days, or for a longer or shorter time, as the air may be more or less drying, in order that they may lose a part of their moisture; how much I cannot say, but perhaps half, as they look to be shrivelled to about half their size; and now they are ready to go into their preparation jars. After making shift for some years with various odds and ends of jars, the best of them being a big blue and grey German one and some South Italian oil jars, I had some made on purpose at Doulton's pottery. The material has to be firmly and evenly pressed, as it lies in the jar layer on layer, and as this is difficult to arrange in any vessel of bulging form, my jars were made quite cylindrical, and they answer admirably. They stand twenty-two inches high and have a diameter over all of ten inches, and have flat flanged lids with loop handles. They are of the strong buff stoneware, like salt-jars, glazed inside and out. In order to keep the material well pressed down, I had some leaden discs cast of such a diameter as to go easily inside; these are five-eighths of an inch thick, and weigh fourteen pounds each, and have also handles to lift by.

"The Rose petals are thrown in, about two good handfuls at a time, and are made to lie close together by gentle ramming, and have a thick sprinkling (not quite a covering) of the salt mixture. This is of equal parts bay salt and kitchen salt; the bay salt, which comes in hard lumps, being roughly pounded, so that the greater part of it is in pieces the size of peas or smaller. The Rose leaves are put in as before, two handfuls or so, rammed, salted, and so on till all are in, then the leaden weight goes in, and the jar is covered till the next supply is ready.

"The process is the same with the leaves of Sweet Geranium, only that they are taken off their stalks before they are dried, and all but the smallest are pulled into three or four pieces. They take about as long to dry as the Rose petals, and are laid out in the same way on the Rose-cloth. Sweet Verbena is of such a quick-drying nature that it has only to be stripped from the stalk and can be put in the jars at once; also Bay leaves, Rosemary leaves, and Lavender; but all are treated alike in that they are put into the jars in moderate layers, lightly rammed, salted, and pressed.

"Lavender, whether for Pot-pourri or for drying, should be cut as soon as a good proportion of the lower flowers in the spike are out. My friends often tell me that my Lavender smells better than theirs; but it is only because I watch for the right moment for cutting, and am careful about the drying. If it is picked for drying and is laid too thickly, it soon goes mouldy; it must be laid thinly and turned once or twice till it is dry enough to be safe.

"An important ingredient in Pot-pourri is strips of Seville Orange peel stuck with Cloves. The peel is taken off and cut in pieces from end to end of the Orange, so that each is about half an inch wide in the middle and two inches long; holes are pricked in it, and the shaft of the Clove pressed in so that the heads nearly touch each other. The pieces are then packed into a jar firmly with the hand—they would not bear ramming—with sprinklings of salt in between and over the top. This is the first ingredient to be made ready, as the Oranges are in season from the end of February to the middle of March; the last batches of preparation being made towards the middle of September, of the later pickings of Sweet Geranium.

"The materials seem to be mellow and better for being left for some time in the preparation jars, so I put off the final amalgamation till near the end of October. The jars now hold the produce of some seven or eight bushels of Rose petals, about four bushels of Sweet Geranium, and another bushel of various sweet leaves, all of course much reduced in bulk by drying and ramming; with this is about fifty pounds of the mixed salt.

"Now we have to get together the spices, sweet gums, and Orris-root. As an improvement on plain Orris-root it is advisable to use Atkinson's Violet Powder; we therefore have five large packets violet powder, 1lb. ground allspice, 1lb. ground Cloves, 1lb. ground Mixed Spice, 1lb. ground Mace, 1lb. whole Mace, 1lb. whole Cloves, 1lb. pounded Gum Benzoin, and 1lb. pounded Gum Storax or Styrax. All the powders are mixed together in a large bowl and the whole Mace and Cloves in another bowl, and now we are ready for the grand mixing. A space is swept on the brick floor of the studio just in front of the raised hearth of the broad ingle; the full jars are brought into a wide half-circle, the home children and their elders, and perhaps one or two neighbours, are convened to the Pot-pourri party, with tea to follow; one mixer is posted at each jar or bowl, and the materials are thrown handful by handful on to the floor in the middle space.

"When first I made Pot-pourri it could be mixed in a large red-ware pan; as I grew more ambitious the mixing was done in a hip-bath, in later years in a roomy wooden tub, but now the bulk is so considerable that it can only be dealt with on a clear floor space.

"The heap rises, and from time to time has to be flattened as the jolly party all round throw in their handfuls. The post of honour seems to be the distribution of the Orange peel stuck with Cloves, but the claim for the supreme dignity of this office is clearly though tacitly contested by the holder of the large basin of 'sauce' of sweet powders. The pressed stuff in the jars is so tightly compacted that it has to be loosened by vigorous stabs and forkings with an iron prong, by one whose duty it is to go round and fork it up so that it can be handled; this official can hardly get round in time to satisfy the many calls of 'Please give me a stir up.' The heap grows like one of the big ant hills in the wood, until at last all the jars are empty, and everyone's hands are either sticky with salt or powdery with sweet spices. Now the head Pot-pourri maker takes a shovel, and turns the heap over from left to right, and then right to left several times till all is duly mixed. Then the store cask is brought forward: a strong iron-hooped Oak cask with a capacity of fifteen gallons. It looks as if the fragrant heap could never be got into it, but in it goes shovelful by shovelful, and again it is rammed, until all is in, leaving only a bare two inches of space on the top. The cask has been made on purpose and has no upper head, but a lid with a wood-hooped rim that fits over the edge, and a knob handle set out of the centre, the easier to lift the cover by jerking it to one side.

"The full cask is now so heavy that it is a job to get it back to its place against a farther wall; it must weigh a hundredweight and three quarters, possibly more. If the mixture stays some weeks or even months in the cask before any is taken out, by remaining untouched for a while it seems to acquire a richer and more mellow scent.

"The studio floor is left in a shocking state of mess. A wide space in front of the ingle shows a dark patch of briny moisture; footmarks of the same are thick in the neighbourhood of the site of the heap, and some small tracks further afield show where little feet have made more distant excursions; but it is growing dark, and we must leave it and wipe our shoes and go in to tea, and there will be a half-day's work for the charwoman to-morrow.

"The foregoing description answers my friends' questions as to how I make Pot-pourri; but it does not follow that they may not make it in different and better ways, according to the degree

possess a distinct beauty, and where it will do, as shown in the illustration, that is a climate to suit many tender things of extreme beauty and interest. Its value as a wall shrub is well shown, the flower-laden shoots falling over the wall in welcome profusion. It is hardy in this sense, that it is quite happy in southern counties with a little winter protection.

LILIUM POMPONIUM.

MR. ELWES, in his "Monograph of the Genus Lilium," says that the Lily which went by the name of *L. pomponium* in English gardens during the last century until Mr. George Maw, about 1875, reintroduced the true type from the Maritime Alps of Northern Italy, was the dull red variety of *L. pyrenaicum*. Mr. Elwes does not know the date or place of the origin of this variety, of which he figures a flower. He found, however, that it had so universally taken the place of the true *L. pomponium* as to give rise to a suggestion that it may be a degenerate form of that species changed by long cultivation. But if this is so, the typical yellow *L. pyrenaicum* must also be—as indeed Mr. Baker strangely suggests that it is—a variety of *L. pomponium*. Having cultivated the red and the yellow *L. pyrenaicum* together for many years, I can affirm confidently that there is not the least difference in character or habit between the two, except the colour of the flower, both being equally perispermous, and increasing with equal rapidity. On the other hand, I have always found the true *L. pomponium*, which has several obvious characters distinct from those of *L. pyrenaicum*, very difficult to establish and persuade to flower at all. The true species can now be obtained from several bulb dealers at a reasonable price, but I seldom meet with it in gardens, and more frequently find the red *L. pyrenaicum* doing duty for it. There is no doubt that *L. pomponium* as well as *L. pyrenaicum* was well known in cultivation by Clusius and Parkinson, who correctly describe and figure both, assigning to them their true habitat Northern Italy and the Pyrenees respectively.

There is an interval of about 100 miles between the eastern limit of *L. pyrenaicum* and the western of *L. pomponium*. The confusion between the two species prevailed early in the nineteenth century, perhaps owing to the appearance in gardens then of the red form of *L. pyrenaicum*, which proved far easier to cultivate and keep. In the *Botanical Magazine*,

tab. 798 (A.D. 1805), we find the typical yellow *L. pyrenaicum* figured and described as *L. pomponium*, and in the same work, tab. 971 (A.D. 1807), "*L. pomponium* with scarlet flowers." This last seems to be the true *L. pomponium*, though the leaf characters are not distinctly shown, the plate being confined to the flower-head. In the description of tab. 798 the plant is said to be found in the Pyrenees, and to "vary with red and yellow flowers," but probably this is said because the two species were confused. Mr. Elwes says that *L. pomponium* thrives and increases in his garden.

As I said above, I have tried in vain to please it. The bulbs survive and make a weak growth for two or three years, the occasional shabby flowering showing a brilliancy of scarlet even more vivid than that of *L. chalcedonicum*. I should be glad

SOLANUM CRISPUM OVER A WALL IN THE SOUTH-WEST.

(From a photograph by Miss Willmott.)

of personal intelligence and ingenuity that they may bring to bear on the material they have at disposal."

NOTES ON HARDY PLANTS

SOLANUM CRISPUM.

SO luxuriant a growth of *Solanum crispum*, shown in the illustration, will be interesting to many gardeners, amateur and otherwise. It is from a photograph taken in a garden in the south-west, and in the southern gardens of England it is hardy. Not so, however, in the midlands and the north. Its delicate purple-coloured clusters

to hear the experience of any readers of THE GARDEN who know the true *L. pomponium*.
Edge Hall, Malpas. C. WOLLEY DOD.

LITHOSPERMUM PROSTRATUM.

ON page 99, "S. G. R." gives much information to those who may not have been successful with this beautiful hardy plant, with the greater portion of which I agree; but I notice that your correspondent finds it thrives best on a raised position. No doubt this is so where the situation is low and the soil heavy, but in some soils it thrives grandly on the level. In proof of this, I may say that when in North Hants, where the soil is light and sandy, with a subsoil of either gravel or sand, it grew amazingly. Like "S. G. R." we started with fine healthy plants, and from the same source. All the help we gave was simply putting in large stones in the soil round the plant, and allowing them to rise somewhat above the soil, on which they were soon established.

We grew many plants in this way on the margin of a long hardy plant border, and I shall never forget the eight these made beside *Saponaria ocyroides*, some of the mossy *Phloxes*, such as *Vivid*, *Nelsoni*, and many others, with fine groups of *Aubrietia Hendersoni* and other sorts, and close by the Prophet Flower did splendidly. Most of these patches were from 1 foot to 3 feet across, and were growing on the level in the natural soil.

J. CROOK.

HELIOPSIS SCABRA AND ITS VARIETY PITCHERIANA.

Of the half dozen or so species of *Heliopsis* known to botanists there are few so much grown in gardens as the pretty and useful *H. scabra*, at one time known as *H. levis* var. *scabra*, but now recognised as a distinct species. It is a useful border plant, growing from 2 feet to 4 feet or 5 feet high, and giving a number of flowers 2 inches or more in diameter. These are bright yellow, and are produced on stiff, stout stems, the leaves being rough to the touch. In its ordinary habitats in the United States and Canada it affects principally dry soils and positions, so that it is found well suited here for the drier parts of the garden. Its native name of Rough Ox-eye or Rough False Sunflower is descriptive of the general appearance of the plant and its flowers. The variety called *H. scabra pitcheriana* is even to be preferred to the type on account of the richer colouring of its flowers, these being a deep orange. It is quite as vigorous and free flowering as the type, so that it may be planted in preference to it for the sake of its less common colouring at the season when it blooms—from June to September. S. ARNOTT.

THE TULIPAS.

(Continued from page 93.)

II.—MAY-FLOWERING OR COTTAGE TULIPS.

THIS splendid race has of late years become deservedly popular, quite surpassing the early bedding Tulips in general usefulness, whilst many possess delightfully soft and refined colour shades found in no other group. They are mainly strong, vigorous plants, generally much taller than the early flowering group, and, though quite as useful for bedding where their later season of flowering does not hinder the summer bedding arrangements, they are really better adapted for the hardy border. They may, as a rule, be forced easily, but they cannot be depended upon unless given plenty of root run, and their time of flowering is a little irregular—a few laggards occur in nearly every planting—a desirable feature in a border plant, as the season is thereby prolonged.

Recent additions to this group are a great gain, and one hears of still better things awaiting introduction, and others in the process of development. There are hundreds of them already, and selection is imperative if their

high standard is to be maintained, discarding those of weakly growth, poor colouring, or whose petals "weather" badly. A few of the old types still hold their own against the new comers, and they have been included in the following list of twenty, selected as representative of every known type, colour, and form, and which possess many good qualities from the gardener's point of view.

They owe their name to the fact that they were first grown in the old British cottage gardens, they represent no distinct type, but embrace self-coloured and "broken" Tulips in all late-flowering sections, varying greatly in size, shape, and stature, and it is this diversity of form that renders the group so fascinating and popular. Essentially English Tulips, their cultivation does not differ from the general race, and beyond that their vigorous constitution is best maintained by annual lifting and ripening there is nothing particular to record in this respect.

Beauty of America is a slender-growing plant 18 inches high, the flowers of which are goblet-shaped, pale yellow, changing with age to a silvery white with sulphur shading, and base a slightly darker stain of yellow. The outer petals reflex with age, and their tips are tinted green. Very pretty.

Blushing Bride (*Isabella*, *Shandon Bells*, *York and Lancaster*).—A stout plant 1 foot high, with massive petals 5 inches long, the margins of which are rolled inwards. Colour white, heavily flushed rose, and variously spotted and feathered rose throughout the flower, basal colouring blue, yellow, and white, in concentric rings, generally ill-defined; outer base pure white. A very variable plant, white or rose dominating in various specimens. A popular bedding Tulip.

Bouton d'Or (*Ida*, *Golden Beauty*, *lutea*, &c.).—A bold erect Tulip 2 feet high, with globular rich yellow flowers free from any basal stain. The anthers are black. In some soils a reddish feathering suffuses the outer basal half of the flower with age. A capital bedding Tulip, thrives well in grass for several years undisturbed, and considered the best yellow Tulip for long distance effect.

Cottage (*Cottage's Pink*).—A new comer, with strong stems 18 inches high, bearing pretty rose-coloured flowers, the petals of which are rounded, all equal, the three outer recurving; the three inner are hooded. Basal colouring a five-rayed star of greenish blue, resting on a yellow disc as large as a florin. A very pretty Tulip, coloured like a chestnut Hybrid Rose.

Fairie Queen.—A strong-stemmed plant 1½ feet to 2 feet high, the flowers of which are egg-shaped, 4 inches long, coloured a rosy heliotrope shading to old gold at the margins. Basal colouring ruddy brown. A fine Tulip of excellent form and distinct colouring, but slightly evil-smelling when cut and placed in a warm atmosphere.

Gala Beauty (*Columbus*).—Pretty pointed flowers 4 inches long on stems 18 inches high, coloured crimson, variously and heavily striped, flaked, and edged yellow, often quite yellow with a few crimson flakes, or vice versa. The surfaces of the petals are very lustrous, and it is at all times a brilliant Tulip.

Gold Flake.—A strong-growing plant of *T. macrospeila* form. Flowers 4 inches to 5 inches long, the petals of which are very broad, lustrous, and coloured an orange red, variously flaked with yellow and dark crimson. The basal colouring is yellow and the anthers are black. It is probably derived from *T. macrospeila*, with which it agrees in its ground colouring and sweet fragrance.

Inglescombe Scarlet.—Stems very strong, often two to three flowered. Flowers shaped like Yellow Gem, but not so markedly hooded. Petals somewhat twisted, rich glowing scarlet in colour, heightened by the well-defined glowing black centre. Their surfaces are very lustrous, and they often measure 5 inches to 6 inches long. A magnificent Tulip of recent introduction, and a great advance on anything so far obtained. Its freedom in flowering and strong, vigorous habit are excellent features.

Innovation.—Very strong plant, but the stems are too slender to hold the flower erect in all instances. Flowers exceedingly large and well developed, 6 inches long, 10 inches across, coloured a rich creamy tint, shading to a white marginal colouring, flaked with rosy carmine always near the tips, and occasionally elsewhere. A monster Tulip with many good qualities, but it requires to be well grown in order to strengthen its stem.

La Candeur (*Parisian White*, *Snowdon*).—Neat habited plant 18 inches high. The flowers are egg-shaped in a bud state, 3 inches long, pure white throughout, with rounded petals, which become margined with pink as they age. A neat bedding Tulip.

La Merveille.—An elegant Tulip 18 inches high, stem is somewhat slender but quite rigid under good cultivation. Flowers 4 inches to 5 inches long, outer petals pointed, the inner more rounded, colour a rich reddish apricot with orange shading. The base of the flower is stained with yellow, with a darker dividing zone. A very beautiful Tulip, excellent as a bedder, wonderfully rich in colour under all conditions of light, and a flower one can recommend for the decoration of apartments. Its variegated sport is a hideous plant in comparison.

Leghorn Bonnet.—A fine new Tulip, with stout stems 1½ feet high, bearing distinctly three-sided flowers coloured straw yellow, brighter on the inside, distinctly inflated in a bud state and tinged with green when they first open. The petals are pointed, very broad, and of stout weather-resisting texture. Their shape, size, and colouring are all that can be desired, and one can recommend this plant as a really good novelty.

Maid of Honour.—A pretty slender-growing Tulip allied to *Beauty of America*. The flowers are of medium size, coloured sulphur-yellow, slightly feathered carmine at the margins and near the base. The petals are rounded, the outer reflexing, the inner hooded, and their bases are slightly stained pure yellow. Remarkable for its soft delicate colouring and faint carmine tracery.

Orange King.—A bold Tulip of great strength. Petals rounded, very stout and broad, coloured a soft orange vermillion shading to scarlet, delicately toned towards the margins. Their surfaces are very lustrous. The shape of the flower is that of Gold Flake, a deep, long-tubed, inflated funnel when closed. The basal colouring is golden yellow, lined with a clear black tracery, very fragrant.

Parisian Yellow.—Still the best of the yellow Tulips. Stems 1½ feet high, bearing long petalled flowers 5 inches deep, coloured pure yellow, brighter internally, heightened by a dark green basal stain. The petals are hooded not reflexing, and their margins are turned inwards at all stages.

Picotee (*Maiden's Blush*, *La Vierge*).—An old garden Tulip of general excellence. Flowers pointed, reflexing, of stout substance, 4 inches to 5 inches long, white, tipped with green, edged with pink, gradually becoming suffused with pink as the flower ages. A spurious plant with a dark brown basal stain is in commerce under

this name. The true plant should have a slight yellow stain.

Striped Beauty (Summer Beauty).—A grand "broken" Tulip, 1½ feet high, the petals of which are white, flamed with grey, crimson, and blue, of great depth and substance and unusual brilliancy. It is a singular-looking flower, the colouring being in the form of narrow radiating lines, each colour blending well.

Sweet Nancy (Narbonensis alba).—A pretty white-flowered Tulip, the leaves of which are flat, ascending and clasping the stems. It grows 16 inches high, and bears egg-shaped flowers, the petals of which are pink tipped, edged with faint lines of pink near the base. The basal colouring is in the form of a black ring, often very slight. An excellent bedding Tulip of regular height.

The Fawn.—A strong-growing, stout-stemmed plant, 2 feet high, bearing one or two fawn-coloured flowers flushed with apricot on the outside and edged with old gold. They are egg-shaped, 4 inches long, and coloured greenish at the base. The outer colouring is softer and more refined than the inner. A very choice Tulip, distinct in shape and colouring. All it lacks is a pleasing fragrance.

Yellow Gem.—Stems 1½ feet to 2 feet long, leaves very broad, quite 1 foot long, and deeply channelled. Flowers 4 inches to 5 inches long, contracted near the middle, hooded at the tips, coloured a soft shade of sulphur-yellow throughout, save the slightly darker basal stain. A grand Tulip, with all the good attributes of *T. fulgens*. It requires good cultivation to develop substance of petal.

G. B. MALLETT.

(To be continued.)

THE FLOWER GARDEN.

THE FAMOUS FUCHSIA WALK AT PENRHYN, NORTH WALES.

ONE of the most beautiful features in the gardens of Lord Penrhyn, Penrhyn Castle, Carnarvonshire, is the Fuchsia walk. Let the reader gaze for a moment at the long colonnade, with its series of arches, through the cool shadow into the sunlight at the far end. Let him try to read into the picture the tender green of the foliage, the graceful droop of the scarlet and purple tassels. He will then realise that at Penrhyn such use is made of the noble tree Fuchsias as is, so far as we are aware, made nowhere else. Devon or Cornwall may show something like it, but North Wales certainly does not.

BORDER CARNATIONS.

It is useful to look round each season before layering the Carnations for another year, and note how they have withstood the vagaries of climate. For rude health and surpassing vigour there is, of course, nothing like a bed of seedlings, but even in these days of seedlings, so marvellously true to strain, there are old favourites that we cannot do without. In looking over a town garden where Carnations are the mainstay of August I note how entirely different is the display this year to previous years. The petals of scarlet Carnations seem the most solid, while the soft pinks and roses have all rotted. Some whites stand to perfection, as do the white ground Picotees. Yellow ground Picotees also stand extremely well. Most dark varieties suffer in the petal; even the hardy cloves have many petals disfigured, while the orange and buff shades are utterly and entirely spoilt. Some pure yellows stand the wet quite well. The list runs thus: All

the scarlets stand rain; of whites, some suffer very much, while Trojan and White Swan are quite proof against days of storm. No soft pink has stood satisfactorily, but rose and deeper shades stand well. Of the very deep maroons, Mephisto stands out as impervious to wet.

Picotees stand the rain best of all, particularly the white grounds. Yellow ground Picotees stand well, but vary considerably; Goldfinder, Mrs. Tremayne, Lady St. Oswald, and Ladas are all above reproach in a wet season. Of yellows, Miss Audrey Campbell and Pandeli Ralli are conspicuous by their fine petals and perfect blooms. There are many failures, however, and such prime favourites as Midas and all the orange and buff shades are a practical failure. Belladonna, which two years ago was the pride of the garden, has hardly half-a-dozen blooms fit for cutting where some hundreds would have been gathered. I hope others will say what has stood well with them on a heavy soil, for, of course, on all light soils the rain has only helped, not hindered, the blooming; while in hot and dry years the strong soils have the monopoly, one might say, of this most valuable border flower. E. H. WOODALL.

HERBACEOUS PHLOXES.

PERHAPS one of the most seasonable of hardy flowers at the moment is the herbaceous Phlox, a group of showy perennials that if well grown should rank among the best of subjects in the open garden during August and September. Now and again we hear the remark that it has or has not "been a good year for Phloxes," a remark, doubtless, intended to bear some relation to the weather of the few preceding weeks. As this group of Phlox is singularly benefited by moisture—and root moisture is an essential to the finest flower development—it follows that the present year has been favourable to good growth and large heads of bloom; and, indeed, this is very true. But while in June and early July this fine border plant had its fill of moisture, there may be instances of dry sandy soils that require attention in this detail

A FUCHSIA WALK IN LORD PENRHYN'S GARDEN, PENRHYN CASTLE, NORTH WALES

now. At no time is root moisture more necessary than when the flower-heads and the flowers, too, are in course of formation, and this abundant moisture is just as much a necessity in the expanding of the flowers a little later. Hot and dry sandy soils, or those again much drained by gravel and sand, are the first to dry up with a few days hot sun, so that a mulching of decayed or partly decayed manure may be added with advantage.

Of so much importance are these items at this time, and especially when the flower-heads are required for exhibition, that I formerly flooded the specimen beds of Phloxes three times weekly, and for isolated clumps in the border where these gay flowers are grown it repays just as much to supply the plants abundantly either with water and a mulch or with liquid manure. Even on the more holding soils, where this root moisture is less essential, the plants are immensely improved by liberal applications of it from time to time. When this fondness of the Phlox for moisture is more

obtain a good hold. This, followed by watering, will ensure splendid heads of bloom.

While this section of the Phlox has for years past reached a high state of perfection new sorts are always appearing. The following are among recent novelties:—

Atala.—China rose, with white star-like centre, well-formed flower, and abundant bloomer.

Fille d'Ève.—A creamy white variety with deeper coloured centre, flowers very large, habit dwarf and good.

Pandora.—Carmine-lake, with starry white centre; a showy Phlox.

Mozart.—Ground colour salmon-rose, with large blood-crimson centre; a most effective plant, with handsome flower-heads.

Zouave.—Magenta with carmine, with great flowers nearly 2 inches across; a fine showy variety.

Balzac.—Rose-lilac, suffused slaty blue, and purplish centre.

A GROVE OF HORNBEAM.

fully realised we shall see good Phloxes in most seasons.

Some declare the Phlox to be all but worn out three years from planting, but as a set-off against this I may state that I have a long line of my fine white Phlox Mrs. E. H. Jenkins planted some seven years since producing heads of bloom far larger than those usually exhibited. Many of the clumps have from thirty to forty stems that will maintain a succession of flowers for weeks to come.

From this it will be seen that a generous cultivation may have more to do with complete success than the age of the plant. One important item too often overlooked is this: These Phloxes are great surface rooters, and unless these surface roots are catered for by mulching and by watering they are valueless.

Old beds or plantations may be mulched with soil and manure in equal parts, and bone-meal or blood manure may be added liberally also. This soil mulch, as, indeed, any mulch, is best if made quite firm, so that the roots may

Mr. Gladstone.—Delicate satiny rose, with brighter rose centre, very handsome in truss and showy in colour.

Papillon.—Practically a rayed flower, one-half of each petal being of a lilac-blue shade, the other ash-grey; a novelty.

Claude Joffroy.—Rosy violet, flowers very large. *Lumineux*.—The colour of the China Rose, the flowers very large and showy.

Sesostria.—Very handsome heads of royal purple flowers.

Julie Roussel.—Pure white, with rosy carmine eye; a noble panicle of handsome flowers.

To these may also be added such fine things as *Etna*, a very large flower of a lively scarlet-rose; and *Coquelicot*, fiery vermillion, with deeper centre. In the opposite extreme of pure whites I select *Sylphide*, *Fiancee*, *Albatre*, with Mrs. E. H. Jenkins already named, which I regard as one of the most effective of pure white Phloxes in cultivation to-day.

Hampton Hill.

E. H. J.

TREES AND SHRUBS.

GREEN ALLEYS AND GROVES.

WE have on more than one occasion described the beauty of green alleys and groves, and to avoid repetition refer our readers to THE GARDEN of October 20, 1900, page 315, in which the advantage of such features in the English garden are set forth, but this is the first opportunity we have had of showing the picturesqueness of a grove of the common Hornbeam. The illustration speaks for itself, and shows how beautiful a well-known tree is when made to form such a feature as is shown in the reproduction of a photograph kindly sent by Miss Willmott.

BUDDLEIA VARIABILIS.

BUDDLEIA VARIABILIS may be included among the most promising shrubs introduced from China in recent years, and in the less favoured parts of the British Isles it will probably rank among Buddleias next to the yellow-flowered *B. globosa* in merit. Of course, *Buddleia Colvillei* is finest of all, but it only thrives in the mildest counties. It is of a semi-herbaceous character and grows late into the autumn. In spring it shoots freely from the old wood, and during the summer makes growths 4 feet to 5 feet long. It is a vigorous plant and flowers abundantly. It varies in habit, and there are at Kew plants of quite a prostrate growth, whilst in others the branches are sturdy and arching or almost erect.

Our gardens are indebted for this shrub to the French missionary, M. l'Abbé Soulié, who sent seeds to France in 1893. From these seeds plants were raised that flowered and were exhibited the following year. The species was, however, named independently of these plants the same year by Mr. W. B. Hemsley, from dried material sent to the herbarium at Kew by Dr. Henry, who has found it in several parts of Central China, but the seeds from which the plants cultivated in Europe were raised came from Eastern Thibet.

This *Buddleia* ripens seed in plenty, and the plants are all the better if what is not required of this be removed as soon as the flowers are over. The species can also be increased by cuttings taken when the growths have got moderately firm. It appears to thrive best in a young state, and the stock ought to be renewed occasionally either by cuttings or seeds. As to soil, a good sandy loam is probably the best, and if, besides this, a sunny position can be provided, this *Buddleia* will prove a welcome addition to the rather scanty number of shrubs whose flowering time comes in late summer and early autumn.

THE ROSE GARDEN.

NOTES FROM A YORKSHIRE GARDEN—ROSES, 1903.

IN spite of early and late frosts Roses in this district (West Riding) have done very well as to blooming, although the leafage in some cases has been somewhat sparse. Probably our northerly latitude and usual late pruning gave us, for once in a while, an advantage over some of our southerly friends, who in most years are gathering Roses long before we poor northerners are able to do so. Be that as it may, we have had, and still have, some beautiful blooms, and in good quantity, and although there has been some mildew the majority of the Roses have grown sturdily, both in old and new beds.

Content six years ago to begin with H.P.'s, Teas and Hybrid Teas have been added in recent years, and have proved in every way a success; indeed, taking them all round, the H.T.'s perhaps hold the premier place in the Rose garden. The favourites include the well-known names of Caroline Testout, Marquise de Salisbury,

Liberty, Gräse an Teplitz, Mme. Abel Chatenay, Viscountess Folkestone, Killarney, Papa Gontier, Gustave Regis, and Camoens. The one stem of Camoens bears seventeen buds.

A Rose-bowl on my table holds blooms of Marquise of Salisbury, Gloire Lyonnaise, Billiard et Barre, and Mme. Chedane Guinoisseau, all so lovely on the tree and equally charming when cut. Amongst Teas the two last named are great favourites, and are closely followed by Marie van Houtte, Anna Olivier, Maman Cochet, White Maman Cochet, Enchantress, Mme. Lambard, and Dr. Grill. These are most satisfactory in every way, and surely the error that some people labour under in still thinking that Tea Roses will not grow in the north may soon be entirely a thing of the past.

In winter they were protected over the roots with Bracken, but the garden is situated very high up and a good deal exposed to the winds and frosts. The old friends amongst the H.P.'s, including Mrs. John Laing, Mme. G. Sharman Crawford, General Jacqueminot, Ulrich Brunner, and a dozen others, still charm by their richness of colour, and the majority of them also by their fragrance.

WALTER JESPER.

USES OF BRITISH PLANTS.

(Continued from page 152.)

XII.—CORNACEÆ.

CORNEL (*Cornus sanguinea*).—This is a hedge shrub with opposite leaves, corymbs of creamy white flowers, and black berries. The wood is hard, and was formerly used for cog-wheels, as well as for butchers' skewers and ramrods. It is one of the best woods for gunpowder. The fruit contains a good deal of oil, which might be utilised if necessary, as it is in France, for the manufacture of soap. The berries are not edible, and, as Parkinson observes, not even "fit for dogs," hence its name Dogwood, but it is a doubtful etymology, though Prickwood, as it is also called, is a more appropriate term, since skewers and wooden pins were made of it formerly.

CAPRIFOLIACEÆ.

Dane-wort (*Sambucus Ebulus*).—This herbaceous shrub is also called Dwarf Elder, and in the fourteenth century was known as Ebulus and Walwort. In the sixteenth century a synonym was Chameactis, derived from the Greek word; but the origin of Dane-wort, which appears in "Gerarde's Herball" (1597), is obscure. It was used for gout, fester, wounds, &c., in the fourteenth century, and was held in rather high repute, as every part of the plant is cathartic and emetic. The berries yield a violet dye.

Elder (*S. nigra*) is well known for its large scented corymbs of yellowish white flowers, purple berries (sometimes green when ripe), and leaves resembling those of the Ash tree. The flowers, which yield a volatile oil by distillation, are used in poultices, &c., and the berries make excellent wine, yet an infusion made from the leaves is fatal to insects, so that gardeners often use a strong infusion to preserve delicate plants from insects and caterpillars. In the fourteenth century the middle bark of the Eller* was used for dropsy.

RUBIACEÆ.

Yellow Bedstraw (*Galium verum*).—This plant can furnish a red dye like its ally, the Madder of the Continent (*Rubia tinctorum*). It has been cultivated for this purpose, but with little or no profit, as the roots are too small, though it has been used in the Hebrides for dyeing woollen stuffs red. The stems and leaves are described as yielding a good yellow dye used in Ireland. Another use of the plant resided in its property of acting like rennet in curdling milk, and is used in Gloucestershire for this purpose. It was called "cheese renning" in the sixteenth century, and Gerarde says (quoting from Matthioli, a famous commentator of Dioscorides) "the people of Thuscane do use it to turne their milke, that the

cheese which they make of sheepes and goates milke, might be the sweeter and more pleasant to taste. The people in Cheshire, especially about Namptwich, where the best cheese is made, do use it in their rennet, esteeming greatly of that cheese above other made without it." The name Galium is from the Greek *gala* (milk), probably in reference to its coagulating properties.

Cleavers (*G. Aperine*).—This plant is extremely common and well known for its little twin berries covered with hooked bristles, hence its name. It

for scalds and burns in the fourteenth century, under the names Heyryt, Gosgres, Cliure, and tongebledes, or as we should spell them, Goosegrass, Cleaver, and Tonguebleed, doubtless from its roughness due to incurved hooks all over the plant. Later uses were for colds, swellings, &c., the whole plant being rather astringent.

Wood-ruff (*Asperula odorata*) is remarkable for its sweet scent of Hay. The common name in the fourteenth century was Herb Water for Herb-Walter; and in French *Muge de boys*, Musk of the

BUDDLEIA VARIABILIS IN THE SOUTH-WEST. (See page 152).

is also called Goosegrass as a food for geese, being often collected for poultry. Horses and cattle will eat it with relish.

The seeds are described as being an excellent substitute for Coffee; but whether they contain the same peculiar alkaloid is not known, though both plants belong to the same family. It is said they are used for this purpose in Sweden. It is also remarkable that the custom of employing the stems as a sieve in the time of Dioscorides is still maintained in Sweden. It was used as an ointment

Woods, or Wuderove as early as the thirteenth century. Later it was spelt in a rhyme,

WOODDE-
ROWFFE.

It was much used in medicine in the Middle Ages; but without having any real virtues.

VALERIANEÆ.

Valerian (*Valeriana officinalis*) is a tall herbaceous plant, with leaves resembling those of the Ash and corymbs of pink flowers. It is retained in our

* Eller was the correct word, Elder is a later corruption.

Pharmacopœia as a nerve medicine, being antispasmodic. Its properties are due to a volatile oil in the roots. The scent has a remarkable attraction for cats and rats, these latter being caught by a bait of Valerian root.

Corn Salad (*Valerianella Olitoria*).—This little plant is found in Cornfields, &c., and is also called Lamb's Lettuce. It is a doubtful native, as it has been long cultivated, but superseded by other plants for salads. It is much more known on the Continent.

DIPSACEÆ.

Teasel (*Dipsacus sylvestris* var. *Fullonum*), the Fullers' Teasel.—The common wild Teasel is of no value, though supposed to have medicinal virtues in olden times, when the water caught in the little troughs between the opposite leaves was thought useful for bad eyesight. It was called *Virga pastoris* in the fourteenth century, and was an ingredient of "Save," a remedy for wounds. The Fullers' Teasel is a variety with recurved bracts on the heads of flowers. They are used for raising the nap on cloth. A number of heads were placed in a flat, brush-like frame, and drawn over the cloth. A later method is to fix them on a revolving cylinder. It is remarkable that no artificial invention has superseded the natural Teasel-head for this purpose. The stem, as of many other plants with opposite leaves, is subject to a curious torsion. Some years ago they were utilised for parasols, being very light, and sold under the name of "Eucalyptus" handles.

Devil's-bit Scabious (*Scabiosa succisa*) is a common meadow plant, which derives its name from the truncated subterranean rhizome. It is used on the Continent as supplying a yellow and green dye. It is a very astringent plant, and the rhizome has been employed as a material for tanning purposes.

GEORGE HENSLOW.

CORRESPONDENCE.

(The Editor is not responsible for the opinions expressed by correspondents.)

HUMEAS AFFECTING PEACH TREES.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—Your correspondent Mr. Harriss does good service to gardeners in bringing to their notice the injurious effects of Humeas elegans on Peach trees. When my attention was first directed to this matter I had some difficulty in believing that an old favourite of mine like the Humea could possibly injuriously affect a still greater favourite, the Peach, and consequently I was determined to bring the two together, with the result that in twenty-four hours the injurious effect of the Humeas was quite visible, and in forty-eight hours they had to be removed, the leaves in close proximity to the Humeas having the appearance of being severely scalded. As Mr. Harriss truly says, the browned patches eventually drop out, and leaves, too, that seemed unaffected, dropped in great numbers, leaving the branches without foliage, specimens of which, Mr. Editor, I enclose for your inspection. This recalled to my recollection a similar instance about fourteen years ago of Peach trees being severely affected by Humeas in exactly the same way, but at that time I never suspected the Humeas, but can well remember overhauling the borders trying to discover some noxious gases, to which I then attributed the result, but without success. Now I think it is time to minutely observe what effect Humeas may possibly have upon other and even more tender plants than the Peach. I am sorry to have to put a black mark upon the character of the Humea, the scent of which to me is most refreshing.

WILLIAM FYFE.

Lockinge Gardens, Wantage.

[Mr. Fyfe sent a bundle of shoots, which showed the great ravages caused by the Humea. This fact is of the greatest interest.—Ed.]

THE USELESSNESS OF MALMAISON CARNATIONS.

[TO THE EDITOR OF "THE GARDEN."]

SIR,—At the risk of being taken to task "T." in THE GARDEN, August 15, draws attention to the uselessness of the Malmaison Carnations, and says that he fails to see the beauty of this sort unless size alone is a merit. Certainly size is a great point, and employers who are fond of Malmaisons want size. Ladies like to wear them as a bouquet or spray by day, because of their lasting quality and fragrance. It is difficult to get many choice flowers to last so well as the Malmaison Carnations. Some of the border varieties are very good grown in the same way, especially Cecilia. Catleyas, Odontoglossums, and many other Orchids are, of course, quite as much appreciated, but ladies will ask for these at night and the Malmaisons to wear by day. It is not always for the gardener to choose what shall be grown. He invariably has to fulfil the requirements of his employers. No doubt where sufficient house accommodation does not exist, and where the gardener is expected to grow plants equal to those of his neighbour with adequate accommodation, he would not regret to see them go out of fashion; but those who have accommodation, and are able to cultivate them well, are aiming at still higher possibilities. I think that the future of the Malmaison is a great one, and I know many ladies and gentlemen that have recently built houses to grow them. They are not likely to get so common as the border varieties, and what makes the Malmaison more popular, perhaps, is that it comes just as the London season is in full swing; and, as I have already said, the flower is so suitable for ladies to wear out of doors whilst walking or driving in the open carriage, as it will last throughout the day. Perhaps your correspondent "T." has not been successful with these plants or I am sure he would know the usefulness of them. They fill a great gap just after the great bulk of forcing material is exhausted, especially two and three year old plants, for furnishing the conservatory, grouping in the hall, and for table decoration. They are constantly admired when set up with taste. Some of the border varieties grown in pots in the shape of yellows, &c., to lend colour are often used in places for decorative purposes with the Malmaison, but the Malmaison stands out pre-eminent.

C. J. ELLIS.

NURSERY GARDENS.

MESSRS. JAMES CARTER AND CO.'S MORTLAKE TRIAL GROUNDS.

MOST fortunate in getting possession of the ground on which their various flower, vegetable, and other trials are conducted is this eminent metropolitan seed firm. It is placed just midway between Mortlake and Richmond Stations on the Windsor branch of the South-Western Railway, the front being the high road so greatly frequented which runs from Richmond to Putney, and the base touches the railway. Hence all its products are seen by tens of thousands of passers-by during the season. Our visit was unavoidably late, but there is always something to see in such trial grounds, and though the huge trial of some 1,000 rows and 250 varieties of Peas was practically over, there were many other things to command attention. The firm have a high reputation for their lawn grasses, and to that end keep very many patches of diverse grasses and mixtures suitable for lawns, tennis courts, cricket pitches, bowling greens, and golf greens. All of these, some fifty in number, of varying sizes, though many are about 2 yards square, were sown last autumn, as early as September, some in October, and others in March and April. Besides these testing patches there are two large ones—quite small lawns—specially kept to show the value of their grasses for golf greens. All are kept regularly mown, and, whilst some grasses or

mixtures please better than others, all seem so good as to leave little room for complaint. What are described as Invicta Mixtures, varying according to soils and requirements, give most perfect lawns, and the patches sown as late as the spring seem to be as good as those sown last autumn. The firm, however, strongly advise autumn sowing as best. They also advise using the seed with a liberal hand, even at the rate of some twelve bushels per acre. That anyone should endure the miseries of a weedy lawn when by first thoroughly cleansing the ground, then sowing with the best lawn grasses, they may have a lawn of the most perfect kind, passes comprehension. Those who want a real grass lawn should visit these trial grounds and see for themselves what good selected seed sowing can produce.

If Peas are over, there is furnished in the many pods put to dry off evidence of the care taken to secure fine stocks. The firm's experts go over every row or variety and mark the plants that are producing the best or finest pods. These alone when ripe are gathered, wintered, and then sown to create the improved stocks of the future. No other pods are gathered. That is one of the things which show what the seed trade is doing to supply the best class products to customers. Runner Beans are now fast coming to perfection, and the many stocks there represent the finest of strains. For the smooth-podded section we care little; they compare indifferently with the good old Scarlet or Dutch Runner sections for productiveness or for usefulness. How far we have got away from the old short-podded forms of Painted Lady and scarlet flowered the present stocks show. The firm have a strain which is designated Holborn Seedling. It gives seeds of diverse colours, and refuses to be selected; but no matter what the colour of the seed, it all produces the same fine, robust growth, abundant crops, and fine, long, handsome pods. A parti or red and white-flowered stock has been obtained, which resembles in bloom the old Painted Lady, but is far more prolific, as the pods are double the length of those of the original variety. Carter's Champion (white flowered) and Carter's Jubilee (red flowered), with Holborn Seedling and their Ne Plus Ultra all give grand crops and superb, long handsome pods.

Onions, both winter and spring sown, are just now a great feature. Of the latter there are some 250 rows, the stock throughout showing fine bulbing properties. Magnum Bonum, Carter's Long Keeping, Ailsa Craig, Bedfordshire Champion, Record, Holborn, a new late variety not yet named, and many others were of marked excellence. A huge breadth of Lettuces was over, with the exception of one curled Cabbage variety named Holborn Standard, that refused to run to seed at all. It is, indeed, a useful late keeping Lettuce.

There were eighty-five varieties of Beets, there were 600 rows, and a wonderful collection of stocks. Of them all, we liked none better than Carter's Perfection, an ideal garden Beet. Spring-sown Cabbages, too, were in huge quantity, but being sown late were not yet matured. There were various other vegetable stocks, but these suffice for reference. Of course flowers are grown in rich profusion. Specially noticeable was a big plantation of Hollyhocks from seed, carrying noble spikes of capital double flowers, varied in colours, white, yellow, pink, red, crimson, and other hues. A few of a new semi-double strain have beautifully fringed flowers.

The firm have long had a high reputation for their dwarf Tropæolums. Just now, in spite of the heavy rains, a big breadth of the self yellow Golden Queen Nasturtium is most attractive, and is a fine foil to a lesser breadth of Empress of India (rich crimson) close by. There are some beautiful dwarf Godetias, of which Rosamund (soft rose) is a beauty. Glorioso is an intense rich crimson, and Lady Satin Rose and Whitneyi are intermediate, yet most effective colours. Very fine indeed is the strain of what are termed "Butterfly" Gladioli. These seem to be intermediate between the grandavensis and Lemoinei sections, have large flowers, variously and brilliantly coloured. Summer, Intermediate, and Brömpton Stocks are grown in immense quantities.

Asters, all sown in the open ground, are later,

but will give a very fine show presently. So, too, will *Helichrysum*, *Marigolds*, and various other annuals. Amidst several rows of the Sweet Alyssum it was not possible to fail to notice one of the compact *Konigsmaritim compactum*, 3 inches high, forming dense cushions of white flowers, perhaps the most perfect summer carpet plant to be found. Pansies, *Polyanthuses*, and many other hardy things on trial are there also. Carnations from seed sown at this time last year have flowered, and still are flowering profusely, and carrying large double flowers. To see all that is growing in such trial grounds they need to be visited often.

CYPRIPEDIUM × ULTOR.

IN your issue of the 25th ult., page 69, you record my new hybrid, *Cypripedium × Ultor*, which gained an award of merit from the Orchid committee at their meeting on the 21st ult. I now have pleasure in enclosing you a photograph of the flower-spike of this plant, hoping you may consider it worthy of reproduction in your pages. I notice in your issue of February 3, 1900, an interesting article on *Cypripedium sanderianum* hybrids, in which an illustration of *Cypripedium × sanderiano-Curtisii* is given. Probably an illustration of *Cypripedium × Ultor* would prove interesting to your readers. I keep a very strict record of my hybridizing operations, and so am able to append full particulars of this hybrid. It is as follows: *C. lawrenceanum × C. sanderianum*, raised in the collection of Mr. Reginald Young (gardener, Thos. J. Poyntz), Sefton Park, Liverpool; crossed, May 29, 1894; seed sown, January 8, 1895; seedlings discovered, December 10, 1895; first flower open, July, 1903.

REGINALD YOUNG.

Linnet Lane, Sefton Park, Liverpool.

NOTES FROM SCOTLAND.

PHLOXES.

LATE white Phloxes are among the most valuable plants for northern gardens, and of these the newer dwarf forms are by no means so good as tall plants. The proper way is, no doubt, to plant all sections, the beauty of the dwarf *Tapis Blanc* being sufficient to ensure a liking for it in any garden. At the same time it is not such an effective plant as the now very old *Bridesmaid*, with its tall habit and loose spikes. There is another variety equally tall, very late in flowering, with starry flowers, but which I suppose is to be found in comparatively few gardens, that is one of our best late flowering plants. Each of these is so distinct that they might be regarded almost as different species. In selecting a white Phlox it is wise to choose those with yellow eyes, as then you get the full effect of the white. I was greatly taken with *Phlox Le Mahdi*, one of those purplish tinged forms that have been so prevalent of late years. Until this season it has been disappointing, however, but a group now in flower shows that wherever the fault formerly lay it was not in the variety itself. The plant is of medium height, with flowers to please the most fastidious. Plum-coloured Phloxes are also effective, but in these, as well as the rose-coloured section, one should see the flower before purchasing. Of

HARDY BORDER PLANTS

at present in flower, *Aconitum autumnale* is pre-eminent for its bold habit and for the grand effect made by its spikes of deep blue. It is commonly seen as an over-grown plant tied with severe formality to a support, but to have it in its best form, when it is a characteristic plant, strong two year old crowns should be planted together, not too thickly in large masses, intervening spaces being, however, filled with some dwarfier subject. I have seen this *Aconite* very fine in cold localities as late as October. Even in forward situations it

lasts until that month, but then the side shoots only are left, and of course much of its fascination rests in the glorious main spike. I wonder if

HYPERICUM ELATUM is a popular shrub. If not, it well deserves to be so. At present the bush is covered with its pretty yellow flowers, and in winter berries replace these. The plant, unfortunately, is apt to get cut down by severe frosts, and in cold districts it may on that account be somewhat too tender to prove reliable. *Hypericum* generally are a race that might be more cultivated. Even our native species are not without beauty, and masses and lines of *H. calycinum*, the Rose of Sharon of gardeners, are at present in rare beauty, and will continue so into winter. The rule is that this plant is dowdy and innocent of bloom. Give it, however, a good soil, plenty of sun—for though it lives in the shade it appreciates sunshine—and cut the stem back each year in March, the result will be satisfactory.

A SWEET PEA YEAR.

This may be said to be a Sweet Pea year, the individual flowers have been so large, and the colours so brilliant, fresh, and lasting. A decided forward step has, moreover, been effected in the varieties recently distributed, Lord Rosebery being by far the most beautiful of the many rose-coloured varieties.

Then in King Edward VII. we have a crimson of the ignea type that eclipses even *Salopian*. Of several whites Dorothy Eckford is easily first, though it must be confessed the flower is perhaps not so white as some others. Miss Willmott is, of course, still unsurpassed. Mrs. W. P. Wright has come mixed with me, but all the shades are good. For vase filling *Gracie Greenwood* is invaluable. I think that these varieties will hold a prominent position for some years to come. They may, indeed, be called forerunners of an advanced type. Not the least valuable trait in our present day Sweet Pea is the certain way it responds to what one might term treatment encumbered with difficulties. Mr. Maldom of Duns, a cold locality, wrote me last April that he had these Peas in bloom that were sown in pots the previous September. R. P. B.

GARDENING OF THE WEEK.

INDOOR GARDEN.

MALMAISON CARNATIONS.

BY this time the general stock will be passing out of flower, therefore select from those layered last season sufficient healthy plants for potting on into 8-inch and 9-inch pots. These plants will produce the finest flowers for spring and summer display next season. Select some sound not too light friable loam, but containing

CYPRIPEDIUM × ULTOR.

a good proportion of fibre such as is found only in very old pastures or commons. This must be broken up into pieces the size of a hen's egg, discarding all the fine particles. Also get leaf-soil from Oak or Beech leaves collected last winter. A little peat may be added should the loam be considered too heavy. Mix together in the proportion two parts loam, one of leaf-soil, and one of peat if required. An 8-inch potful of Bentley's Carnation manure and half the quantity of bone-meal to a barrow load of soil, together with sufficient coarse silver sand and broken charcoal to render the whole porous. Use clean pots well drained and 2 inches larger in diameter than those the plants are turned out of. Remove the old drainage and any loose soil there may be from the ball, and also carefully free the roots around the upper part of the ball with a pointed stick. Pot them firmly, and a little lower in the pot than they were before, using a blunt ended stick to get the soil firm enough. After potting place the plants in a cold house, keeping the doors and all ventilators open, except in very stormy weather, and should bright sun intervene a light shading will be beneficial for two or three weeks. The plants must be restaked, as it is desirable to keep every shoot possible. Syringe them morning and evening, but not too heavily, and keep them rather on the dry side at the root. The young layers recently potted up into 3-inch or 4-inch pots should now have plenty of air and room, and the strongest of them transferred to 6-inch or 7-inch pots. Keep all young plants close to the glass and ventilate the house or pit freely. The lights should be taken completely off the

latter in fine weather. See that each plant is supported by a stake 8 inches or 10 inches higher than the plant, and inure them gradually to the full sun.

CALLA ELLIOTIANA AND VARIETIES.

These should be exposed to all the sun and have moisture at the root gradually withheld with the view to thoroughly ripening them. A cold house or pit is much to be preferred to the ash border at this time of the year. As leaf growth is suspended report those that require it into a larger pot. A soil of sound loam two parts, leaf-soil and dry cow manure passed through a fine sieve half a part each, with sufficient coarse drift sand and charcoal to keep the soil open will make a good compost for them. One moderate watering after the repotting will be sufficient, and as the plants become quite dry and all the foliage has disappeared store them away for the winter, either under the stage of a cool house or in a dry shed, where the temperature will not frequently fall below 36° during winter.

PERSIAN CYCLAMENS.

Where a special strain of these is grown, collect the seeds as they ripen, and if sown as soon as gathered almost every seed will germinate under the most ordinary conditions.

Wendover.

J. JAKES.

FLOWER GARDEN.

ROSES.

THE heavy rains of late, followed by warm weather, have encouraged the late autumn blooms; in fact, both Hybrid Perpetuals and Teas are still almost as full of beauty as during the latter part of June. The change of weather from hot and dry to wet and cold for a period of two or three weeks brought on mildew in some places, but the new growths now forming are but little attacked. Those who wish to grow Roses without mildew should try the various forms of *Rosa rugosa*. None are more constant or certain to please than these; they are never troubled with mildew or red rust, two of the worst enemies of the garden. *R. wichuraiana* is also quite proof against mildew and rust. This charming little Rose is now at its best. The white single flowers are very pretty, and show up well against the dark green foliage; it is of a creeping habit, and deserves a place in every garden. Constant stirring of the soil should now be attended to, the recent heavy rains having beaten down the soil more firmly than many of us imagine, and it is at all times beneficial to keep the top soil loose and open to the atmospheric influence. Even where the plants are mulched between with short manure I would prefer them to be worked among as far as possible. Now is a good time to strike cuttings. After the rains, with the ground warm and genial, success is almost assured. The cuttings should be placed on the partially shaded side of a hedge or fence, using wood that is quite half ripe, and insert it three parts of its length. A light porous soil is best, but one of a heavy nature may be used. In this case a little sand or worn-out potting soil should be placed at the base of the cuttings. These will root at once, and be practically established before winter.

PHLOXES.

For mixed borders and shrubberies the perennial Phlox is very ornamental. The varieties are easily increased by divisions in the spring, and also by cuttings. Now is the best time to propagate these; they strike freely under a hand glass in sandy soil, and every point will root. Plants struck now will be ready for transplanting in early spring. The flowers and panicles of these are much finer from young plants, and when grown on light dry soil last much longer in bloom.

IBERIS (CANDYTURT).

For masses of white flowers in the spring garden the more compact-growing species are invaluable. They may be raised from seed or cuttings, the latter being the better way. The best time to take cuttings is when the young shoots of the season are nearly full grown and are becoming firm. These will strike freely under hand glasses or in a cold

frame, and will make good plants by the ensuing spring.

CAMPANULA PYRAMIDALIS.

This fine old plant, known as the Chimney Bell-flower, is now making a grand show in the open borders. Seed sown early in the spring will now give nice plants for potting up, the most suitable soil being a mixture of half sandy loam, quarter road grit, and a quarter leaf-mould. They suffer more from excessive moisture than from drought. During winter the pots should be plunged to their rims in cold ashes or dry leaves, and the rain warded off with old garden lights. The plants may be planted out by the end of May or early in June, and most of them will flower through August and September. Surplus plants should be put out in various positions among shrubs or on sheltered rookeries. In the latter position they are at home, as they like the elevation, and it is surprising how very little soil they manage to exist in.

T. B. FIELD.

Ashwellthorpe Gardens, Norwich.

FRUIT GARDEN.

VINES.

HOUSES of late Grapes intended for keeping through the winter will now require to be freely ventilated with gentle fire-heat in order to secure perfect ripening of the fruit and wood by the end of September. Reduce strong laterals where they have been allowed to run to a considerable length, but at the same time guard against exposing the bunches to the sun, as black Grapes always colour best under a canopy of good foliage. Black Morocco and Madresfield Court Muscat, two varieties liable to crack if heavily watered or allowed to hang in a damp stagnant atmosphere, should be heavily mulched to prevent the escape of moisture from the borders. An impression prevails with some growers that their success this season is entirely due to the extension of laterals, but several fine examples of this noble Grape have come under our notice. We have found upon enquiry that they have been grown upon the close stopping principle, a fair proof that the secret of success must be sought for in the management of the roots and the maintenance of a circulation of a dry warm air. Muscat Grapes now quite ripe must be closely watched, and if necessary slightly shaded with Haythorn's hexagon netting through the hottest part of the day. If the roots are in outside borders some covering should be held in readiness for throwing off heavy falls of rain. Gradually reduce the temperature of the house, using no more fire-heat than is absolutely necessary to prevent the berries damping, and ventilate freely on fine days. Follow up the relaying of the roots of early and midseason Vines before the leaves fall. Keep them well to the surface, and encourage the formation of new spongioles, by syringing and shutting up with sun-heat on fine afternoons. In cold, unfavourable situations Vines should always have the run of inside as well as outside borders, which should be well concreted and drained. Use new turf, with an admixture of old lime rubble, crushed bones, and burnt earth. Apply manure as a mulching in preference to mixing it with the compost, and aim at narrow borders well filled with roots, which can be easily protected or excited, as circumstances may dictate. Always bear in mind that Grapes invariably set and colour best when under control of the cultivator.

STRAWBERRIES.

By this time the latest plants will have become established in their fruiting pots, and the most important point will be to form plump ripe crowns with plenty of healthy roots under them for forcing up the flower-stems in spring. In low, damp situations, more favourable to the growth than to the ripening of the crowns, medium-sized pots, which quickly become filled with roots, answer best, and when this stage has been reached raise them on planks, dwarf walls, or platforms 1 foot or more above the ground, where by full exposure to light and air, and careful attention to watering with water which has been for some time exposed

to the influence of the atmosphere, the most backward plants may be made fit for storing in cold pits by the end of October. Keep the general stock of plants free from weeds and runners, and move them occasionally to prevent the crock roots from striking into the ground. Also keep a sharp look-out for worms, red spider, and mildew. The best remedy for the removal of the first is clear lime water, and the others may be destroyed by dipping the leaves of the plants in a mixture of sulphur and water. If very early forcing is contemplated, the first batch of *Vicomtesse Hélicarte* de Thury and *La Grosse Sucrée*, which is equally early and produces finer fruit, may now be taken to an open airy situation, where they can be partially plunged for the better protection of the roots, which should now be almost forcing the balls out of the small pots, as well as to economise time in watering. If not already done, get the surplus runners planted out on good ground conveniently situated for water. Mulch and encourage a vigorous growth, as these plants will give the earliest runners for next year's forcing, for main crops relying upon *Royal Sovereign* and the *Burghley* var. of *President*. If a spare cold pit can be planted out with *Sovereign* in rich soil the very finest possible fruit can be got at a minimum of cost and trouble just at the best time.

Madresfield Court.

W. CRUMP.

KITCHEN GARDEN.

CARDOONS.

THE plants will now be ready for banding and earthing up. Haybands answer as well as anything, and after making the end fast at the base of the plant, it should be wound round it and upwards until the desired length that it is intended to blanch is obtained. If the plants are not yet fully grown the work should be spread over two operations at intervals of a few days.

THINNING WINTER CROPS.

The importance of thinning out all seedling vegetables in good time cannot be over-estimated, and more especially is it necessary to perform this work as soon as the plants are large enough of those that are to stand the winter. The reason for this is obvious, viz., the hardier and more sturdy the plants are the better will they stand the winter. Unless the plants stand away from each other from the commencement of growth they will quickly become drawn and tender. Spinach, Turnips, and Onions should have early attention, as should seedlings that are raised in beds for transplanting, in order to prepare them before putting out into permanent quarters or to remain where they are sown.

WINTER SALADS.

In many establishments salads are in almost daily request throughout the year, and during the summer and early autumn months it is comparatively easy to maintain the supply, but not so in the dull short winter days. Preparations should be made for lifting and housing Lettuce and Endive so that they re-establish themselves before winter. Large plants are essential for this, and they should be lifted with good balls of soil, and transplanted or bedded 6 inches apart in rough frames or pits. Give one good watering at the roots when the work is completed, and no more will then be required for a considerable time. Leave the lights off on fine days and nights, replacing them only to throw off rains and sharp frosts. Now is a good time to insert cuttings of *Watercress* for providing strong plants for winter. If kept close and shaded roots are quickly emitted, when the points should be pinched out and the plants stood in a cool and shaded spot in the open until frosts occur, when remove them to a light position in pits or cool houses. Insert the cuttings thickly in 6-inch pots filled with common garden soil, taking care to leave plenty of room for abundant supplies of water.

POTATOES.

All the early and second early varieties should be lifted by now and stored before they become diseased. If it is intended to save seed some

suitable sized tubers should be left upon the ground until they become quite green and dry, when they should be laid out thinly in a cool shed for the winter. The edible tubers may be stored when quite dry in the Potato shed, and kept covered with sweet litter or old mats. The late sorts are looking remarkably well, especially that fine variety Up-to-date, which thrives well with us. The recent heavy rains are benefitting them considerably, and provided we now have some warmer weather the crop should be a good and heavy one.

Stoneleigh Abbey Gardens. H. T. MARTIN.

CHRYSANTHEMUMS.

THESE look remarkably well this season, and if we get a good sunny autumn to properly mature the wood very fine flowers may be expected, particularly of the Incurved section, as these flowers always develop more kindly when the wood is not over-ripened early in the year. At this date the whole of the buds in the large flowering section required for the early and middle part of November should be secured, also any varieties which are only just beginning to form and are required for the time mentioned should be placed in a cool, light, airy green or fruit house, raising the points of the growths as near the glass as possible. This will make quite ten days difference in the time of flowering. Mme. Carnot and its sports are always best when treated in this way, and finely-developed flowers can rarely be ensured in the early days of November unless treated as advised, and the same applies to many of the late-flowering Incurved, such as Princess Teck and its family. These, though seldom now seen in the high state of perfection as they were a few years ago, are invaluable to the exhibitor when at their best, as they constitute a true type of the Incurved, and their worth is sure to be taken into consideration by good judges.

RETARDING EARLY BUDS

is also of the utmost importance, as every endeavour should be made to have the collection specially grown in the pink of condition for the dates required, and much may be done to keep back the earlier set buds by placing the plants under temporary erected lights under a north wall, which should be made absolutely drip proof with a free circulation of air day and night. Avoid overcrowding the plants, and when in this position very little water will be required. In no case should any plants remain in the open when the buds show signs of expanding, as these rarely escape damage and perfect their flowers. Though this may not be noticeable for some time, it is almost certain to appear, even when the bloom is half expanded, especially among highly-fed plants.

FEEDING.

This must be done with extreme care. As I have before frequently pointed out, this is often indulged in to too great an extent, especially so immediately after the plants have been disbudded, without resulting in coarse, unrefined blooms. Thin out the plants if space will allow to at least 15 inches or 18 inches apart, and take care to ensure the safety of each growth and flower-bud against wind.

Thoroughly syringe the plants with tepid water about four o'clock in the afternoon, and on very hot, bright days two or three times during the day. This, with the heavy dews which we experience at this time of year, does much in assisting the buds to swell properly. Mildew is

likely to be very troublesome this year, and every precaution should be taken to check it on its first appearance, or, better still, to use the well-known remedy, plenty of sulphur, to prevent its appearance, puffing it well on the underside of the foliage. Should rust put in its appearance use every means to exterminate it. I know of nothing better than weak paraffin and water well mixed and constantly applied to prevent it gaining headway. I have tried this with the best possible results.

EARWIGS.

Trap earwigs and destroy them as previously advised, and also search for them with a lamp during evening. When Bamboo canes are used these should be cut off at a joint or thoroughly plugged, or these will form capital hiding places for them, from whence they come forth in the dark and do considerable mischief both to the bud and flower.

Pompons and late-flowering varieties grown in bush form must have their growths supported as they require it, neatly looping up each to one stout

THE NEW PEACH PEREGRINE. (Natural size.)
(Given an award of merit at the last meeting of the Royal Horticultural Society.
Shown by the raisers, Messrs. Rivers and Son, Sawbridgeworth.)

stick in the centre. Allow the plants plenty of room so that an abundance of sun and light can reach them. These will require plenty of manure water now that the pots are well filled with roots. The Pompons and Pompon Anemones will require a moderate amount of disbudding, which should be judiciously carried out.

THE FRUIT GARDEN.

PEACH PEREGRINE.

WE are pleased to illustrate this Peach by a drawing showing its natural size. As mentioned in THE GARDEN of last week, pages 126 and 142, it is a superb fruit raised by Messrs. Rivers and Son of Sawbridgeworth. The fruit is of beautiful colouring, a warm crimson, and the flavour is

delicious, rich, melting, and quite unlike the watery insipid quality of many of the American sorts. Peregrine is a Peach for all gardens. It bears abundantly, forces well, offers no great cultural difficulties, and is very hardy. Other Peaches possess all these virtues but one, and that is flavour. It is fruit of luscious quality that we desire, and no one can grumble that Peregrine has not this in its fulness.

LATE GOOSEBERRIES ON NORTH WALLS.

It is sometimes difficult to get the best results from a north wall. So far I have found that few trees give a better return than the Gooseberry, and as the tree can be grown readily with little labour I may say that it is most profitable. Many bare spaces could be given to the trees. I do not say that other fruits are less valuable, as much depends upon variety and space at command. The Gooseberry as a double cordon does well on a wall, and I have grown single cordons, but this adds to expense at the start. When the trees are given good soil and food at the start they soon cover a large space. Double cordons or trees trained with, say, half a dozen leaders soon fill a good space. Another point is that when the Gooseberry is grown on a wall it is much later, coming in when others are over. Even when ripe the fruit keeps a long time, and when grown in this way it is easy to protect the fruits with netting. There are other advantages, such as easy gathering of the fruits, which are usually much finer. Once the wall space is covered there is little trouble in pruning. Merely spur back the shoots and occasionally thin them out here and there.

A VALUABLE LATE CHERRY, LATE DUKE.

Cherries in the south and western counties have suffered so much by the bad weather experienced earlier in the season that any one variety that was saved from the wreck is doubly valuable. I never recollect Late Duke failing. Though it varies in adverse seasons, there is usually a fair crop when others fail. It does not possess the same good quality as May Duke, but if the fruit is allowed to hang on the trees when ripe it is by no means inferior; many like its slightly acid flavour, and for tarts and preserves it beats the Morello. The fruits are large, the tree grows well, and is less subject to canker than some dessert varieties. With us on a light soil it is most reliable, and even in seasons of

abundance Late Duke is always valued for its keeping properties, as the fruits hang well into September. Being so productive the tree is most useful when earlier sorts are over. I have also grown it as a bush or dwarf standard, but grown thus it is more difficult to preserve from birds. It is well worth wall space in any garden.

STRAWBERRY TRAFALGAR.

This late Strawberry crops enormously and is a good grower, and this is peculiar, as Messrs. Laxton, who sent out Trafalgar in 1900, give Latest of All and Frogmore Late Pine as the parents. With me Latest of All is by no means a strong grower, though the fruits are of excellent quality. They are conical in shape, and the flesh is firm, sweet, and luscious. This year we have a lot of plants on a north border, and it was so good that we shall grow it more largely in future. The plant makes a free and compact growth, and the foliage is large, smooth, and free from mildew. Owing to its heavy crop it should have more space, as the fruit trusses are large and very heavy, and in wet seasons the big leaves prevent the sun from

reaching the fruits if at all crowded. Trafalgar will, I think, prove one of the best of the newer introductions.

NECTARINE EARLY RIVERS AND THE SEASON.

This Nectarine has been so good of recent years that I am sorry to see that it has quite failed this season, and in a few instances whole trees have been killed by the severe weather of early May. It would be interesting to know how this valuable new Nectarine has behaved generally, as owing to its earliness, size, and flavour a large number of trees must have been planted in various parts of the country. Another point that should not be lost sight of is that both the Peach and Nectarine last autumn made a late growth, and the wood was softer than usual. Early in May the growth of these trees was very forward, and it is possible that earlier varieties felt the severe weather more acutely. Most of the early American Peaches were damaged badly, and the early Rivers suffered in the same way, being on a south-west wall and close to the water in a low lying garden. I intend to replant this variety again; it is too good to omit, and it may have suffered more than in other places, as we registered 17° of frost at the date named.

G. WYTHES.

OUR PUBLIC GARDENS.

NOTES FROM HAMPTON COURT.

So far the heavy and all too frequent rains of the summer have had no ill effect on the famous and beautiful gardens here. The chief defect, if any, is seen in the lack of growth of a few tender plants used for carpeting, especially the variegated *Mesembryanthemum* and *Leucophyton Browni*, things that like ample warmth; but the soil is very porous, moisture soon percolates away, and generally there is little evidence of excessive rain. One special product of the rains is seen in the delightful greenness of the lawns, which, by persistent rolling and mowing, have now become very firm and smooth and clean. It is a singularly enjoyable feature which visitors highly appreciate, and constitutes for all the wealth of floral decoration on every hand a fitting framework or setting. Without showing painful tidiness every part is neat, clean, and all that a well-kept garden should be.

Water Lilies.—The newest feature in these gardens, and one that proves to be an immense attraction, is the many *Nymphaeas* which Mr. Gardiner has so effectively introduced into the large fountain basin. Always a very bold feature, the sixty or so of fine plants now growing and flowering constitute not only a great novelty but also a charming feature. The varieties are many, and of the best. As the roots become stronger each year the water will gradually become well furnished. The fountain pipes are far from being ornamental, and if these could be replaced in summer with a fine group of tall Palms, Ferns, or other appropriate foliage, and a score or so of similar but bushy plants in tubs were placed round on the broad bare stone margin, the effect then produced would be remarkably beautiful.

The Long Border.—Few gardens in the kingdom can show such a wealth of flowers on a side border as can now be seen on that long but all too narrow border which extends from the high road to the river front, excepting the palace façade. This is just now in great beauty, the bulk of its planting being in clumps or blocks of diverse plants, with climbers, Hollyhocks, Hemps, and various good tall plants at the back. Here hardy and tender plants combine with fine effect. Perennial Phloxes are huge clumps, and of rich colours. Hollyhocks are fine, and clean masses of *Lilium Harrisii*, *Bouvardia Humboldtii*, purple, rose, and scarlet *Salvias*, *Snappedragons*, *Pentstemons*, *Hydrangea paniculata*, *Gypsophilas*, *Kalosanthes*, *Aloucas*, white and red *Fuchsias*, also of zonal

Pelargoniums, *Chrysanthemum latifolium*, *Princess Henry*, a veritable giant *Marguerite*, *Gazania splendens*, blue *Veronicas*, white *Millefoils*, and many other things, all showing how to plant flower borders boldly.

Fuchsias and Heliotropes.—Of the *Fuchsias* planted in quantity here none is more effective than the old red and white single *Mme. Cornelissen*, introduced so many years ago, and still the best for bedding. It is here on plants 3 feet to 3½ feet in height literally a mass of bloom. Because of its freedom to flower it makes slow growth. Another very free flowering variety, chiefly in the form of semi-standards, is the red self *Marinka*; this on a floor of white *Bouvardias* is very effective. There are other varieties, but these two are the best. *Heliotrope President Garfield*, in tall, broad bushy plants full of bloom is pleasing intermixed with *Streptosolen Jamesoni*, plants that, by the by, want to be 12 inches taller than the *Heliotropes* are, though prettiest are tall plants of the white *Swainsonia*, which show with good effect above the dark *Heliotrope*. Other tall flowering plants largely used are *Plumbagos* and *Cannas*. Of the latter *President*

describe one tithe of the bedding. A visit reveals all, and is an education in floral decoration.

A. D.

SOCIETIES.

NATIONAL CARNATION AND PICOTEE NORTHERN DIVISION.

THIS exhibition was held in the large show house of the Manchester Royal Botanical and Horticultural Society on the 15th inst., and proved a great success, but unfortunately the weather being bad the attendance was very thin. The exhibits as a whole were fully up to the average, and in many cases exceptionally fine stands were put up.

For twelve bizarres and flakes, white grounds, dissimilar, Mr. T. Lord, Todmorden, secured the leading prize with fine blooms of J. S. Hedderly, Geo. Melville, Master Fred, Arline, Sportsman, Admiral Curzon, Gordon Lewis, Mrs. Shaw, Sarah Payne, Miss Constance Graham, and C. F. Thurston; Mr. J. W. Bentley, Stakehill, was second, his best blooms being Pandora, Arline, Sportsman, &c.; Mr. T. Etherington, Middleton, Junction, third.

For six varieties, Mr. J. Edwards, Moston, was first, having Pandora, J. D. Hextall, R. Houlgrave, Gordon Lewis, C. F. Thurston, and Sarah Payne; Mr. T. Brocklehurst, Marple, second, with Othello and G. Melville; Mr. W. Curbstone, Heaton Moor, third.

For twelve Picotees, white grounds, dissimilar, Mr. C. F.

A BED OF GALTANIA CANDICANS IN THE GARDENS AT HAMPTON COURT PALACE.

Faure, with its deep maroon foliage, is very striking intermixed with silver variegated *Abutilons*.

Begonias, &c.—The most brilliant colour bed is one near the river front. It is planted with *Begonia Lafayette*, the very best and most effective double ever introduced. Mr. Gardiner mentioned that whilst some complained that they could not make this variety grow he found no difficulty in doing so, as his superb plants attest. It has, in fact, been too much coddled in heat. The plants are thinly placed on a carpet of *Fuchsia Meteor*, whilst here and there are dotted plants, 20 inches to 24 inches in height, of the silvery *Fuchsia Gracilis*, small variegated *Abutilons*, and *Chlorophytums*. This glorious bed is worth going miles to see. Another bed of dark-coloured *Begonias*, planted thinly on a carpet of Sweet Alyssum, is dotted with fine balloon-shaped plants of the new *Kochia Scoparia*, that attract so much notice intermixed. Apricot and golden *Begonias* also are very effective. *Verbena Ellen Willmott* is used to produce a fine mass of pink colour. The old species, *Verbena venosa* and *Erinicoidea alba*, with tall plants of variegated *Veronica*, make a pretty combination. But it is impossible to

Thurston, Wolverhampton, first, with fresh flowers of W. H. Johnson, Pride of Leyton, Mrs. Holden, Ganymede, Little Phil, Mrs. Gorton, Mrs. Openshaw, Favourite, Brunette, Henry Kenyon, Thos. Williams, and Lady Louise; second, Mr. A. R. Brown, Birmingham; third, Mr. T. Lord.

For six varieties, Mr. J. Edwards was first; the Rev. C. Gottwalt, Drottwich, second; Mr. J. W. Bentley third.

For twelve selfs, not more than two flowers of one variety: First, Mr. A. R. Brown, with strong blooms of Avalanche, Bomba, Snowdrop, Teddy Galton, Cadet, Jenny Gough, Agnes Sarrill, Miss Alley, Snowdrift, Richard Dean, Germania, and Sir Bevy; second, Mr. C. F. Thurston, with Isinglass, Orpheus, and Miss Eric Hambro; third, Mr. T. Lord.

For six varieties: First, the Rev. C. Gottwalt, with fine flowers; second, Mr. W. Curbstone; third, Mr. D. Walker.

For twelve fancy or yellow ground Carnations of 2000s, not more than two flowers of one variety: First, Mr. C. F. Thurston, with a grand lot; second, Mr. A. R. Brown; third, Mr. T. Lord.

For six fancies: First, Mr. D. Walker, with H. Falkland, Gronow, Helios, Charles Martel, Paladin, and Erith; second, the Rev. C. Gottwalt; third, Mr. W. Curbstone.

Carnations, single blooms, scarlet bizarre: First and fifth, Mr. C. F. Thurston, with R. Houlgrave; second and third, Mr. J. Edwards, with Admiral Curzon and R. Houlgrave; fourth, Mr. C. F. Budenberg, with R. Houlgrave. Crimson bizarre: First and second, Mr. T. Lord, with Master Fred and J. T. Hedderly; third, Mr. J. Edwards, with C. F. Thurston; fourth, Mr. A. R. Brown, with J. S. Hedderly; fifth, Mr. C. F. Thurston with the same kind. Pink and purple bizarre: First and second, Mr. T. Lord, with Sarah Payne; third, Mr. J. Edwards, with the same kind; fourth and fifth, Mr. A. R. Brown, with George Rudd. Scarlet

Snake: Mr. C. F. Thurston; third and fourth, Mr. T. Lord, with Sportsman in each case; fifth, Mr. A. E. Brown, with Guardamans. **Rose snake:** First and second, Mr. C. F. Thurston, with Mrs. Rowan and Mr. T. Lord; third and fourth, Mr. T. Lord, with his namesake; fifth, Mr. J. Brocklehurst, the same variety. **Purple snake:** First, Mr. T. Lord; second and third, Mr. C. F. Thurston; fourth, Mr. W. Carstone, all staging Gordon Lewis; fifth, Mr. A. E. Brown, with Gordian Melville.

PICOTEES.

For single blooms, heavy red edge: First, Mr. T. Lord, with John Smith; second and fourth, Mr. A. R. Brown, with Brunette and Beatie; third, Mr. C. F. Thurston, with Brunette; fifth, Mr. J. Edwards, with Mrs. C. H. Hardman. **Light red edge:** First and third, Mr. C. F. Thurston, with Mrs. Gorton and Thomas Williams; second, Rev. C. Gottwaltz, with Thomas Williams; fourth and fifth, Mr. E. Kenyon, with Mrs. Gorton and Thomas Williams. **Heavy purple edge:** First and fourth, Mr. J. Edwards, with Mrs. Openshaw; second, Mr. C. F. Thurston, with the same kind; third, Mr. E. Kenyon, with Muriel; fifth, Mr. A. R. Brown, with Fanny Fett. **Light purple edge:** First and fifth, Mr. A. R. Brown, with Pride of Leyton and Myra; second and fourth, the Rev. C. Gottwaltz, the same varieties; third, Mr. C. F. Thurston, with Pride of Leyton. **Heavy rose, scarlet, or salmon edge:** First, Mr. A. R. Brown, with Mrs. Payne; second, the Rev. C. Gottwaltz, with Louie; third and fourth, Mr. E. Kenyon, with Mrs. Holden; fifth, Mr. T. Lord, with Campana. **Light rose, scarlet, or salmon edge:** First and fifth, Mr. A. R. Brown, with Lucy; second and fourth, Mr. T. Lord, with Fortrose and Favourite; third, Mr. C. F. Thurston, with Nellie.

PREMIER BLOOMS.

Picotee: Mr. A. R. Brown, with a charming white ground purple edge Myra. **Carnation:** Mr. J. Edwards, with J. D. Marshall, crimson bizarre.

CERTIFICATES.

The following awards were made: The Rev. C. Gottwaltz for Myra, as above, and for Lucy, a light scarlet-edged Picotee. Mr. B. Simmonite, Sheffield, for Aurora, a heavy edged variety.

The courteous hon. secretary and treasurer, Mr. W. Prosser, carried out the details in the most satisfactory manner.

CARDIFF GARDENERS' ASSOCIATION.

ANNUAL OUTING.

The annual outing of members took place on Monday, the 18th inst., when a party of nearly fifty journeyed to The Hendre, Monmouth, the beautiful residence of Lord Llangatlock. Leaving Cardiff in saloon carriages at 8.30, the party reached Abergavenny at 11.10, where a start was made for the Swan Hotel. At 12 noon a splendid dinner was served. Mr. F. G. Treseder, F.R.H.S., N.D.S., occupied the chair. The toast list was of a very brief nature, owing to the limited time.

The health of "The President" (J. Lynn Thomas, Esq., C.B., F.R.C.S., J.P.) was proposed by Mr. H. R. Farmer, chairman of the association. Owing to the unavoidable absence of the president, Mr. Thomas Malpass, head gardener to that gentleman, responded. "The Cardiff Gardeners' Association" was proposed by Mr. C. Phelps, V.P., and responded to by Messrs. H. R. Farmer, T. Malpass, and John Jones. "The Visitors" was proposed by Mr. Thomas Chubb, and responded to by Mr. Roddy. "The Chairman" was proposed by Mr. W. J. Prosser and responded to by Mr. F. G. Treseder.

After the party had been photographed they proceeded in buses to The Hendre, which was reached after a little over two hours' drive through the beautiful and picturesque valley of the Usk. Mr. Thomas Coomber, F.R.H.S., head gardener to his lordship, met the members at the entrance and conducted them over the gardens, where, as usual, everything looked in perfect order. Of the outside crops, Gooseberries and Currants were in abundance, but as Mr. Coomber had told many of the members at our late show, acting as one of the judges there, that he had neither Apples nor Pears. And true it appeared that he must have suffered very severely by the disastrous hailstorms during the spring when the trees were in blossom. The lawns and rockeries were beautiful. By special request the members were photographed in front of the mansion. Here Mr. Coomber introduced the party to the housekeeper, who very courteously showed them the various rooms full of costly works of art.

Tea (which was very generously provided by his lordship) was now served, and thoroughly appreciated after the delightful ramble though a most bracing air. Mr. H. R. Farmer moved a very hearty vote of thanks to the Right Hon. Lord Llangatlock. In the absence of his lordship, Mr. Coomber briefly responded. Mr. J. J. Graham moved a hearty vote of thanks to Mr. Coomber, who, he said, the members felt deeply indebted to, as he had done all that was possible to make the day what it really was—a happy one. Mr. R. Mayne seconded. Mr. Coomber briefly thanked the members for their kind expressions.

The buses were now ready to convey the members back to Abergavenny, thence to the station. Cardiff was reached at 10 p.m. The party unanimously thanked the hon. secretary, who had charge of the arrangements.

TROWBRIDGE HORTICULTURAL SOCIETY.

ONE of the best-known exhibitions in the West of England is that held at Trowbridge, Wiltshire, whose staple industry is the weaving of woollen cloths. Fifty-four years ago the Trowbridge Horticultural Society was formed, and it has held an exhibition annually since. One of the leading commercial families is that of the Stancombs, and a few years ago when Mr. William Stancomb, who was the president of the society, died, he left by will to the society, being lord of the manor, a spacious field in the town,

adjoining the Great Western Railway Station, for the use of the society, conditionally upon a flower show being held at least once in three years, the trustees of the ground being the magistrates for the borough. The annual show was held on the 19th inst., the weather being gloriously fine. There was a very large attendance, excursion trains coming in from many parts, and a sum of nearly £800 was taken at the gates. The town gives itself up to a day's enjoyment, the streets are prettily decorated, a high-class military band is engaged, with a display of fireworks at night.

Stove and greenhouse specimen plants are always well shown by local men, principally by Mr. H. Matthews, gardener to W. J. Mann, Esq., and by two local florists, Messrs. G. Tucker and H. Pocock. There are classes for twelve, six, and three, and some very fine Ericas find their way on to the exhibition stage, as well as Ixoras and Dipladenias, Ferns (finely shown in collections of twelve), tuberous-rooted Begonias (exceptionally fine), zonal Pelargoniums, Coleus, ornamental-foiled plants, and Orchids are always fine features. The glory of Trowbridge is its specimen Fuchsias. The veteran Fuchsia raiser, James Lye, who was for years the champion grower and exhibitor of these plants, was among those who set the fashion of Fuchsia culture in Trowbridge, and several of his disciples follow in his wake. The Trowbridge specimen plants are in 10-inch or 12-inch pots. They are from two to five years in age, 7 feet and 8 feet in height, the branches tied in to some extent so as to economise space in the vans in which they are conveyed, sometimes long distances, for the height of the plants precludes the possibility of their being sent by rail, the foliage finely developed, feathers down over the rim of the pot, hiding it from view, and they are liberally sheathed in blossom. James Lye used to put his plants in the open in May with a slight awning over them to ward off tropical rains, and in this way they were finished off for the exhibition tents, with the exception of Bath and Chippenham, flower shows within easy distance of the centres of cultivation. No such plants are to be seen elsewhere. They are superb examples of cultural skill. The two leading growers in the Trowbridge district are George Tucker and Henry Pocock, and there are two classes for specimens, one for six and one for four. On this occasion Mr. Pocock had the best six, and Mr. G. Tucker the best four. But fine as the Fuchsias were, they lacked the finish we have seen in previous years, owing to the sunless summer. Some of the best exhibition varieties with dark flowers are Doel's Favourite, a free growing and very free blooming dark variety raised some forty years ago; Brilliant, Thomas King, Mr. H. Roberts, Final, and Charming (Lye), the last one of the very best exhibition and decorative Fuchsias yet raised. Light varieties: Lye's Favourite, Lustre, Western Beauty, an extra fine variety, Arabella, and Beauty of Trowbridge.

Of cut flowers Roses were very good, a most attractive and instructive feature being the class for twelve bunches of garden Roses, the prizes going to the following in the order of their names, viz., Messrs. George Cooling and Son, J. Mattock, and Townsend and Son. Dahlias of all types were very good—show, fancy, single, Pompon, and Cactus—several of the leading trade growers competing. Among the Cactus blooms Winsome, a new white of last year, was in very fine character. There were very fine bunches of hardy perennials, while collections of annuals, also in bunches, were delightful. Gladioli, Asters, Carnations, Picotees, Phlox Drummondii, and Sweet Peas were great attractions. Wild flowers, correctly named and in good variety, were also shown, and pretty floral decorations.

Fruit was well shown. Among the dessert Apples Beauty of Bath was remarkably good, and is one of our very best early Apples. Worcester Pearmain and Lady Sudeley were also in good character. The best kitchen Apples were Warner's King, Peasgood's Nonsuch, and Lord Suffield.

Vegetables were very good, and especially so from working men grown in the allotment gardens about Trowbridge. The soil is suitable to the production of clean, bright specimens.

ENGLISH ARBORICULTURAL SOCIETY.

The members of the above society recently visited the establishment of Messrs. Sutton and Sons at Reading. They were received by Mr. Martin H. F. Sutton, and shown over the firm's offices and warehouses, in which they appeared to be much interested. Later in the morning they were conducted to Messrs. Sutton's trial grounds, where they inspected the many thousands of trials of flowers, vegetables, &c., afterwards returning to the firm's offices, where they were again received by the members of the firm, by whom they were entertained to lunch in their private hall. Mr. Martin John Sutton presided, supported by Mr. George Marshall (president of the society), Major F. W. Beadon, Mr. M. H. F. Sutton, Mr. B. Cowan, and Mr. E. Davidson (assistant secretary), the company numbering in all about sixty. The chairman gave the toast of "The King, the Queen, and the Royal Family," mentioning that no man, probably, in the higher walks of life had planted more trees than his Majesty, either as King or as Prince of Wales. The other day the King planted a tree on that wide expanse of treeless turf known as Park Royal, and thus gave it some better claim to its title.

Mr. Sutton next proposed "The English Arboricultural Society," coupled with the name of its president, Mr. Marshall. He expressed the great pleasure which he and the other members of the firm—his brothers, who were unavoidably absent, and his son, who was present—had in welcoming them there that day. He explained the circumstances which made the luncheon somewhat of an impromptu character, and prevented all the members of the firm being there, but assured his guests that no association could be welcomed more warmly than that society.

Mr. George Marshall, in returning thanks, said they had all drunk their own healths very enthusiastically. They had been treated, even at short notice, with the greatest hospitality; what the hospitality would have been had the notice been longer he left them to imagine. He would now propose the health of Mr. Sutton and his son, and of every

member of that world-famed firm. They had received at their hands the greatest courtesy and kindness, had been shown over their huge establishment, and told how a business of that kind should be conducted.

Mr. Martin H. F. Sutton, responding, thanked the company for their kind references to his father, himself, and their firm, and said they appreciated the honour of the society's visit. He was glad to know they were interested in the firm's premises and business methods. If there was one sentence of Mr. Marshall's to which he might demur it was when he said the visitors had seen how the firm conducted their business, because it had taken them (Messrs. Sutton) a considerable number of years to learn it. He was pleased they had been able to see the trial grounds at a season when there are more flowers in bloom than at any other time of the year.

* * The reports of the Brighton and other shows are left over until next week.

LAW.

COVENT GARDEN ARBITRATION CASE.

In the Westminster High Bailiff's Court, on the 12th inst., Mr. John Troutbeck and a special jury had before them the case of Wyld and Robins v. the Great Northern, Piccadilly, and Brompton Railway Company, which was a claim for compensation for the compulsory acquisition of the premises, 19, James Street, Covent Garden, required for the purposes of the new Covent Garden station. Mr. Edward Boyle, K.C., and Mr. Attenborough appeared for the claimants; and Mr. Roskill, K.C., and Mr. Disney represented the promoters. Mr. Boyle said that his clients were market gardeners, and held the premises on a lease, of which thirteen years were unexpired, at a rental of £150 per annum. Covent Garden Market belonged to the Duke of Bedford, who exacted a toll varying from 1d. to 4d. on each package sent in. This property, however, was free of toll, which often amounted to more than the rent. The taking of these premises in 1897 increased the net profits from £1,000 or so a year to an average of £3,537. Their claim was for £9,604. The witness went on to say that about a month or so after he took possession of the James Street premises tolls were demanded of him by the market superintendent, but he refused to pay. It was a common thing to see people in James Street paying the Duke's toll. Mr. Roskill said the Act dealing with the matter was 9 Geo. IV., sec. 113, and applied only to Covent Garden Market. Mr. Boyle said the Duke had it inserted in all his leases that tolls were to be paid. Mr. Robins said the occupiers of stands in Covent Garden Market were under great restrictions. If it rained, and he erected an awning to protect his valuable fruit, he would be ordered to take it down immediately, and he was not allowed to have the telephone; but he had that advantage in James Street, as well as a right to have a telegraphic address. If the railway company could find him other premises he would not ask for compensation. Mr. George Monro, managing director of George Monro, Limited, of 41, King Street, Covent Garden, said they occupied six shops in the market and five warehouses outside, paying the Duke's toll on all. This ranged from 1d. to 4d. The toll on half a bushel of Plums was 1d., whether the value was 1s. or 25s. The tolls more than doubled the rent in some cases. For the railway company Mr. Alexander R. Stenning said the claimants would be amply compensated if they were paid £2,738, and Mr. Douglas Young assessed the value at £2,300. The jury awarded the claimants £5,435.—*The Times*.

OBITUARY.

M. GODEFROY-LEBEUF.

THIS horticulturist, whose name was so well known, has just died at Paris at the age of fifty-one years. Brought up amongst plants at the Museum de Paris, he married the daughter of M. Lebeuf of Argenteuil, and commenced, like his father-in-law, the cultivation of Asparagus. Journeys in Cochin China, however, gave him a passion for introductions, especially for Orchids, which he imported with great ardour. He founded the paper called the *Orchidophile*, of which he was the most important—indeed, practically the only—editor, and which contributed greatly to popularise Orchids in France, and to make known the cultivation. He undertook, with the collaboration of Mr. N. E. Brown of Kew, the publication of a sumptuous work on Cypripediums, but this publication did not meet with the success it merited, and M. Godefroy-Lebeuf was obliged to abandon it. Later he published *Le Jardin*, which he kept for a number of years and then sold. In his later years M. Godefroy-Lebeuf was principally occupied in the introduction and exportation of colonial plants, to which his establishment of Batte-Montmartre was principally consecrated.—*Revue Horticole*.

MRS. LEWIS CASTLE.

We are very sorry to hear that Mr. Lewis Castle, the well-known manager of the Duke of Bedford's

fruit farm, has lost his wife at the early age of forty-two from paralysis, after twelve years of suffering. Mrs. Castle was well known to former Kewites, Mr. Castle having been for many years in the Royal Gardens, and was keenly interested in horticulture and botany, assisting her husband constantly in his horticultural work. A large family mourns her loss.

CHARLES JULES FREDERICK POSTH.

MANY in France and in this country will hear with regret of the death of this kindly horticulturist, a member of the great firm of Vilmorin of Paris. He died after a well-spent life in his seventieth year.

MR. WILLIAM HOUSLEY.

JUST as we are going to press we learn of the death of Mr. William Housley, secretary of the Sheffield Chrysanthemum Society. Mr. Housley was operated on for appendicitis about a month ago, and was going on well, but a relapse ensued, ending in his much-lamented death. Chrysanthemum growers in the North will miss this enthusiastic grower and worker. The funeral took place yesterday.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 90, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of Plants.—H. C. F.—1, *Cedrus atlantica*; 2, *Pinus exelsa*; 3, *Cedrus Deodara*; 4, *Erigeron pulchellus* (caucasicus); 5, probably a *Campanula*, but without leaves or flowers impossible to say; 6, *Lysimachia vulgaris*.—A. James.—1, *Lysimachia thyridiflora*; 2, *Veronica spicata*; 3, *V. a. variegata*; 4, *Agrostemma coronaria alba*. We wish everyone sent such good specimens.—T. F. Daniell.—1, *Phyllis capensis*; 2, *Anthemis tinctoria*; 3, *Geranium pratense* fl. pl.—W. T.—*Silene Armeria*.—V. E. W.—Please send a better specimen, the one sent was not complete enough for correct identification, as the flowers had quite faded.—F. P. K.—*Linaria bipartita alba*.—M. H. Casaret.—1, *Trachelium corniculatum*; 2, *Platyodon grandiflora* (Chinese Bell-flower).—S. G. R.—*Staphylea pinnata*.—G. C.—The leaves are probably those of a species of *Triplaris*, but it is impossible to name without more material. The white seeds are *Cotix Lachryma*, "Job's Tears." The red and black seeds are probably those of a species of *Rhynchosia*. The black seeds we could not identify.—H. J. A.—1, *Sedum spectabile*; 2, *Buddleia globosa*; 3, double variety of *Althea frutescens*; 4, *Corydalis lutea*.—J. M. S. P.—*Centaurea macrocephala*.—T. A. Sturge.—*Olearia Haastii*.—S. H. B.—*Ruscus aculeatus*.—J. R. D.—*Rubus phoenicolasus*.—C. B. M.—The name of the Musk Rose is *Eliza Werry*.

Wooden espaliers.—We have an oblong garden of about two acres, and it is proposed to put wooden espaliers behind the herbaceous borders on centre and principal cross walk. Could you or any of your readers describe one that has proved effective, material, height, distance apart of supports and lathing? Is there any book giving a variety of espaliers?—J. B.

[The simplest method, at once light, durable, and easily fixed, is that of galvanised iron standards with twisted wire passed through. Failing this, we could only suggest Oak posts with the wire above inserted through. The objection to wood laths is that lightness cannot be secured with durability. The posts or standards should be 9 feet apart, and these may be obtained of any of the iron-fencing manufacturers advertising in our columns. The catalogues of these firms would be your best guide. Perhaps some reader can help our correspondent.—ED.]

Alpine house.—Plunging materials (ANXIOUS). Any coarse, sharp sand, macadamised road grit, crushed granite or limestone, or old brick rubble roughly pulverised will make a good plunging material for the purpose. Cocoa fibre may be ranked next to these, but any of the above materials would answer better. We could have advised more fully if "Anxious" had stated whether the alpine were to be more or less permanently grown in the house or in frames, and brought into the house to flower. In the latter case, plunging might be dispensed with, but the

stands should be surfaced with gritty material in order that the pots may stand on a well-drained, though moist surface. All barred stands or shelves should be avoided.

Snappdragons, &c. (A. E. T.).—The earliness or lateness of these and the *Marquette* Carnations to flower depends upon the season, and many things are late this year. Both, however, may be sown in the last week in September and pricked off into boxes and placed into frames for the winter. The drawback to sowing the Carnations too much in advance of their flowering period is the possibility of the plants becoming wiry or stunted, when the flowering period would be much shortened. If you can command a slight warmth and treat the plants quite liberally, so that no check is experienced, a later time than we have given would be best. If, however, you have a contrary experience in your own locality, this should be the better guide. Both may be pricked off when 2 inches high and the point of the Snappdragon removed. These latter may be sown now at any time, inasmuch as repeated stopping of the shoots will render them large and bushy. It would be preferable to prick the young plants off in rich soil in the frame, and here the young plants would quickly develop. The frame will be the best winter place for them.

Lilium tigrinum Fortunel diseased (L. J.).—Yes, it is the Lily disease which has followed an injury by late frosts.

Rose buds failing to open (MRG.).—Although the sunless weather and excessive rainfall would account in part for these buds failing to expand, we cannot help thinking that you have overdone the plants with manure. Newly planted Roses that had the beds well prepared at time of planting certainly did not require artificial and liquid manure in addition. We are convinced this excessive manuring is responsible for much of the mildew troubles that beset the amateur. We should advise you to cut off these buds at once, and there will yet be time for a fine autumnal display, although it will be rather late. This is, of course, supposing the varieties planted are really free bloomers. A dusting with flowers of sulphur will check the mildew, and there will be no danger of injuring any buds such as is possible with liquid remedies.

Sempervivums, &c. (G. BEAUMONT).—The Cobweb Sempervivums are very few in number, and are *S. arachnoideum, *S. a. rubrum, *S. a. Lageri, and *S. Hookeri. The most distinct Sempervivums are S. montanum, S. triste, S. violaceum, *S. Regine Amalae, S. acuminatum, S. calcaratum, S. calcaratum, S. glaucum, S. spinosum, S. Verticill, S. hirtum, S. Pictoril, S. Powell, S. boutignyannum, and S. globiferum. The best Sedums are S. acre aureum, S. arborescens, *S. a. monstrosum, *S. Ewersii, S. dasycarpum, S. fosterianum, S. f. glaucum, S. lydiun, S. Kamtschaticum, *S. K. variegatum, S. populifolium, S. hispanicum, S. h. glaucum, *S. Sieboldii, *S. f. fol. variegata, S. Telephium atropurpureum, and S. asiaticum. All of the above are hardy, and those marked by an asterisk may be grown in a cool greenhouse. The true character, however, is best seen on some rocky and sunny exposure.—E. J.

Isoloma culture (CONSTANT READER).—Isolomas are not at all difficult to cultivate provided they get a reasonable amount of attention. To succeed in their culture they need much the same treatment as the *Gloxinias*, and, like them, they pass the winter in a dormant state. They do not, however, form a solid tuber as *Gloxinias* do, but a creeping caterpillar-like rhizome, after the manner of some of the *Achimenes*. A suitable time to commence the culture of these plants is early in the year, before they start into growth, as they can then readily be sown by pot. Immediately on receipt these rhizomes should be potted in a mixture of equal parts of loam and leaf-mould with a good dash of sand. In potting the soil must not be pressed down too firmly, and the point of the rhizome from whence the future growth is pushed forth should be about half an inch below the surface of the soil. After potting the Isolomas should be placed in an intermediate house and but little water given them till they start into growth, after which they make rapid progress, when more water must, of course, be supplied; indeed, as the pots get well furnished with roots an occasional dose of liquid manure is beneficial. Pots 4 inches in diameter are very suitable for potting the rhizomes at first, then when sufficiently rooted they may be shifted into larger ones, say, 5 inches to 5½ inches in diameter. When plentiful the rhizomes are generally potted triangular wise, three in a pot, and shifted on without being disturbed. In this way larger specimens are formed. They will often flower well on into the autumn, after which the soil must be kept considerably dryer; in fact, throughout the winter just sufficient water should be given to keep the soil very slightly moist, but no more. Then in February turn out of the pots, shake the rhizomes clear of the old soil, and repot according to the instructions above given. Isolomas may be grown fairly well in the warmest part of the greenhouse, but as stated an intermediate temperature is necessary to do them at their best. The name of Isoloma is, botanically speaking, quite correct, but at the same time this group of plants is more generally met with in gardens and nurseries under the generic name of *Tydes*.

Planting rock bed (M. H. G.).—You can scarcely do better than obtain a selection from the following plants, all of which are suitable: *Aubrietias* (any), *Phlox setacea* in several kinds, also *Phlox rostrata*, *P. amena*, *P. divaricata*, &c., *Arnebia echioides*, *Anemone* (Hepatica) in variety, any of the alpine *Dianthus*, **Veronica prostrata*, **V. pectinata*, *Anemone nemorosa*, *A. spennina*, *Adonis vernalis*, *Saxifraga Wallacet*, **S. muscoides atropurpurea*, **S. Rhel*, *S. Guildford Seedling*, *S. cochlearis*, *S. longifolia*, *S. cotyledon*, *S. pyramidalis*, *Megasea* in variety, *Lychnis Viscaria plena*, *Iris pumila*, *I. nudicaule*, *Heuchera sanguinea*, *Gentiana acaulis*, *Campanula muralis*, **C. pumila*, **C. p. alba*, **C. gargarica*, **C. g. alba*, **Alyssum saxatile*, **Zauschneria californica*, **Corydalis thalictroides*, *Vittadenia triloba*, **Thalictrum adiantiforme*, *Thymus lanuginosus*, **Salix herbacea*, **Rubus Arcticus*, *Geothra macrocarpa*, &c. Those marked by an asterisk are suitable for covering the stone edges of the pond. None of the plants enumerated are more than 1 foot high in

flower, excepting *Megasea* and *Heuchera*, but these are worthy subjects by reason of their tufted leaf character. A large number are of somewhat spreading habit. You could vary and extend the flowering season by planting a few bulbs, such as *Iris*, *Snowdrops*, *Snowflakes*, *Daffodils*, &c.

Lady Downe's Grape.—Berries spotted and shrivelling (A. B.).—This undoubtedly is a true case of what is technically known as the Grape "scald." As long as we can remember Lady Downe's has been specially addicted to this malady. The berries are invariably affected during the process of stoning, and this ordeal seems to go harder with Lady Downe's than with any sort we know. Whether it is because the seeds of this variety are usually larger than the seeds of many other varieties we cannot tell, but certain it is that the berries become so sensitive at this time that they are easily injured. The nature and origin of this disease, as far as we know, science as yet has not revealed. Many years ago we suffered as much from this disease as our correspondent, but in later years not at all, and this in consequence of taking the precaution of giving the Lady Downe's vine abundance of air day and night, top and bottom, with lower temperature, for as long as the process of stoning was going on (three weeks or a month), thus giving the vine more time with less strain while passing through this ordeal. This has been a complete cure in our case, and we doubt not it will be with our correspondent.

Plants under trees (LADY JACKSON).—Plants that will grow under the shade of a spreading Cedar of Lebanon are very few, those likely to give the most satisfaction being as follows: *Ivy*: These are indispensable for this purpose, and of them there are many beautiful and distinct varieties. *Periwinkles*: All the forms of the greater and the lesser *Periwinkle* will hold their own under the conditions named. *Hypericum calycinum*: The host of the St. John's Wort for such a situation—*Cotoneaster microphylla* and *C. horizontalis*, the first-named of which is evergreen, and the other deciduous. *Ruscus aculeatus* (Butcher's Broom), *Euonymus radicans*, and *Daphne pontica* can also be recommended. In the case of plants under trees it must be borne in mind that they are by the overhead canopy deprived of a good deal of rain that would fall to their share in the open ground, hence artificial watering will be more necessary than if they were fully exposed.

Rose growth diseased (E. P., Hertford).—We are of opinion that the disease upon the piece of growth sent is what is known as "Rose tumour." You will see it described in the able article on "Fungoid Pests of the Garden," by Dr. Cooke, which appeared in the *Journal of the Royal Horticultural Society*, Vol. XXVII., Part I., published last September. Apparently there is no known cure for this disease, but we should say that it might be prevented by replanting the plants into some new soil. We note you say the plants of Bardon Job from which the piece of wood was taken have not yet been planted two years, and that it is extraordinary to find them making growths 8ft. to 10ft. long. Perhaps you have over-dosed them with some chemical manure. In any case we should advise you to cut these growths back past the places where attacked. It would not be wise to do this just yet if there are many shoots attacked on the one plant, but if only one shoot per plant, the sooner it is done the better. We have known insects to puncture the wood of Rose plants and thereby cause diseased-looking blotches similar to those on your plants, but the enormous growths made by this particular Rose leads us to suppose that the disease is the Rose tumour, caused possibly by over-fertilizing.

Shrubs for buttresses (BRIMSOP).—By far the best of the double-flowered Brambles is the pink form, known generally as *Rubus fruticosus flore rosea*, and occasionally as *R. bellidifolius*, but in the *Kew Hand List* it bears the name of *R. umifolius flore-pleno*. The blue-flowered shrub mentioned in your letter is, we should say, one of the species of *Ceanothus*, perhaps *C. dentatus* or *C. papillosus*, both of which have from small to medium-sized leaves, dark green. Flowers are produced profusely in May and June. Other good subjects for the purpose mentioned are *Azara microphylla*, *Cholera ternata*, *Eucalyptus macrantha*, *E. philippiana*, *Cotoneaster microphylla*, common *Jasmine*, *Jasminum revolutum*, and *Olearia grandis*.

Lilium auratum bulb decaying (ISABEL M. BRUXNOR).—The bulb sent shows no trace of destructive fungoid or other diseases, but has the appearance of having been grown in a soil too wet and heavy during winter. The basal roots have decayed as fast as they were produced, and the discoloured and decaying scale tips show signs of a sour soil during the past winter. A healthy young growth in the middle of the bulb would, in the ordinary course, have developed a flower spike if the condition of the soil admitted. In most cases, and especially in Scotland, it is advisable to grow Lilies amid low-growing shrubs, such as *Asclepias*, &c., whose roots would correct any excess of moisture in the soil. The small "grub" sent is harmful to a degree, but is not responsible for the condition of the bulb sent.

GARDENING APPOINTMENT.

MR. STEWART GRAY, late gardener to Sir E. Lechmere, Bart., Rhidd Court, Worcester, as head gardener to the Right Hon. the Earl of Idlesleigh, Pynes, Exeter, Devon.

CATALOGUES RECEIVED.

Bulbs.—Messrs. Sutton and Sons, Reading; J. Veitch and Sons, Limited, Chelsea; W. Paul and Sons, Nurseries, Waltham Cross; W. Bull and Sons, Chelsea; Cooper, Taber, and Co., Limited, 90 and 92, Southwark St., S.E.; Messrs. Little and Ballantyne, Carlisle.

Bulbs for Early Forcing.—A. Perry, Hardy Plant Farm, Winchmore Hill, London.

* Many contributions to "The Editor's Table" will be noted next week.

* The Yearly Subscription to THE GARDEN is: *Inland*, 15s.; *Foreign*, 17s. 6d.

[SEPTEMBER 5, 1903.]

DAHLIA FANCIES.

DISAPPEARANCE OF THE OLD DECORATIVE DAHLIAS.

ON Tuesday and Wednesday the Drill Hall, Westminster, where the Royal Horticultural Society hold its fortnightly meetings, was filled with a beautiful display of Dahlias of all classes. The occasion was the annual exhibition of the Dahlia Society. A careful look round was convincing evidence of the almost total disappearance of the older decorative sorts with wide flat petals.

This is extremely regrettable, as it is just these wide-petalled Dahlias that are of all their kind the ones most useful in good gardening for grand effects of colour in the late summer and autumn. It is not to be denied that the starry flowers have a prettiness and refinement of form that will befit them for the show table and for room decoration, but to let these be the only garden Dahlias that we may now have seems to us a sheer perversion of good taste and good sense. Beautiful though some of the most free blooming of them are, there is scarcely one among them that for honest and simple garden use can approach in value such of the older flatted-petalled kinds as, among the reds, King of the Cactus, Cochineal, Lady Ardilaun, and Fire King; among yellows, William Pearce, Lady Penzance, and Lady Primrose; or such fine things as Henry Patrick among whites. To let this grand type of a good flower fall into disuse is to neglect some of the very best flowers we can have in our gardens.

We cannot but think that this exclusive approval of the starry, twisted-petalled flowers among the garden Dahlias is but a passing fashion, and would earnestly counsel growers not to lose sight of the fine old sorts such as those just named. Some of the most thoughtful and practical amateurs would not on any account be without them, and, though admitting and admiring many of the starry Dahlias, would never allow these to claim precedence of their more useful brethren.

Probably the taste for the newer varieties is to a large extent an artificial one. It may be that it is overfed by honours on the show table, and it would appear that it holds its present position more on account of the comparative novelty of form than as the result of a just appreciation of true beauty. The newer forms certainly cannot claim considera-

tion for garden utility in comparison with the best of the older Dahlias.

Another class of this good flower that, according to the evidence of the nurseries and the shows, is falling into disuse is that of the large-flowered, low-growing sorts. A few years ago there were grand things among these, already excellent and showing infinite promise, and of distinct utility in garden decoration.

We ask ourselves what is the meaning of these freaks in Dahlia fancy. In the case of the old show flowers we know exactly where we are. They are for the competitions of the Dahlia societies and for the pleasure of those who honestly enjoy their rigid perfections. They have their place, though that place may not be in the most beautiful gardens. But why a grand development of a good flower should be thrust aside in favour of a form of lesser utility it is difficult to understand. Are there so few people who care about the truer aspects of garden beauty, or is it that growers are so anxious to raise prize-winning varieties of the newer pattern that nothing else is put before the horticultural public at the shows?

We do not desire to decry the narrow-petalled Dahlias, but to remind amateurs of the extreme garden value of the good kinds that for a time at least are not receiving the consideration that is so justly their due.

KEW NOTES.

INTERESTING PLANTS IN FLOWER.

Temperate House.

CALCEOLARIA INTEGRIFOLIA, Clematis meyeniana, Crotalaria capensis, Desfontainia spinosa, Fuchsia simplicicaulis, Meryta Sinclairii, Pitcairnia ferruginea, Solanum pensile, Tacsonia Van Volxemi, and Tibouchina heteromalla.

Palm House.

Ardisia Oliveri, Chamsedorea pulchella, Ixora (various species and varieties), Quisqualis indica, and Thunbergia grandiflora var. alba.

T Range.

Echmea fulgens, Æ. f. var. discolor, Costus speciosus, Hamanthus coccineus, H. Katherinae, Hoya imperialis, Impatiens Oliveri, Ixora macrothyrsa, Kleinia Galpini, Medinilla Sieboldii, Physostelma Wallichii, Ruellia amena, R. rosea, Scutellaria coccinea, S. violacea, Stigmaphyllon ciliatum, Tillandsia splendens var. major, and Tylophora asthmatica.

Orchid Houses.

Bulbophyllum grandiflorum, B. mandibula, B. saltatorium, Cattleya Aclandiae, C. Eldorado var. Wallisii, C. Grossii, C. velutina, Cymbidium aloifolium, Cypripedium spicerianum, Dendrobium macrostachyum, D. sanguinolentum var., D. secun-

dum, Dipodium pictum, Epidendrum vitellinum majus, Habenaria carnea, Ionopsis paniculata, Lælia elegans, L. xanthina, Liparis elata, Masdevallia nidifica, M. veitchiana var. grandiflora, Miltonia candida, M. castanea, M. Clowesii, M. Cogniauxiae var. bicolor, Oberonia ensiformis, Odontoglossum aspidium, O. bicktonense, O. madrense, Oncidium crispum, Rhynchostylis retusa, Sarcanthus Williamsoni, Selenipedium calurum, S. caricinum, S. Sedeni, Spathoglottis plicata, S. pubescens, Stenoglottis longifolia, and S. l. var. alba.

Greenhouse.

Achimenes coccinea, A. longiflora macrantha and others, Bredia hirsuta, Calceolaria Burbidgei, Chironia linoidea, Geraniums in variety, Hydrangeas in variety, Lantanas in variety, Lilium sulphureum, and many other things. In this house are groups of well-fruited plants of Rivina humilis, garden forms of Capsicum annuum, and Solanum Melongena (Egg Plant).

Rock Garden.

Acaena microphylla, Aconitum paniculatum, Anemone japonica, Aster linariifolius, Calceolaria mexicana, Campanula venusta, Carlina acaulis, Chelone Lyoni, Dianthus superbus, Epilobium Dodonæ, Kirengeshoma palmata, Linum flavum, Lysimachia Henryi, Origanum pulchrum, Platycodon grandiflorum var. glaucum, and Polygonum affine.

Herbaceous Ground and Borders.

Alyssum maritimum, Anaphalis margaritacea, Aster (numerous species), Blumenbachia insignis, Coreopsis tinctoria, Cuphea Llaves, C. procumbens, C. Zimapani, Diascia Barbara, Digitalis laevigata, Echinacea purpurea, Gaillardias in variety, Galtonia candicans, Gladiolus in variety, Glaucum flavum var. fulvum, Hunnemannia fumarisfolia, Kniphofias in variety, Lavatera trimestris, Leptosyne maritima, Loasa hispida, L. vulcanica, Lobelia fulgens, L. sessilifolia, L. Tupa, Mirabilis Jalapa, Pentstemon (various species and varieties), Phytolius capensis, Rudbeckia maxima, Sclerocarpus uniserialis, Silphium terebinthinaceum, Stenanthium angustifolium, Tritonias in variety, Verbena Aubletia, V. erinoides, Veronica exaltata, and V. incana.

Arboretum.

Calluna vulgaris and varieties, Clematis in variety, Hydrangea paniculata, Hypericums in variety, and other things.

NATIONAL ROSE SOCIETY

THE DATE OF THE METROPOLITAN EXHIBITION.

THE following letter has been sent to us for publication:—

"To the honorary secretary of the National Rose Society. When, at the annual general meeting of the National Rose Society, held last December, it was decided by a majority of one to hold the metropolitan exhibition in the gardens of the Inner Temple on July 1 in preference to July 8, some of us doubted the wisdom of the decision. A leading evening paper, in its report of the show, dated July 1, states: 'The National Rose show this year is an exhibition representative only of the Southern Counties. The Midland and Northern Counties will not be able to show for a fortnight or so. That the southerner has had it all his own way will be seen by the record of the trophies and principal prizes.' We may add to this that in no instance was the

southerner at his best. But even if he was the compulsory absence of the northern and Midland growers, not only in this but in several years past, seriously challenges our society to the name of National.

"At the metropolitan exhibition is held the friendly contest for the championship of the year. This gives it an importance not possessed by any other Rose show. When this is held Roses should be at their best. Can it be maintained that Roses are at their best between July 1 and July 4? Yet it is on these dates that the metropolitan show has been held six times during the last seven years.

"It will be seen from the subjoined extracts from the annual reports that in two years only out of seven was the metropolitan show a good one. The one in 1887, held on July 2, an abnormally early season, the other in 1900, on July 7, the largest . . . yet held by the society. On the other hand, the same reports affirm that the northern show held, with one exception, on dates ranging from July 15 to July 19, was invariably a good one, four shows out of seven being described as 'the best Rose show of the year.' We are therefore of opinion that the metropolitan exhibition is held on too early a date.

"If it be pleaded that this exhibition should be held alternately, early and late, we would reply, that the latest date on which this show has hitherto been held is not late, but barely mid-season. And, mindful as we are of the large number of exhibitors residing south of London, we nevertheless think that the interests of individual exhibitors should be subservient to the interests of the National Rose Society as a whole; we desire that the public may see the Roses at their best, and that the metropolitan show may be recognised as the best Rose show of the year.

"Distance from London militates against a representative gathering of rosarians at the annual general meeting. We therefore deprecate that the fixing of the date of this important exhibition should be left altogether to a chance majority of those attending and voting, and we ask that 'Regulations to Exhibitors,' should be added these words, 'The Metropolitan Show shall not be held earlier in the year than July 6.'

"S. Reynolds Hole, president, The Deanery, Rochester; F. R. Burnside, vice-president, Great Stamburgh Rectory; Rochford, Essex; George Gordon, vice-president, Kew; E. B. Lindell, vice-president, Bearton, Hitchin; Henry V. Machin, vice-president, Gateford Hill, Worksop; Joseph H. Pemberton, vice-president, The Round House, Havering-atte-Bower; Alfred Tate, Downside, Leatherhead; W. Wilks, vice-president, Shirley Vicarage, Croydon."

Several extracts from the annual reports of the National Rose Society for the past seven years then follow. They all show that a later date would be advisable.

NOTES OF THE WEEK.

FORTHCOMING EVENTS.

September 9.—Great Autumn Show of Royal Caledonian Horticultural Society (two days). This show is held in Edinburgh; Dahlia Show at York.

September 11.—Manchester Dahlia Show.

September 15.—National Dahlia Society (Committee Meeting); Royal Horticultural Society (Meeting of Committees), twelve noon.

September 16.—Hull (two days).

September 29.—Royal Horticultural Society and Conference at Chiswick (three days); Gardeners' Dinner, Holborn Restaurant, six o'clock.

National Rose Society.—Alteration of the date of the summer show.—On page 161 will be found a letter from the president of the National Rose Society and a few others keenly interested in its welfare, urging the importance of fixing a later day for the metropolitan show. There is wisdom in this, but we do ask to be delivered from a two-day display unless special provision is made the second day to provide the public with flowers that they have paid their money to see and expect to do so.

The London Dahlia Union.—Owing to the closing of the Royal Aquarium, Westminster, the annual grand display of Dahlias made by the union, which comprises all the leading Dahlia raisers and cultivators of the day, will take place in the Prince's Hall of the Earl's Court Exhibition, which is near the entrance in the Warwick Road, on Wednesday and Thursday, September 16 and 17. It is during this particular week that the

popular Cactus Dahlia is seen at its best, and on this occasion there will be on view not only all the finest new varieties of the present year, but several from abroad, including some very singular and interesting variations of the type of home and foreign production. As the Dahlia show will form a part of the general exhibition, it is free to all who pass the gates, and the flower-loving public will have an opportunity of witnessing one of the largest exhibitions of all types of the Dahlia ever seen in London. The secretary and manager is Mr. Richard Dean, V.M.H., Ealing, London, W.

A record price for Kent-grown Potatoes.—Messrs. Horne and Sons, Cliffe, Rochester, have sold to a speculating buyer two tons of Northern Star for £317. The said buyer has refused £400 already for them. This Potato is turning out all that is claimed for it—strong grower, abundant cropper, good quality, and free from disease. It is expected that Northern Star will make £400 per ton before Christmas. There are plenty of buyers but few sellers.

Gladioli from Messrs. Kelway and Son, Langport.—It is always a pleasure to receive a boxful of flowers from Messrs. Kelway, especially of those things which they have made in a sense their own, such as the Gladiolus. Visitors to the large shows held all over the country and to the Drill Hall, Westminster, are aware of their beauty. We are reminded of them now by several varieties, which show how much we owe to Messrs. Kelway for the advances made in acquiring new sorts. One of the most beautiful was Egeria, the flowers set thickly on the stem, and of the softest heliotrope, a peculiarly lovely shade. Seraph was quite different; the flower is large, but without any tendency to coarseness. Its colouring is brilliant rose, with deeper stripes. Gribou is one of the softer colours, white, with rose-purple stripes on each segment, a very distinct and welcome flower. Duke of Norfolk is an immense scarlet variety, and must make a gorgeous show in the nursery. These are only a few of the varieties sent, but none were of poor colouring or form.

A rare sweet-scented annual.—A rare annual flower has come to light, which, if we mistake not, will be sought after in the future. It bears the terrible name of *Hebenstreitia comosa*, and it comes from South Africa. We noticed a lot of it in the seed-beds of Messrs. James and Son at Farnham Royal, and at first thought it was a form of *Mignonette*. The flowers are on a slender spike, and have just that dull shade of white that even the best *Mignonettes* possess. It is pretty in the daytime, but on a warm summer evening a nutty scent floats over the garden; it comes from the *Hebenstreitia*, and many will agree with the writer that a mingling of perfumes distilled from *Mignonette*, Rose, and Virginian Stock, and such a fragrant flower as the *Hebenstreitia* gives a new joy to the garden when the flowers are in darkness. A whiff of *Hebenstreitia* perfume is delicious. The seed may be sown outdoors in April. It was introduced—at least, brought into conspicuous notice—by Messrs. Sutton and Sons of Reading.—VIATOR.

The Blackberry season.—With the advent of September, and the slow ripening of Blackberries in the hedges, thoughts turn to this delicious wild fruit, particularly in the case of those who seek to add a little to their incomes by picking the berries for sale. Whatever may be the failures with fruit under cultivation, Nature seems to have a way of protecting her wildings, and the seasons are not many when Blackberries are a failure. This year they promise to be a good crop, and on account of the scarcity of other fruits there is sure to be a good demand. Apart from any other considerations, however, there is a peculiarly delicious flavour about Blackberries which no other fruit possesses, and they make an excellent jelly. All points considered, then, it seems likely that Blackberry pickers will enjoy a lucrative season.—H.

The late Mr. William Housley, Sheffield.—We are now able to supplement the brief notice given that we gave in last

week's issue of the death of Mr. William Housley in his fiftieth year. For the last thirty-two years he had been on the staff of the Sheffield General Post Office, and from 1894 to the time of his decease he held the position of assistant superintendent. It was as secretary of the Sheffield Chrysanthemum Society, however, that he was so well known to northern horticulturists. He held this position for fourteen years, and the success which attended the many shows held at the Corn Exchange, and in more recent years in the historic Cutler's Hall, was largely due to his zeal. The interment took place at Norton Cemetery, Sheffield, on Friday, the 28th ult., in the presence of a considerable gathering of people, in which was included a wide circle of gardening friends. Representatives from the Sheffield General Post Office and the Sheffield Chrysanthemum Society, besides those of other societies in affiliation, were there to pay their last respects to one who had served them so well.

The Gardeners' Dinner.—At a meeting of the committee promoting this gathering, held on Tuesday last, it was mentioned that foremen and under-gardeners believed they were not eligible to be present. The committee desire it to be known that all associated with horticulture will be cordially welcomed. It was also resolved that no tickets could be issued later than the 25th inst., and that by that date all must be paid up. It is also desired to be known that where parties of friends wish to sit together, if any one ticket-holder will send his name and the number of his party to Mr. A. Dean, the secretary, Kingston-on-Thames, the dinner committee will endeavour to arrange accordingly. Up to this date 320 tickets have been issued.

The Hollyhock as a wall plant.—I was at a place called Ashton Keynes last week; it is on the infant Thames, in Wiltshire, above Cricklade. The cottage gardens there are very pretty, well kept, and full of flowers. Each garden has a dipwell in it, with a circular raised wall round it, about 2 feet 6 inches high; the water is quite near the surface and the pails are lifted out by means of a stout stick with a hook at its end. Most of the cottages have the infant Thames between them and the road, and each cottage and house has a bridge to it. But all this is not what I am troubling you with a letter about. What I thought would be a novelty to you as it was to me was a pink Hollyhock grown as a creeper against a wall. The cottage in this case came right up to the road, from which it was separated by a very narrow strip of fenced in garden, scarcely 2 feet wide, and in this the Hollyhock was planted. Its leading and side shoots were trained back to the wall between the door and the window, a space of about 18 inches wide. On this narrow strip of wall the plant did wonderfully well. It was held back by string nailed across, and the foliage and blooms accommodated themselves to the situation. I hardly knew what it was at first; without my glasses I thought it was a new sort of Rose. It seemed a bit cruel, but considering the limited space it was very excusable, and the effect was good.—G. D. L.

Hippeastrums at Shrewsbury.—We have been accustomed to regard Captain Holford's exhibit of Hippeastrums at the Temple Show as startling by reason of the lateness of their blooming, but what shall be say of the display at Shrewsbury nearly three months later, when they were shown as fresh and bright as in the spring? It is difficult to understand how they have been retarded to such an extent, for the refrigerator system, so much in vogue with Lilies and other hardy plants, would be fatal in the case of such tender plants as the Hippeastrums. Be the means employed what they may, the results are certainly highly satisfactory, that is as far as obtaining good flowering examples of a beautiful class of plants quite outside their usual season of blooming.—H. P.

The outdoor Tomato crop.—The succession of tropical summers of a few years ago gave a wonderful impetus to the culture of outdoor Tomatoes, and not only did they come to be represented in nearly every garden, but acres of plants

were grown outdoors for market, and showed respectable profits at the close of the season. Encouraged by success the culture of Tomatoes outdoors extended, but the season of 1902 proved beyond doubt that the profitability of this crop in the open is very largely a question of weather, and this year we have further demonstration of the fact. I know men who went to the trouble and expense of raising hundreds of plants last year, and devoted acres of good land to them, and then got barely enough back to pay for the seed. The damp and backward season prevented the setting of the blooms, and in cases where this was effected the black spot disease which set in later upset any calculations that were formed regarding ripe fruit. This experience naturally checked the ardour of many who thought they had struck a good line with outdoor Tomatoes, and they gave it up, but others held on and planted again this season. I wish them all success, but by the end of 1903 I think it will be generally agreed that Tomatoes in the open are a very precarious crop in Britain. Tomato growing for pleasure and profit are two different things, and even if the amateur does get a few successive failures they do not affect his pocket, and he will doubtless go on planting with the hope of better results. At the same time, I wonder how many hundreds, even thousands, of plants have been raised and planted this year that will return absolutely nothing to the cultivators, even in private gardens. In my own experience I have seen instances enough to satisfy me that my calculation is not outside the mark, and even in very favourable circumstances the amount of sunshine we get in September will govern the quantity of ripe Tomatoes obtained outdoors. Taking into consideration the uncertainty of our climate, whether the game is worth the candle, is a matter of individual opinion, but I am convinced that the only man who can hope to do anything with Tomatoes outdoors, except in very favourable seasons, is he who follows a certain defined routine of treatment. This really consists in putting out strong plants early in June and growing them in a warm and favourable position. To put out tiny, undernourished weakly plants and expect them to establish themselves and produce a crop in such a season as this is sheer folly. The time at their disposal is not long enough. In a few cases I have seen Tomatoes ripened outdoors in August this year, but they were well established when put out, and enjoyed the favourable conditions of a warm south wall. Restricted root room is also advisable in the case of outdoor Tomatoes and plants that are grown in boxes, wooden pails, or pots plunged in the ground make less sappy growth, and commence to show fruit earlier than specimens that are planted in the open ground.—G. H. H.

The Gladstone Pea.—This fine late Pea was the variety at Shrewsbury show, where vegetables were shown in such superb form. How quick high class growers such as Messrs. Gibson, Beckett, Horspool, and others are to secure the finest exhibits, for the Gladstone Pea was found in most of the leading collections of vegetables, as well as taking the highest places in the single or double dish classes. No one seems to know who raised it or first put it into commerce. It would be interesting to know. The pods are long, slightly curved, invariably containing ten good Peas, opens and shells well, a great recommendation, pods and Peas good colour, and the latter of excellent flavour. It holds the same place as Senator does among the early ones. Both are about 3 feet in height, and are heavy croppers. When grown at Chiswick at the same time, so fine were they that the fruit committee unanimously awarded both varieties a first-class certificate.—A. D.

Agapanthus minor mooreanus.—The Blue African Lily, as the Agapanthus is popularly called, is so ornamental that it is regrettable it is not hardy in every garden. There are some gardens, of course, where it is hardy, even in North Britain, and one may mention such nurseries as that of the Messrs. Cocker, of Aberdeen, who grow it largely. If, however, these larger forms of Agapanthus minor are not hardy, this is not the case with the pretty little A. minor mooreanus, often sold simply as A. mooreanus. Growing in a

dry and sunny position here it has increased greatly since first tried outside some years ago, and even in a disappointing season like this for sun-loving flowers it has done exceedingly well. It is never protected, and never fails to send up its fresh leaves and its long, wind-resisting stems, bearing each their umbel of blue flowers. The present seems a good time to draw attention to its beauty and hardiness.—S. ARNOTT, *Carsethorn, by Dumfries, N.B.*

Eccremocarpus scaber.—Although it is about eighty years ago that this beautiful creeper was introduced into England from Chili, it is seldom met with in suburban gardens, probably because its habit of dying right down in the winter makes it useless for hiding unsightly walls. In Kent there is a picturesque house set in a wide expanse of trees and Bracken. With its latticed windows, rough straw-coloured walls, and long roof being rapidly weather painted lovely shades of red and purple, it has little need of creepers; but on the south side a plant of Eccremocarpus scaber was put in last autumn. The sandy soil seemed to suit it. It began to climb in the spring, and has reached the second story. It flowered first in July, and should continue to do so until November. From within the house the graceful flower sprays look like some delicate tracery across the window pane, but they bear unruined much buffeting from wind and rain, a good trait in such seasons as this. The tubular flowers match in colour the Montbretias in the border below. This orange, washed with red hue, and the cool green leaves on a pale yellow background, make one of those happy combinations of colour that satisfy the eye at the time, and remain in the memory for practical use afterwards. The seed-pods are pretty, looking like bunches of fruit. To propagate the plant seed should be sown in heat in February, and will flower out of doors the same year, or cuttings can be taken in August and kept in a cool frame during winter. In sheltered places the roots may be left in the ground all winter; when likely to be exposed to frost and wet, it is best to protect them, or take them up, replanting them again in May.—W. SPURLING.

Begonia Marie Bouchet.—There is a widespread idea that only new or comparatively new plants are given certificates or awards of merit by the Royal Horticultural Society, but that such is not the case is exemplified by this Begonia, which was distributed as long ago as 1880; indeed, it may be regarded as one of the earliest Begonias with double blossoms, and the representative of a type which has been ousted by the desire for compact habited plants with large erect flowers. The specimen in question was given an award of merit, a well-deserved honour, for, as shown, the long trailing shoots formed an admirable subject for growing in a suspended basket, a purpose for which those of compact habit are not so well adapted. This Begonia is only one of many subjects that have been introduced, then nearly lost, and finally reappear in after years, attracting then far more notice than they did at first.—H. P.

THE EDITOR'S TABLE.

WE invite our readers to send us anything of special beauty and interest for our table, as by this means many rare and interesting plants become more widely known. We hope, too, that a short cultural note will accompany the flower so as to make a notice of it more instructive to those who may wish to grow it. We welcome anything from the garden, whether fruit, tree, shrub, Orchid, or hardy flower, and they should be addressed to The Editor, 20, Tavistock Street, Covent Garden, London.

DODDER ON HEATHER AND GORSE.

Miss Smallpiece sends a very interesting contribution to our table, some shoots of Heather and Gorse with Dodder growing on them. They were picked on the Canford Cliffs near Bournemouth, and masses of Heath and Gorse were quite covered

with it. Our correspondent asks: "Is it unusual for it to grow on Heather as well as Gorse?"

We have frequently seen it on the Gorse, but not on Heather. Perhaps someone will kindly answer the question.

ECHINOPS MACROCEPHALUS.

Mr. Hiatt Baker sends flowers of this handsome plant with the following note: "This is very distinct from any other Echinops I have yet seen in its general character. It forms a bush some 3 feet high, and when well grown produces flowering heads from the axils of nearly all the leaves up the main stem. The leaves alone make it worth a place as a foliage plant. The bottom ones are 18 inches or more long, deeply cut, of firm substance, and armed with strong whitish spines at all their points. The inflorescence, as you will see by the specimen sent, is most interesting before the flower-head emerges from the protecting leaves, in which state the leaves are bound together by a fine web, as if a caterpillar had spun a cocoon amongst them. The flowers are whitish, and therefore not so attractive as those of some of the family. The plant is—I understand from Canon Ellacombe (who sent Kew their plant)—of Siberian origin."

CANTUA DEPENDENS FROM THE ISLE OF WIGHT.

Lord Walsingham sends from Mrs. Gwytherne-Williams' garden at Belvedere, St. Lawrence, Isle of Wight, flowers of Cantua dependens, which "has been out unprotected five years at the foot of the stone steps going down from the house, and has now flowered for the first time. Mandevilla suaveolens has also flowered there this summer."

We are much interested in seeing flowers of this brilliant Cantua, which we usually associate with the warm greenhouse, from the open garden. Such contributions to our table only show how many things we grow under glass will in the warmer parts of the island flower in the open. The flowers sent were exceptionally fine.

BUDDLEIA VARIABILIS.

I am sending some flowering sprays of Buddleia variabilis, showing two distinct shades of colour, one considerably richer and darker than the other. Three years ago I received two small plants from the Royal Horticultural Society, which have flourished and grown amazingly, being now from 6 feet to 8 feet high and as much in diameter, and both have been covered with bloom for many weeks past. I also got a small specimen of B. intermedia from the Royal Horticultural Society, but this is apparently not such a strong grower, though the blooms are of a very pleasing shade, darker than the best of the two intermedia. All seem to be hardy and very desirable, though they evidently require plenty of space in which to attain their full development.—S. G. R.

Beautiful sprays of Buddleia variabilis, one much darker in flower colouring than the other.

SHRUB FLOWERS FROM TORQUAY.

Mr. H. D. Palmer, St. Mary Church Road, sends some more interesting flowers with the following note: "I send you a few more flowers from tender shrubs that are doing well in my young garden (two years). They have all stood two years, unprotected in the winter, and are doing well. The Mitraria coccinea is a most beautiful semi-scandent habited shrub, and its cheerful small foliage looks well at all times. It is so neat, but when covered with its dazzling scarlet flowers it is unique. Next to it I have Philesia buxifolia and Tricuspidaria hexapetala in a peat border facing north-east, but sheltered from all winds but south-east, and partly from that at the back are Lapagerias, white and rose. The Philesia flowered a little time ago, but seems at present more bent on pushing out underground shoots than to increasing its head, so I do not expect many flowers till its root activity has closed a bit and a bigger head formed. All are doing well. The Metrosideros floribunda grows in the open and is doing well. I have another sort, with cream flowers, I got under the name of Callistemon angustifolia, but I

have not had it long enough to say how it is going to do. The evergreen *Pentstemon cordifolius* is making fine growth against a south-east wall, and is covered with flower. *Lagerstroemia indica* lives with me unprotected, but has not yet flowered. I send you two *Ceanothuses*, *Indigo* and *Lustre*, new sorts, which are welcome as a break in the range of cold blues of so many of them. I send a spray of *Gloire de Versailles*, which is growing rampantly against the house as a contrast. *Indigo* is a very fine shrub, and when well established will be remarkable in its deep blue clothing."

An interesting collection of tender shrubs in full flower. We were pleased to see the beautiful *Ceanothus Indigo*. It is the finest of its race for colour, a deep blue.

JABOROSA INTEGRIFOLIA AND SCABIOSA PARNASSI.

Mr. Fitzherbert sends from Kingswear, South Devon, the following note: "I send you flowers of *Jaborosa integrifolia*, the white *Nicotiana*-like bloom, and *Scabiosa Parnassi*. The *Jaborosa* is growing in light dry soil in a sunny spot, and flowers from early in July till September or later. The flowers have a Musk-like fragrance when fresh. The *Scabiosa* is a good rock garden plant, and spreads fast. The grey-green foliage is very dwarf, and is a setting to the rosy lavender flowers. It appears perfectly hardy here."

Two interesting plants; the *Jaborosa* is, as described by our correspondent, quite a "*Nicotiana*-like" flower. We were pleased to see the pretty little *Scabiosa Parnassi*.

PANSY QUEEN OF THE YEAR.

Mr. Crane sends a bunch of flowers of this pretty little "miniature" Pansy, which was raised by the late Dr. Charles Stuart. It is a delightful plant for the rock garden, and has blue, sweetly-scented flowers, which are about the size of those of the *Violet California*.

HEATHS FROM THE SURREY HILLS.

Mr. J. Clark sends a boxful of flowers for our table of the Heaths described below with the following note:—

"From the end of June until frost sets in there are Heaths of some sort or other in flower on the commons and railway banks throughout a great part of Surrey. The first to come into bloom is

"*Erica cinerea*, which is found throughout a great part of Western Europe, and probably no wild plant makes such a blaze of colour or lasts for so long a time. It first opens during June, and I have found plants of it in full flower at the end of September. The colour is a brilliant reddish purple, and the effect of half an acre or more in full flower is magnificent. I have heard that this is sometimes a difficult Heath to grow in a garden, but, if it is any guide, I may say that in a wild state it is found growing and flourishing in almost pure white gravel, the only soil being about 2 inches of sandy peat mixed with the gravel, while from 1 foot to 3 feet down one finds what is locally known as 'rust,' and which is as hard and as poor as a piece of rusty iron, which, in fact, it very much resembles. There are several varieties of this Heath which have received distinctive names, but such forms as *atroanguinea*, *purpurea*, and *rosea* can all be found in a day's ramble. The white variety *alba* is not so easily found; I have only seen one specimen of it in a wild state during the last two summers.

"*E. Tetralix* (the cross-leaved Heath) comes into bloom soon after *E. cinerea*, and is not so common as the others, being more scattered, so that a large mass of it is rarely seen. The leaves are in whorls of four, occasionally five, and are covered with white, silky hairs. The flowers are borne in terminal clusters, and delicate pink. There are two forms of this, *vars. alba* and *rubra*, and all make good garden plants. *E. Tetralix* is sometimes confounded with *E. ciliaris*, but the latter is only found in the south-west of England, though in general appearance the two plants are very much alike. The commonest Heath of all, however, is the Common Ling or Scotch Heather.

"*Calluna* or *Erica vulgaris*.—This covers acres of hillside with purple during the latter part of August and throughout September. It grows so thickly and the stems cross and recross each other so much that it is tiring to walk far through it. The soldiers of the 1st Army Corps found this out during the manoeuvres this summer, when they had plenty of marching through it, and raining most of the time, too. Many forms of this can be found, but rarely one equal to those now in cultivation, though the white one is fairly abundant. The best of the varieties are *alba minor*, *alba Serlei*, and *Hammondi*, white; *Alporti* and *flore-pleno*, purple, the latter double-flowered; and *rosea* and *rubra*, described by their names."

THE FLOWER GARDEN.

WATER LILIES IN 1903.

AFTER such an unfavourable season for bedding and flowering plants in general it is pleasing to find one bright and enjoyable spot in the pleasure grounds, viz., the water garden, although the *Nymphaeas* flower most freely when the weather is warm and we get plenty of bright sun. In spite, however, of the bad, sunless summer, we have had quantities of lovely flowers floating on the surface of our pools. The new varieties that have been introduced to our pools year by year have made the water garden one of the most pleasant places in the whole garden. The many visitors we get here to see the *Nymphaeas*, their admiration of them, and the number of enquiries for the best sorts and how to grow them, show that they will eventually be a feature in many more gardens than they are at present. After some years of practical experience in the cultivation of water plants, it may be of service to some about to start a water garden for me to send you a few notes on their cultivation here.

In the eight pools we have over fifty perfectly hardy *Nymphaeas* thriving well, and each variety has its especial charm, so much so that I should not like to lose one of them. My first flower opened on May 26. It was of *N. Laydeckeri purpurea*, and unless severe weather sets in some of the varieties will flower well into October. I strongly advise those about to

MAKE A WATER GARDEN

to choose a sunny position and sheltered from very rough winds. Above all avoid formality. The water garden here was made out of what was considered a useless boggy piece of coppice ground. There was a small pond close by and a very small spring feeding it, but it happened to be at the highest end of the coppice. This pond gave us our first start in water gardening. We have now laid out about four acres of this coppice ground, and formed eight pools for *Nymphaeas*, and a wind-about ditch for moisture-loving plants. This sort of rough old pond is found near many gardens. Why not make it beautiful with water plants? The eight ponds are all fed by the first and old pond, the water being carried from one to the other by pipes under the turf; the pools are cut out so as to give them as natural an appearance as possible, and run about in various directions, with clumps of moisture-loving plants between and near them. Sufficient short mown grass goes all round some and partly round others, so that visitors can examine with ease each *Nymphaea* when in flower. Small pools of this sort have advantages over a large lake for growing water plants; they can be made to have a more natural appearance, and the flowers can be seen and better examined, whilst it admits of more variation in the surroundings. In some places we have various *Reeds*, *Bamboos*, *Bulrushes*, *Lythrums*, and *Iris laevigata* (Kämpferi); in others patches of *Lobelia cardinalis*, *Cannas*, standard and bush *Fuchsias*, *Lilies*, *Hydrangeas*, *Erythrinas*, *Agapanthus*, &c.

Returning to the *Nymphaeas*, in each pool we grow from ten to fifteen sorts, all carefully labelled. We use zinc club labels. The plants are from 4 feet to 8 feet apart, according to the habit of growth of the various sorts. None are grown in water over 2½ feet deep; I find that they always bloom most freely in shallow water, especially the new hybrids.

Many plant their *Nymphaeas* in baskets made for the purpose, but I prefer large Orchid pans in first starting a new plant, especially if it is weakly. Pot the plants in rather stiff fibrous loam, squeezed in firm, and sink it in shallow water to begin with. As the plant gains strength shift it to deeper water, and when

VIEW IN THE GARDENS AT SANDHURST LODGE.

it is well on the way to make a good plant put it in its permanent place, sinking the pan in the mud at the bottom of the pond till it reaches the upper rim. This way of planting in small ponds has its advantage over the basket. In small ponds in a few years the plants require rearranging, and many of the strong-growing ones reduced. For this purpose I use a strong manure drag; work the prongs under the pan and attach a cord to the handle so that some can pull by the cord, others by the handle. This will generally fetch the whole plant out in a lump. It can then be divided as one wishes, and replanted again in the same way as before. Some recommend a good large clump of one variety, and on a large sheet of water this, no doubt, would be best, but in small pools it is different. Here variety of colour makes the most charming effect, and several medium-sized plants, with one to three crowns, are very pretty. If there are several pools, try and avoid a repetition of the same varieties in the different pools.

THE BEST NYMPHÆAS.

The British Water Lily (*Nymphaea alba*), grown in 1½ feet of water to a single crown blooms very freely and throws fine, pure white flowers. *N. Marliacea albida* has a gigantic snow white flower, and if the old and the small leaves which are often thrown up in the centre of the plant are picked off and the plant kept to one or two crowns the flower is very fine. *N. gladstoniana*, a very robust grower treated in the same way, throws up very large white flowers, quite distinct from the preceding one.

N. candida is another very large white; treat it in the same way. *N. tuberosa Richardsoni*, pure white, very large, with rounded petals, a very distinct variety. These four require about 2 feet of water, and this depth should not be exceeded or the display of flowers will not be large. *N. Marliacea carnea*, *N. M. rosea*, *N. Colossea*, and *N. William Doogue* have very large flowers, all delicate pink or blush, each distinct, and bloom continuously. They require similar treatment to the white, and the same depth of water. *N. Chrometella* is a fine lemon yellow sort, likewise requiring the same treatment. *N. odorata sulphurea* and *N. o. a. grandiflora* are very large flowered, the former deep sulphur, the latter much lighter. These make crowns very freely, and require replanting every other year. A depth of 18 inches of water is quite deep enough. *N. gloriosa* is a rich glowing red, very large, and of strong growth; it requires 18 inches of water, but need not be shifted for several years; it does not make crowns or foliage so freely as the former ones, and only the bad foliage need be picked off from time to time. *N. ignea* and *ellisiana* are much the same colour as *gloriosa*, but not so large in foliage or flower; they are very lovely, and *ellisiana* is exceptionally free. About 15 inches of water will grow these two well.

Among the best deeper shades with reddish crimson flowers are *Laydekeri fulgens*, *L. purpurea*, *William Falconeri*, *atropurpurea*, *Frebelli*, and *sanguinea*. These are six really fine, free-flowering *Nymphaeas*, requiring about 15 inches to 18 inches of water. The plants will not require dividing for three or four years. Keep the old foliage picked off during the flowering season.

Among the best brick-red flowered sorts are *N. andreaana*, *N. robinsoniana*, *fulva*, and *Aurora*. A depth of from 15 inches to 18 inches of water suits these four sorts; they are very free flowering. *N. suavisima*, *N. odorata rubra*, and *N. o. Exquisite* have lovely pink flowers. The foliage of these is short, and shallow water suits them best. They are best adapted for planting round the edge of the pond. *N. Laydekeri lilacea* is a lovely rosy lilac-flowered sort, and *N. Laydekeri rosea* and *N. L. r. prolifera* are also of a rose colour, varieties requiring rather shallow water. *N.*

NYMPHÆA MARLIACEA ALBIDA IN THE GARDENS AT SANDHURST LODGE.

pygmæa Helvola is a very small variety both in flower and foliage, but the flowers are thrown up in the greatest profusion the whole summer, and are of a delicate canary yellow, which makes this *Nymphaea* a real gem for shallow water. There are several other really good intermediate shades, but the ones I have described are the best, and would make a good effect to begin with.

W. TOWNSEND.

The Gardens, Sandhurst Lodge, Berks.

PROPAGATION OF THE DUTCH HYACINTH.

THE Hyacinth of the florists flourishes, reproduces itself, and preserves all its splendour from year to year nowhere better than in the neighbourhood of Haarlem in Holland. Its cultivation has been almost centralised there, though every country in the world has received bulbs from the Haarlem growers. Hence it happens that its intensive cultivation is scarcely practised elsewhere, and it is generally supposed that propagation is effected by simply separating the offshoots in the same manner as for most other bulbous plants. This normal method, it may be said, will suffice for an amateur, or for the more prolific varieties of Hyacinths; but when it is a question of obtaining thousands of bulbs, and still more, when it is a question of rapidly propagating new varieties, then in order to succeed an artificial method must be followed. It is this method, or rather these methods (for there are several of them), that we will describe. One of them at least is so abnormal, so foreign, to the law of natural evolution that it is interesting both as a matter of practical horticulture and of vegetable physiology. This process is not, however, special to the Hyacinth, since it is produced spontaneously on another plant of which we shall speak.

We know that in the Hyacinth, as in all other bulbous plants, properly so called, the bulb constitutes the essential vital part. This bulb is composed of a fleshy disc, which occupies the lower part, and represents a stem enlarged by flattening, the upper part constitutes the stem itself, whose leaves are represented by fleshy scales inserted in concentric circles. Normally, these bracteal leaves each shelter, as in other plants, a latent bud. Proof of this is furnished by the off-

shoots or young bulbs, which spring from buds sheltered by the old scales. In order to favour the development of these latent buds it would seem reasonable to free them from the scales which imprison them, and this is just the object of the two following proceedings: First, the mother bulb is cut vertically from its base to half its height into four, six, or eight parts, and then planted as soon as the wounds are healed; second, the mother bulb is cut horizontally, nearly in the middle, the lower part is then dried and planted. In both cases the number of offshoots produced by these mutilated bulbs is numerous, and may amount to as many as fifty.

The third proceeding, to which we especially call attention, is different, and is as interesting in principle as happy in effect. So far we have seen that the flattened stem is, as it were, the heart of the bulb, since it bears at the same time the roots, the scales, the latent buds, the normal leaves, and the central inflorescence. When the bulbs are taken up the scales are separated by means of a pointed and very sharp knife, just above the point of insertion, without deforming the bulb. The bulbs thus treated are like the others, kept dry during the summer, and at the time of planting at the base of the scales young offshoots are seen to be developing. We should have some doubt as to the efficacy of this proceeding if we had not seen in Holland bulbs thus treated develop a considerable number of scales, each provided with a leaf; and if we had not repeated the experiment.

The scales of bulbs being simply modified leaves adapted for use as reservoirs of nutritive matter, the proceeding becomes one of taking leaf-cuttings. We know that certain plants belonging to different families are susceptible of being propagated by cuttings from the leaves. The families of the Begoniaceae, Gesneriaceae, Cactee, and Crassulaceae include genera and species which practically are propagated by this method, notably the *Gloxinia*, *Begonia Rex*, *Echeveria*, &c. *Sedum corsicum*, which is admitted to be a hirsute form of *S. dasyphyllum*, offers one of the most curious examples of this, inasmuch as about the middle of the summer it drops its lower leaves, which spread upon the soil, first develop a bud, and then take root before the autumn, thus forming hundreds of independent plants.

Had it not been for the demands of commerce

who would ever have thought of thus depriving Hyacinth bulbs of their most essential part? Is it not a case of the old proverb, "Necessity is the mother of invention?" For science and industry we know are indebted to it for a host of discoveries of which they may well be proud.

S. MORTIER, in *Revue Horticole*.

THE TULIPAS.

(Continued from page 151.)

III.—DARWIN TULIPS.

THE Darwin Tulips are modern improvements on the old race of "Breeder" or "Mother" Tulips, so called on account of their great vigour and prolific increase. They are generally very tall, ranging from 18 inches to 3 feet high, and their flowers, though not proportionately large, have very stout weather-resisting petals, and the colours are generally clear and well defined, whilst many are exceptionally brilliant. They are May-flowering, and their cultivation calls for no special remark—one can grow Darwin Tulips anywhere, and grow them well. They are characterised by cup-shaped flowers, stout glaucous stems, free of leaves for quite one-half their length, and by very large bulbs which increase rapidly by offsets. Their colouring is usually self, varying in shade in different parts of the flower, and often with brilliant "eyes" or basal colouring. The "broken" Darwin, i.e., those which have sported a variegation, are separately classed as "Rembrandt" Tulips, and very beautiful they are. Little attention has hitherto been given to them, but there are many beautiful "breaks" well worth perpetuating, and in the near future they will doubtless find a place in most gardens. The Darwin Tulips are so loosely named that one cannot trust the lists of dealers, and "new" varieties are constantly being evolved by simply juggling with names, thus adding to the muddle. A selection of twenty varieties has been made, embracing all shades of good colours, and one can recommend them as the best of a representative collection, having regard to such points as colour, form, and capability of withstanding bad weather.

Beethoven.—Stems 20 inches high; flowers with broad petals, coloured rose, shaded silvery near the tops; basal colouring bluish grey externally, Cambridge blue internally, a shaft of white running throughout the length of each petal.

Clara Butt.—Stems 20 inches high; flowers globular, coloured a soft shade of salmon rosy near the base, and flushed externally with delicate pink; basal colouring a slight tint of blue. A very choice and deservedly popular Tulip, and the only good "Darwin" of this colouring.

Coquette (Van Dyck).—A very pretty flower of medium size; petals rosy, flushed darker near the mid rib, and keeled white on the inside; basal colouring Cambridge blue edged with a dark zone of red; stems, very slender, 18 inches high.

Diana.—Stems 18 inches high; flowers small, crimson, surfaces very glossy; base a small disc of rich blue. A neat and bright-coloured Darwin resembling Bouton d'Or in shape.

Early Dawn (Stabens).—Stems 2 feet high, very strong and thick; flowers rose-coloured externally, vermilion internally; basal colouring white, with slight blue stain. A noble-looking Tulip of fresh colouring, excellent in the garden.

Flambeau.—Tall, bold Tulip, coloured intense glowing crimson, outer base white, inner base blue-black edged with a broad band of sulphur; the basal colouring of this flower

is very remarkable, resembling a three-rayed Maltese cross resting on a black disc. A perfect Tulip in all ways, more dazzling than a Gesner, and possessing the refinement and basal markings of the rare Tulipa Eichleri of Regel.

Glow.—A very brilliant Tulip of medium size, coloured like T. gesneriana major; basal colouring white externally, blue-black internally, with a white dividing band. Its colouring is very clear and distinct.

Harry Veitch.—A glorious Tulip; stems pale green; petals very thick and broad; coloured a brilliant dark crimson, white near the base externally, furnished with a coal-black disc internally, and edged with a broad band of white from which several horns or rays of white project to the middle of the segments. A bold Tulip 2 feet high, very brilliant and refined.

Hecla.—Stems 2 feet high; flowers coloured black maroon; perfectly self throughout, but not quite so dark as La Tulip Noire, but larger and bolder; may be described as the best of the sombre-coloured Tulips for general purposes.

Hippolyte.—Stems 2 feet high; flowers rich lilac, shading to a white base externally; inner base bluish grey, shading to a magenta tint near the middle of each petal; the reflexing margins are pale lilac; a giant Tulip often 3 feet high in good soils, and its flowers are very massive.

King Harold.—Stems 20 inches high; flowers ruby red externally, crimson internally; basal colouring a glowing black disc edged with a thin but clearly defined band of white; a very pretty flower, and a good garden plant; the petals rarely show traces of injury from the severest rainfall.

La Candeur.—Plant of medium size; flowers coloured creamy white, faintly spangled rose-pink externally, and a very faint flush of rose-pink occurs near the middle of each petal internally; a lovely Tulip.

La Tulip Noire.—A singularly coloured Tulip of medium stature; petals a dark purple-black; base quite black; the darkest coloured Tulip known to me.

Loveliness.—This is valued for its clear, colourless base; flowers pale rose, 5 inches across, on stems 20 inches high.

Marie.—A tall variety with very large flowers, purplish crimson externally, scarlet-crimson internally; the margins of the petals incurve, and they are much paler than the rest of the flower, adding greatly to its bright appearance; base coloured Cambridge blue.

Mart Capello.—Small-flowered form, coloured ruby carmine, the three inner petals alone having white margins low down; basal colouring a small blue-black disc.

Painted Lady.—Flowers of medium size, white flamed with heliotrope; the interior colouring is richer than the outer, and the petals spring at right angles from the stems, so that the flowers appear quite flat when fully expanded.

Phyllis.—Stems ruddy and strong; flowers pale lilac, shading to a white base internally, and flamed with rosy lilac externally; a delicately coloured Tulip of medium size, but the petals are too thin to withstand bad weather unharmed.

Ruby.—A very tall variety, with rich crimson, broad-petalled flowers, similar in colour to T. fulgens, and furnished with the blue base of T. gesneriana; its colour is quite dazzling in the sunlight.

Zephyr.—Stems 2 feet long; flowers heliotrope, very large, furnished with a white base internally and externally. It is a good self, not bleached or dull-looking, as in many

Darwin Tulips of this shade, and it stands bad weather well.

G. B. MALLITT.

(To be continued.)

CHRYSANTHEMUMS.

FOREIGN AND OTHER NOTES.

THE Italian National Chrysanthemum Society still continues to issue its neatly printed Quarterly Journal, which has now reached the twentieth number. Among other matter specially relating to the popular flower we notice a reprint of the latest revision of the lists of best varieties for various purposes, which is compiled every year by the Chrysanthemum section of the National Horticultural Society of France, the history and description of the Chrysanthemum, translated from the pamphlet published by the late M. Henri de Vilmorin shortly before his much-lamented death, a short note on dwarf Chrysanthemums, and an article relating to manures.

Le Chrysanthème, the official organ of the French National Chrysanthemum Society, reminds us of the forthcoming congress and show at Lille, which will be held on November 6, 7 and 8. The presence of English growers and amateurs is warmly invited, and, considering the short distance of that town from London, it is to be hoped that the invitation will be accepted by any who can spare a few days at that busy season of the year. The list of members is ever increasing, being now over 700. Great hopes are indulged in that the number may ere long reach 1,000. The society has in contemplation the issue of a catalogue of all varieties actually grown in France at the present time. A more useful work we can scarcely imagine, especially now that M. de Meulenens of Ghent has ceased to publish the one he used to compile a few years ago.

While speaking of catalogues we should much like to see the American society follow suit. During the fourteen years of its existence only one catalogue has been published by that society, and that was as far back as 1892.

Our own National Chrysanthemum Society will now, in the course of a few weeks, be in a position to issue a supplement to its Jubilee edition. The work is progressing rapidly, and as seven years have elapsed since the last publication there should be a good demand for the new work, which will contain the names of all the leading varieties put into commerce since 1896.

Another addition to the literature of the famous flower is promised by the French society. It will consist of a volume compiled by M. Chiffot of Lyons, on the subject of insect pests and diseases. Coloured illustrations will accompany the publication. M. Chiffot is a well known and competent authority on these matters, and has often contributed papers on the subject at the annual congresses of the French society.

The Chrysanthemum Society of America, after holding its first convention and show at Chicago last November, proposes to repeat the experiment on November 10—12 next at New York. Mr. Fred H. Lemon is the recently appointed secretary.

We have just received the record of the last year's convention and show at Chicago. It forms an interesting little volume of seventy-four pages, and contains a very full report of the proceedings, together with verbatim accounts of the papers presented to the meeting. A portrait of the society's president, Mr. Arthur Herrington, is given as the frontispiece. The principal papers are as follows: "American Chrysanthemums in England," by Mr. Harman Payne; "The Colour Scheme in Chrysanthemums," by Professor Cowell; "Border Chrysanthemums," by Patrick O'Mara; "Pompon Chrysanthemums," by John N. May; "Foreign Chrysanthemums in America," by E. G. Hill; "Hybridising Chrysanthemums," by Elmer D. Smith, and several others.

In the bulletin of the French Horticultural Society of London, recently issued, we notice several articles on Chrysanthemums by members. M. M. Madelin, who has resided in this country for

some years, writes on "Le Chrysanthème" and "L'Exposition de Chrysanthèmes à Londres." M. Attilio Scalarandia, son of the head gardener to the King of Italy, who was formerly President and one of the founders of the Italian National Chrysanthemum Society, contributes an article entitled "L'Exposition des Chrysanthèmes tardives." Both of these articles deal with the subject from the standpoint of intelligent young foreigners who are resident among us.

C. H. P.

TREES AND SHRUBS.
WEeping BEECHES.

OF the common Beech (*Fagus sylvatica*) there are several forms, more or less pendulous in growth, to which varietal names have been given, but the best of all is that known simply as pendula, a fine specimen of which growing in Messrs. Dickson's nursery at Chester is herewith illustrated. Though there is a certain

bours. The one purpose for which it stands out above all is to form a living arbour, which in the hottest days of summer affords a delightfully cool retreat from the sun's rays. For this a tall standard is absolutely necessary in order to give the requisite amount of head room, and to ensure this last the main branches, if they show too much of a drooping tendency, must be supported to the requisite height. A little trouble of this kind taken during the earlier stages will be well repaid in the future growth of the specimen, particularly if, as above stated, the formation of an arbour is the object aimed at.

Of other Weeping Beeches the best is the purple-leaved form, which, apart from the colour of the foliage, is in other particulars a counterpart of the preceding kind. The purple hue of the leaves, however, causes it when employed for an arbour to form a more darkened retreat than the ordinary variety. *Fagus sylvatica bornyensis* has the trunk somewhat erect, while the branches are distinctly pendulous. It is well worth growing for the sake of variety, but cannot be compared with the common kind.

Fagus sylvatica miltonensis is somewhat in the

still, practically unknown outside botanical establishments, many trees and shrubs worthy of the best positions in our gardens, from the distinctive elegance of their foliage and habits, or from the profusion with which they produce their attractive flowers. It is but natural that planters should be anxious as to the chances of successfully establishing and growing in Europe trees and shrubs coming from a country embracing such an unusual latitude, with a climate in its extreme north almost arctic, and in its most southern islands sub-tropical; with volcanic hills and mountains where rain falls pitilessly sometimes for days together, and plains but a few miles distant enduring in the summer months an almost torrid heat. That many of these trees and shrubs can be established and cultivated with success may be seen by the photographs and branches cut from specimens shown in the Hall. These trees were planted about 1880 on Kingston Hill, in Surrey, where for the past twenty years they have withstood winters of severity, and latterly summers of unusual drought. To the uncertainty of the suitability of some of the inhabitants of the forests of Japan to our climate must be added (as a reason

for their hitherto not having been more extensively planted) the time required for a full knowledge of a flora so rich and concentrated as that under consideration, due to the comparatively few years it has been possible to travel freely in all parts of the country. So rich is this flora that Professor Sargent has been able to place on record that, in ascending a hill near Sapporo in the northern island only 500 feet above the sea-level, he noticed forty-six species and varieties of trees and shrubs, and, within a radius of five miles of this hill, several others, in all sixty-two species and varieties, probably a larger number than can be found in any other similar area outside the tropics.

How many of these trees and shrubs are actually peculiar to Japan

will probably never be definitely ascertained, so largely have species introduced from China and Corea acclimatised themselves. In a general way this is well known, but having during the past summer had the opportunity of looking through several hundreds of dried specimens from the upper part of the Yangtze Valley sent by a representative of my firm, E. H. Wilson, I was much struck with the great number of trees and shrubs of which he had secured specimens, and which are also found in Japan. The argument one sometimes hears, that planting is not a hobby of the young, and that when its attractions become evident one is too old to plant and hope to live to enjoy the results, does not apply to many of the trees and shrubs of Japan, which flower in from ten to fifteen years after planting in this country, and attain in twenty considerable dimensions.

A warm corner or a gentle slope (preferably sheltered from the east), ample space, and reasonable care in planting are all that is required, and though severe frosts of May and June may in those seasons in which they unhappily occur cripple the flower or check the growth of a few of

WEeping BEECH IN THE NURSERY OF MESSRS. DICKSONS, LIMITED, CHESTER.

amount of individual variation, the general appearance of the tree is well shown. The most prominent feature is the irregular disposition of the principal branches, from whence the minor ones depend like living cascades, the whole in the case of a large specimen forming a huge mass of a rough and rugged outline, which in winter, when devoid of foliage, or clothed with its tender green leaves in spring, as well as in autumn, when they assume their warm russet tint, is equally beautiful. From its naturally pendulous style of growth this Beech to be seen at its best needs to be grafted at a good height, otherwise many of the branches lie on the ground, and a great deal of the beauty of the plant is lost. Like all trees of a very pronounced character, the Weeping Beech should not be indiscriminately planted here and there, but the position assigned it should be well considered. It must occupy a more or less isolated position, as if situated like the specimen shown its handsome yet uncommon features can be seen at their best, whereas if closely associated with other trees a good deal of its beauty is lost, and it is in addition quite out of harmony with its immediate neigh-

way of the variety pendula, but the branches are less decidedly pendulous, having in many instances more of a horizontal tendency. *Fagus sylvatica remillyensis*, like the variety bornyensis, is of Continental origin, and is seldom met with in this country. The branches are markedly pendulous, but as far as I have seen it is one of the least desirable of weeping Beeches. Still, in a collection it affords variety.

Apart from the question of ornament the Beech thrives better than most of our forest trees in light sandy soil, a remark which applies equally to the weeping forms. At Kew, for instance, where the major portion of the soil is of a light sandy nature overlaying gravel, the major portion of the trees are Beech, and among them many fine specimens are to be found.

T.

SOME LESSER-KNOWN JAPAN TREES AND SHRUBS.

ALTHOUGH now nearly forty years since the flora of Japan first received serious attention from the gardeners of Europe and America, there are

the trees, the danger is not sufficient to deter planters.

Amongst the Maples the forms of *Acer palmatum* and *A. japonicum* are in general cultivation and hardly require mentioning; but such distinct species as *A. carpinifolium*, *A. distylum*, *A. nikoense*, *A. Miyabei* (recently found, and only named by Maximowicz in 1888), are hardly ever met with, nor are either, as much as they should be, *A. diabolicum* (pulchrum), *A. pictum*, *A. crataegifolium*, *A. rufinerve*, and *A. capillipes*, common species in Japan, and long introduced to Europe.

A. carpinifolium is evidently extremely rare in Japan, as is *A. distylum*; of the first-named, during a stay of several months, I only saw three trees.

A. nikoense is more common and is widely distributed, and though bearing the name of the beautiful district in which it was first found, is, I think, undoubtedly of Chinese origin. The peculiar thick ternate leaves—silvery beneath, and in autumn of a vinous red on the upper surface (unlike those of many trees, coloured on both sides)—coupled with its vigorous habit, render it a remarkable tree.

A. carpinifolium (the Hornbeam-leaved Maple), first discovered by Siebold, is a most striking and interesting species peculiar in the form and veining of its leaves, and, unless seen in fruit or flower, closely resembling a Hornbeam at first sight.

A. distylum is in this country a noble and handsome tree, producing foliage of great size, in colour rich and glossy. Like the two last-named, it was introduced to gardens by Maries, has proved hardy and vigorous, and superior to some species and varieties in common cultivation.

A. Miyabei, resembling our *Acer platanoides*, has been known to science but a few years. It has successfully withstood the last five winters in this country, and promises well. Coming from the north island, it is accustomed to cold more severe than any experienced here, and at the same time to warmer and brighter summers. A rare tree in Japan, it may be in a few years' time, by its vigour and health, more plentiful in Europe than in its native home.

The only known Japanese Horse-Chestnut, *Æsculus turbinata*, though it has fruited in France and flowered in England, is hardly known as much as a tree so noble deserves to be. In general aspect it closely resembles our well-known species, but is remarkable for its fruits, which are about 2 inches in diameter, and lack the prickles distinguishing the true Horse-Chestnuts.

ORCHIDS.

NEW CATTLEYAS AT THE WOODLANDS.

IN this grand collection the latest novelty is bred from *Cattleya gaskelliana* and *Cattleya guttata Leopoldii*, and is a very handsome plant. The flowers are almost as large as those of *Cattleya Atalanta*, to which it bears some resemblance, but has a more refined appearance than that hybrid. The flowers are of a warm shining rose, and possess

labellum is of a beautiful deep purple-crimson, nearly flat in shape, and folded or fluted, somewhat resembling *Cattleya guttata* var. *Prinzii*. The lobes are of a clear rose on the outer surface, and creamy white with a suspicion of delicate rose on the inner. The flowers are of perfect shape, and the cross makes both a novel and beautiful new *Cattleya*.

At the time of the writer's visit the handsome *Cattleya Fowlerii*, one of the best of hybrid *Cattleyas* (a cross between *Cattleya guttata* var. *Leopoldii* and *Cattleya hardyana*), was in bloom, a grand example, carrying a splendid mass of blossoms. The sepals and petals are of a rosy lilac, and the front lobe of the lip of a rich glowing crimson-purple. The combination of colour in this hybrid is such that it can be classed amongst the showiest and most beautiful of hybrid *Cattleyas*.

One of the prettiest sights I saw at The Woodlands was a houseful of the lovely *Cattleya Harrisonae* in full blossom, the colours of the varieties flowering ranging from the palest rose to the richest of violet-reds. The pure white form also must be included in those which were in flower, the finest variety of which is in this magnificent collection. Altogether this fine houseful of plants made one of the most charming sights imaginable.

ARGUTTS.

LÆLIA IONA SOUTHGATE VAR. (Natural size.)

(Shown by Messrs. Stanley, Ashton, and Co., Southgate, London, and given an award of merit, R.H.S., on the 13th ult.)

LÆLIA IONA SOUTHGATE VAR.

WE are very pleased to illustrate a beautiful variety like this. It was exhibited before the Orchid committee of the Royal Horticultural Society on the 13th ult., when it was given an award of merit. It is a beautiful flower; the sepals are rich rose, and the undulated lip is intense crimson. It was one of the good things shown by Messrs. Stanley, Ashton, and Co., of Southgate, London, whose collection of Orchids is

well known. Of the Orchids shown at that meeting none was richer than *Lælia Iona*.

THE ROSE GARDEN.

THREE BEDDING ROSES OF BRIGHT COLOURING.

IN Corallina, General Schablikine, and Comtesse Festetics Hamilton we have three splendid Roses for bedding or massing. Corallina is unquestionably the best of the three. Its lustrous vigour, brilliant coral red buds opening out to large-petalled, salmon-tinted blossoms are superb, and produce a grand effect. The strong secondary growths which come up from the base of the plants yield enormous

great substance, the sepals and petals being wholly of this exquisite colouring. The labellum, however, is the most striking part of the flower, the front area being of a rich rosy crimson as well as the lobes, which are of the same shade, the column and remaining part of the labellum being snow white and very deeply cleft. There are primrose-yellow markings on the labellum in front of the column and extending towards the base. The colours of rose, white, and yellow are beautifully blended in the labellum, which makes this part of the flower extremely fascinating.

Cattleya × *H. Hannington*.—This new natural hybrid has much of the character in size and shape that one might expect to find in a cross between *Cattleya Harrisonae* and *Cattleya guttata* var. *Prinzii*. The colour of the sepals and petals is of a pleasing reddish rose, studded all over their surfaces with rich chocolate-crimson spots. The

clusters of buds, and it is these growths that are so freely produced that gives the fine autumn blooming character to this and similar Roses. In General Schablikine the growth is denser and somewhat more spreading than in Corallina. It produces a beautiful bud, smooth, well-shaped petals, and there is a peculiar trait in the variety, many of the buds having one, and sometimes more, very pale petals, forming a remarkable contrast to the coppery rose colour which predominates. The expanded flowers are rather flat, more double than those of Corallina, but not so handsome in the half-open stage, and the whitish tinge that pervades the open blossom somewhat detracts from its brilliancy. Comtesse Festetics Hamilton is, in the expanded stage, perhaps the most beautiful of all. There is a charming coppery tint merging to madder or Turkey red, which I have not noticed in any other Rose. If variety is desired and yet a good effect, all three sorts could be planted in one large bed, placing Corallina in the centre, followed by General Schablikine and edged with Comtesse F. Hamilton. I would advise somewhat close planting if the best colour effect be desired. Eighteen inches apart seems close, but not too much so, although 2 feet would do. I am convinced that it is the wisest plan to prune these Roses hard unless one is so situated as to be able to laugh at spring frosts. Those who pruned hard this spring are now reaping their reward in an abundant blossoming.

ROSE GRACE DARLING.

THIS Hybrid Tea is so vigorous that one could easily form a 4-foot hedge of it, and its hardiness is sufficient recommendation to all who are in search of a Rose that can be readily cultivated. Perhaps in June we see Grace Darling in its most superb colouring, the lovely yellow shading which suffuses the peach colour that predominates producing an indescribable effect. We have also a Rose of perfect form, wanting, perhaps, in stiffness of stalk, but it is abundantly free-flowering, and mildew does not trouble it. Where a large bed is planted with this Rose it is an excellent plan to partly bend over some of the growths, and flowers will appear all over the shoots. Some galvanised iron pegs with looped ends are as good as anything for this purpose. These are let well into the ground, and tarred twine is used to bring down the shoots to the required angle. It is not necessary neither is it advisable to bring down the growths quite horizontally. If bent over 1 foot to 2 feet from their perpendicular position is sufficient, and well answers the purpose. Grace Darling makes a splendid standard, differing in this respect to the somewhat stiff form of many of the Hybrid Perpetuals. Under glass, especially in strong heat, this Rose develops a wonderful fresh colouring. I am glad to see that raisers are striving to obtain novelties with the hardiness and vigour of this Rose, and there can be no doubt that the days of weakly growers are numbered.

ROSE ALBERT FOURES.

A WORSE-SHAPED Rose from an exhibitor's point of view it would be difficult to find, yet I am persuaded there are a number of individuals that enjoy beautiful colours rather than form, who would be glad to possess this charming variety. The yellow colour is heavily shaded with peach and orange, so that at first sight the peach colour prevails, but on closer inspection the yellow tint is seen to be very pronounced.

ROSE FRANCOISE CROUSSE.

THIS is a splendid acquisition to the red climbing Tea-scented Roses. The buds are long and tapering, which makes the variety a most valuable one for cutting, apart from its brilliant effect on a wall. The colour is quite a fiery scarlet-crimson, certainly the best high-coloured climbing Tea Rose we have. It appears also to bloom well. The flowers, which are produced at the end of the long growths, come in clusters of from five to eight. Until we have a climbing sport of Liberty this variety will supply

a long-felt want. Though it is scarcely so rampant as Reine Marie Henriette, the growth is sufficiently vigorous for any ordinary wall.

ROSE MME. PIERRE COCHET.

THIS is one of those delightful golden yellow Roses that never fail to charm. Although placed among the climbing sorts, I think its most useful stage is rather as a strong bush, or better still as a half-standard. On the Hedge Briar the variety makes a splendid large head, but more compact in growth than many of the climbing sorts grown in a similar way. Just now such plants are yielding a number of the elegant buds which are of far better shape than those of W. A. Richardson. Mme. Pierre Cochet is often described in catalogues as golden-yellow, shading off to yellowish white. My experience has been that the buds are of the golden yellow colour throughout. Why described as a Noisette I cannot imagine. It is quite as much a Tea Rose as Mme. Falcot.

PHILOMEL.

ROSE FELICITE PERPETUE.

It is almost needless to write a word about this beautiful Rose—at least it should be so, for everyone who has a garden ought to have it clustering in some corner, for the good reason few varieties are so hardy and free and beautiful in all ways. It is also more "perpetual" than many climbing Roses—Félicité Perpetue belongs to the Multiflora race—that is, it keeps up a scattered succession of flowers during the summer, though I cannot understand why Rose growers call their flowers perpetual at all when at the best certain varieties only bloom from June till October, given fine autumn weather. Félicité Perpetue, with its wealth of white bloom, is a delight in the garden. I have planted much of it against old orchard trees, and am rather sorry for the trees, the Rose is so rampant and leafy. I fervently hope raisers of new Roses will strive and get an autumn-flowering race of climbers, such as Aimée Vibert. I happened to be away from home when the single Roses were in beauty.

VIATOR.

ROSE FELICITE PERPETUE. (From a photograph by Miss Willmott.)

GARDENING OF THE WEEK.

INDOOR GARDEN.

FUCHSIAS.

EARLY in September take cuttings from the young growing shoots of such varieties as it is desirable to increase. Any plants from which cuttings are wanted, and that have not produced suitable wood, should have all the flower-buds picked off and be placed in a warm-growing atmosphere to encourage young growth. Cuttings should be inserted in small pots filled with soil composed of equal parts of light loam and leaf-soil sifted through a $\frac{1}{2}$ -inch mesh, with a little sand added and pressed firmly into the pots and surfaced with silver sand. If placed on a spent Melon bed in a frame, which must be kept close and shaded in bright weather, they will root very quickly. It is desirable to syringe them lightly two or three times a day during dry weather should they drop much. As soon as rooted put them into small pots singly in a close frame or pit, and if grown on in a light warm house through the winter they will by the spring make plants suitable for any purpose. Prepare a dozen or two plants of a free habit of growth for training up rafters. If selected of dissimilar colours these make very attractive objects, and flower all the summer.

CHRYSANTHEMUMS

that were planted out on a screened border with the view to being lifted and potted up a little later are, in consequence of the wet, cold season, in a very unsatisfactory condition. These should be lifted and potted up at once, and placed in a vinery or Peach house where the fruit is all gathered. If kept syringed until they have recovered from the effect of the lifting they will produce better results than if left out any later. *Salvia splendens* and variety that may have been planted out for winter flowering should now be potted up and placed under glass.

CALCEOLARIAS.

As many of these as are required should have been pricked off some time ago, and the most forward plants may now be potted into 3 inch pots, a compost of loam and leaf-soil in equal parts, with some coarse sand and crocks broken up rather fine, but not sifted, suiting them. Cold frame treatment must be continued, keeping the plants well up to the glass, and until they are established ventilate the frame carefully. Keep a sharp look out for slugs, which evidently regard the young plants as a delicacy. These, together with *Cinerarias* and *Primulas*, are this year much later than usual, and consequently require closer attention.

CARNATIONS

intended to flower through the winter, if not already under glass, should be placed in a cool house, and, except the earlier batch, may have the points of the strongest shoots pinched out.

ACHIMENES, GESNERAS, AND TYDÆAS.

As these pass out of flower they should be placed in a light, dry house, where air can be admitted freely, giving them sufficient water only to prevent the foliage from drying off prematurely, the object being the thorough ripening of the tubers. *Griffinia hyacinthina*, the flowering of which depends largely on the ripening of the bulbs, requires somewhat similar treatment, the ripening process being more protracted.

Wendover.

J. JAKES.

FLOWER GARDEN.

PROPAGATING BEDDING PLANTS.

THIS important work must be pushed forward without delay. The completion of the stock of zonal *Pelargoniums* should be the first consideration. Late cuttings of these either fail to strike or make so little root action that they are troublesome to keep through the winter, and make but poor plants for planting out in the spring. After the heavy rains we have had the cuttings will be

very sappy. They should therefore be allowed a little time to dry before insertion. At this date cutting boxes should, if possible, be placed under lights so fixed that they will throw off the rain, as it will not do to let them get saturated with wet. Ivy-leaved *Pelargoniums* are better left until rather late in the season before taking cuttings. These will root readily enough, and do not begin to run until the winter is past. By this means we get better plants for boxing or potting off, and they are also better for planting out into their permanent quarters. Cuttings of such things as *Heliotrope*, *Verbena*, *Coleus*, *Alternantheras*, and *Fuchsias* will need artificial heat. A moderate hot-bed should be made up of stable manure and leaves, and allowed to cool slightly before being put into use should there be a half-spent bed at hand from which something else has been discarded. Such a bed comes in very useful at this time of the year for many things besides those mentioned. A few stock pots of *Ageratum*, *Cuphea*, and *Salvia fulgens*, where these plants are in favour, should be struck. They are easily wintered in any dry place and where frost can be excluded. *Mesembryanthemum cordifolium* variegatum needs different treatment to most things struck from cuttings. It will not stand a close, moist atmosphere, and does not require shade. It will strike best in cutting pots of very sandy soil placed on a shelf in an airy and light house.

CIMICIFUGA JAPONICA.

This grand autumn-flowering plant is having a good time of it. I never saw the plants in the herbaceous border look more promising. The late rain with the hot, humid atmosphere suits them well. These should now have a good soaking of liquid manure to hasten on their flowering season, as we sometimes get frost towards the end of October. This cuts them off in the height of their beauty.

T. B. FIELD.

Ashwellthorpe Hall Gardens, Norwich.

KITCHEN GARDEN.

CABBAGE.

THE ground should be prepared for planting out the main spring crop. Assuming that the main crop Onions are sufficiently ripe for lifting, this plot would be a good one for the Cabbage, and if it were heavily manured and deeply dug or trenched for the Onions no more will now be needed. A good dressing of soot or wood ashes or both should, however, be given and the ground dug a spit deep. To avoid a too-rampant growth the ground must be well trodden. Over-luxuriance in the plants before winter makes them susceptible to injury from sharp frosts and snow. If the ground intended for the Cabbage bed has recently carried an exhaustive crop and is impoverished it should, of course, receive a rather heavy dressing of stable manure, as well as a dusting of soot before digging. After treading and raking level shallow drills should be drawn. The distance the rows are apart must be regulated by the variety grown. For large Cabbage, such as *Flower of Spring*, they should be 2 feet apart and 18 inches from plant to plant, whilst for the smaller kinds 18 inches by 15 inches will suffice. Dibble the plants carefully into the drills and give a good watering to settle the soil about the roots. Watch closely for grubs, or, as they are more commonly called, leather jackets. They are very destructive, as they eat off the plants just below the surface. By going over the bed once in two or three days it will be seen where the grubs are at work. They should be searched for and destroyed and fresh plants put in. Any neglect in this matter often results in a patchy bed in spring. Some plants should be pricked out on a sheltered border for filling up gaps next February or March.

HARVESTING ONIONS.

On the proper ripening and drying of the bulbs depends in a great measure their keeping qualities when stored. As soon as the tops turn yellow and fall over the bulbs should be pulled with the hand and laid in lines on their sides, turning them carefully every other day if fine. Should the ground be required for another crop at once the

Onions may be lifted and carried to any spare plot of ground for maturing, or in the event of wet, dull weather prevailing they may be laid in pits or frames and the lights kept over them, but admitting air freely both top and bottom to ensure free circulation. Care should be taken not to bruise the bulbs in moving them from one place to another.

CELERY.

Much attention will be required at this season in earthing up the plants as they become large enough. In the first place all side shoots and weeds must be cleaned off, and see that the plants are well supplied with water before any earth is placed against them. The foliage must be dry and the stems of each plant gathered together and held firm by one pair of hands whilst another places the soil carefully against it with the spade. It should then be well pressed with the hands. Let the work be done piece-meal, i.e., do not place too much soil round the stems at one operation. By banking up the plants too early autumn rains are prevented from reaching the roots at the time when they would be of inestimable benefit.

H. T. MARTIN.

FRUIT GARDEN.

AUTUMN TREATMENT OF FRUIT TREES UNDER GLASS.

I BELIEVE it may be safely asserted that many cultivators overlook the necessity for closer attention to the requirements of various kinds of fruit trees and Vines after the crops have been perfected. For several seasons I have been paying close attention to this important subject, and, after various experiments, have arrived at the conclusion that it is impossible to grow really fine fruit on trees that have been much neglected any time from the fall of the leaf to the flowering season again; in other words, that more depends upon the size and perfect formation of the bloom buds than we, as a rule, are aware of. According to my experience, the size and shape of the future fruit is more determined by the autumn treatment of the trees or Vines than by the treatment given when the fruit is swelling off. Large and perfect flowers, or bunches of flowers, may, with ordinary good treatment, be grown into large and perfect fruit or bunches of fruit as the case may be, but undersized or malformed blossoms cannot by any treatment be grown into full-sized handsome fruit. If any proof of this is required, I need only direct your readers' attention to the state of many Apple, Pear, and Plum trees this season. Where the strongest and best-formed flowers escaped destruction by frost, there are to be seen fair crops of fine, well-shaped fruit, but where these were destroyed, the small, late, and in many cases imperfectly formed blossoms were followed by corresponding inferior fruit. A superficial observer might naturally form the opinion that a strong, healthy fruit tree with only a small quantity of fruit set, would swell these to a great size, but no such thing occurs, unless, indeed, such fruit resulted from the best-formed flowers. To a certain extent Dame Nature determines the quantity of our outside fruit crops, but the case is very different under glass, as here we are in a position to be more independent of climatic changes, and if we fail to grow good fruit it is usually our own fault.

Grape Vines, Peach, Nectarine, and Fig trees in particular, should never be allowed to become dry at the roots, as a few days neglect in this respect may be most detrimental to the next year's crops. Not only should all these be kept regularly supplied with water, in order to ensure a perfect formation of buds, but they should also be given liberal supplies of liquid manure, thus assisting the trees or Vines to recoup their strength after the exhaustive maturation of the crops. In most cases the root action is going on more briskly after, rather than before, the cessation of active top-growth, the whole aim, if I may so put it, of the plant being to store up as much food and to produce as many fibres as possible to begin active life with afresh the following season. If then, we allow the foliage to become badly overrun with spider and other pests (these oftentimes being the natural

consequence of neglect at the roots), and do not encourage the formation of plenty of fibres, we seriously injure our future fruit prospects. Many complaints are annually heard of the Peach and Nectarine trees under glass dropping a greater portion of their blossoms in the spring, and in most cases this is entirely due to either extreme poverty or dryness at the roots during the autumn and early winter months, or else very loose borders. We are not all in a position to easily flood our borders with water, but most of us can contrive to give frequent and moderately heavy soakings and that is all that is necessary. The less water available the more need for frequent applications. This, at first sight, may appear inconsistent, but I find that if we anticipate dryness, a moderate supply of water is sufficient to thoroughly moisten the whole border, whereas, when once a border gets thoroughly dry, it requires a great amount of water to moisten it again, and much runs away without doing a proportionate amount of good. After our trees have been cleared of fruit, the borders are cleared of the litter mulching, we have the surface very lightly broken up with a fork to prevent cracking and they are given a good soaking with diluted farmyard liquid manure.

Madresfield Court Gardens.

W. CRUMP.

ORCHIDS.

MANY plants are now in various stages of growth, and will be approaching maturity. It will therefore be necessary to look through the various homes and note each species, and give the treatment best suited to their requirements.

In the Phalaenopsis, stove Orchid house, warm and cool Cypripedium houses, the majority of plants will be growing freely, and must receive every encouragement to do so. Maintain a nice moist and growing atmosphere. Such plants as *Celogyne dayana*, *Cypripedium insigne*, and other strong growing kinds should be watered occasionally with weak liquid farmyard manure. *Celogyne massangeana*, *C. swaniana*, *Deudrochilum filiforme* and others that have finished must be kept slightly drier at the root. The *Cynoches* and *Catasetums* will need sufficient water only to keep them plump and healthy, with the exception of the *Catasetums* that have flower spikes, which should be moderately watered until the flowers are removed. When the leaves have fallen, they should, with the *Cynoches*, be placed in a light position in the *Cattleya* house and little water at the root will be needed.

DENDROBIUM HOUSES.

Dendrobium wardianum, *D. crassinode*, *D. thyrsiflorum*, *D. Farmeri*, *D. suavisimum*, *D. chrysotoxum*, *D. aggregatum*, and others that have finished growth should be given more sunlight, air, and less moisture in the atmosphere with a slightly cooler temperature, in order to ripen the pseudo-bulbs as well as possible. Others that have not finished must be kept in the same hot, moist, and growing temperature. Plants that have finished one bulb and are making new growths should, if required to bloom, be treated as recommended for resting plants. If the flowering is of less importance than increasing the stock allow them to remain in the hot house and properly finish as many bulbs as possible. *Cyrtopodium Andersoni*, *C. punctatum*, and variety *St. Legerianum*, if grown in this house and growth is completed, should be placed at the lightest and coolest end of the house, or given a light position at the warmest part of the *Cattleya* house. Gradually reduce the water supply unless they have become deciduous when little will be required.

CATTELEYA HOUSES.

Cattleya gigas, *C. Rex*, *C. gaskelliana*, *C. Forbesii*, *C. Loddigesii*, *C. guttata*, *C. granulosa*, *Lælia digbyana*, *L. elegans*, and others that have finished growth should be placed in the lightest, coolest, driest, and airiest part of their respective houses, and water given at the root in quantity according to the plumpness of the pseudo-bulbs. *Lælia purpurata*, *L. tenebrosa*, *Cattleya Lawrenceana*, a vast number of hybrid *Cattleyas* and *Lælio-Cattleyas*, *Zygopetalums*, *Sobralias*, and other plants growing freely must be treated

according to their condition. The last named should be occasionally watered when growing with weak liquid farmyard manure.

MEXICAN HOUSES

The Mexican *Lælias* should be prayed over on bright days only, with liberal applications of water to the root until growth is complete, after which much less will be needed, except those with flower spikes, which must not suffer for want of it until they have passed out of bloom. *Odontoglossum citrosum* and other growing plants must be moderately watered and have every encouragement to fully develop their growth. *Celogyne cristata* will need an abundance of water, with weak liquid manure, at the root until the bulbs have fully developed. *Odontoglossum-læve*, *Anguloa Clowesii*, *A. Ruckeri*, *A. uniflora* and other plants inactive must be kept on the dry side.

COOL INTERMEDIATE HOUSE.

Many inmates of this division have not yet completed their growth, therefore water should be given according to their requirements, and the same general treatment carried out. Such strong growing plants as *Celia macrostachya*, *Cymbidium Lowi*, *C. Lowio-eburneum*, *C. Eburneo-lowianum*, *C. tracyanum*, and *C. gammianum* will be benefited if watered with weak liquid manure until growth is finished. *Oncidium Mantinii*, *O. Forbesii*, and others that have their bulbs made up will need less water, but those with spikes must not be allowed to become very dry at the root.

GENERAL REMARKS.

All plants should now be given as much sunlight as they are able to stand. The Mexican *Lælias* and *Dendrobiums* will need little shade, and this only in the lightest of houses for a short time on bright days. The blinds on the *Cattleya* houses should not be lowered until really necessary to prevent scorching or turning the foliage yellow, and pulled up as early as possible in the afternoon. The *Phalaenopsis*, *Cypripedium*, cool intermediate and *Odontoglossum* houses must be shaded on bright days for some time to come, yet here a little sunlight, when not powerful, will be beneficial even to these. Where blinds are used all permanent shading should now be removed. In all departments less atmospheric moisture will now be necessary, especially where it is important to ripen the pseudo-bulbs.

F. W. THURGOOD.

made, to take the form of his portrait. This is an oil painting by Mr. Chas. Wynn Ellis. It is an excellent likeness of Mr. Smith, and a high-class work of art. The presentation took place in the presence of most of the subscribers on the occasion of the annual exhibition of the society at The Grange, by the president for the year, Mr. Tresham Gilbey, in a few well-chosen words. Mr. John Barker and Sir Walter Gilbey, Bart., also alluded to the valued services of their late honorary secretary in giving so much of his time to the work of the society. In thanking the subscribers for their kindness, Mr. Smith alluded to the work done in the past, and he was still willing to aid the society by his advice and help as far as he was able in the future, and the very pleasant function terminated with thanks to the artist (who was present) for his admirable work.

J. DOUGLAS.

THE INDOOR GARDEN.

ZONAL PELARGONIUMS.

WHAT a contrast these usually brilliant flowering plants present just now at Chiswick. Outdoors are many plants in beds, and almost as many varieties. They make a poor show. But close by in a span-roof greenhouse is a display in pots,

double and single, of singular brilliancy. Could plants in beds outdoors be induced to bloom as these do in pots under glass the effect obtained would be startling. Generally, zonal Pelargoniums are not seen in good form this season. Essentially warmth loving, they lack the sunshine needful to produce the quantity of flowers seen in pot plants under glass. Abundant rains and leaden skies do not suit them, except to produce coarse growth and leafage in abundance. Begonias do so much better as damp weather plants. Outdoors zonal Pelargoniums, however, do give great compensation in the winter, as their well-prepared plants in pots give rich profusion of bloom and colour of the most

brilliant description. It is a pity that the zonal Geraniums are not more grown by amateurs for their winter flowers.

A. D.

MR. WILLIAM SMITH.

WORKERS AMONG THE FLOWERS.

MR. WILLIAM SMITH.

MR. SMITH is well known as an ardent florist amongst the members of the National Auricula Society, but it is not generally known that our good friend has been honorary secretary of the Bishop's Stortford Horticultural Society for the long period of thirty-three years. Acting on medical advice, Mr. Smith has been compelled to resign his position in connexion with the society, and the committee could do no other than accept his resignation. The principal inhabitants of the town and neighbourhood felt that Mr. Smith's long and valued services should be recognised in a substantial manner. It was ultimately decided that a presentation should be

THE MOST USEFUL PALMS.

PALMS were very popular for various purposes on the Continent long before they became generally used in this country; indeed, the almost universal demand for them here which now prevails dates from the period of the Franco-German War, when so many of the richer class of those countries sought shelter in England, and naturally brought with them their taste for such plants as Palms and Bromeliads. The last named were never grown to any great extent, but Palms from that time increased in popularity year by year, and now some are grown almost by the acre, and disposed of for various decorative purposes, being welcomed in the palace of the prince as well as in the most humble cottage.

There are a great number of Palms in cultivation, but those principally grown are comparatively few. Of the others some require special treatment, others are too slow in growth, while some are not suffi-

ciently ornamental. In any selection the first place must be given to the

Kentias, especially *K. belmoreana* and *K. forsteriana*. The first named is the dwarfier and more finely divided of the two, hence it is particularly sought after in a small state, but the larger and bolder fronds of *K. forsteriana* render it in the shape of large plants more effective than the other. The dwarf growing *K. sanderiana* forms delightful little specimens in 5-inch pots. A well-furnished plant will stand about 15 inches high, each frond having nearly a couple of dozen pinnae, alternately arranged in two opposite rows. These pinnae are about one-third of an inch wide and 8 inches to 10 inches long, so that the frond is broader in proportion to its width than in most Palms of this class. A notable feature is the production of young shoots from the base of the plant, and the axils of the bottom leaves. For table decoration this *Kentia* has of late become very popular. Of the species referred to *K. belmoreana* and *K. forsteriana* will grow in a greenhouse, while *K. sanderiana* needs the cool end of the stove or an intermediate house.

Arecas.—Of the many *Arecas* that are in cultivation *A. Baueri* from Norfolk Island, and *A. sapida* from New Zealand, will thrive in a greenhouse, while *A. luteocens*, though a native of Madagascar, will keep in health for a long time in the warmest end of the greenhouse, but it will not grow much under these conditions. Before the *Kentias* were introduced this was one of the most popular of decorative Palms.

Chamærops.—One species of this genus, viz., *C. excoelsa*, known also as *Trachycarpus excoelsa*, a native of China and Japan, is one of the hardiest of all Palms, and large specimens that have withstood the winter for many years outside may be often met with. A pretty little fan Palm is the South European *Chamærops humilis*, which when established produces several offsets from the base of the plant. The leaves are clothed when young with silvery scales, which to a great extent disappear with age. It is quite a greenhouse Palm.

Cocos.—An extensive genus, the most valuable for decorative purposes being *C. weddelliana*, which, though a native of Brazil, will grow in a lower temperature than is generally supposed. It will make more rapid progress in a stove, but grows well in an intermediate temperature, or even in a greenhouse; indeed, I have had one for four years in a dwelling-house, and it is now a picture of health. Overpotting must in the case of this *Cocos* be strictly guarded against.

Corypha australis.—One of the fan Palms, with spiny leaf-stalks, and a hard, unyielding style of growth. Its great merit consists in the fact that it is less affected than most Palms by cold, harsh draughts, hence for corridors and such places it is much appreciated.

Daemonorops.—Palms that will grow freely in a stove temperature, but they will only stand in the greenhouse during summer. The fronds are much divided, and a well-grown specimen is very handsome. Their nomenclature is greatly confused, but *D. fissus* and *D. palembanicus* are two of the best.

Geonoma gracilis.—Somewhat like *Cocos weddelliana* but far more graceful. It is extremely handsome in a small state. The cultural requirements are the same as for *Cocos*, except that I cannot induce the *Geonoma* to thrive in a dwelling-house.

Latania borbonica.—This fan Palm was very popular at one time, but of late years it has not been so much in demand. It is a native of China and Japan, and may be grown in the greenhouse.

Licuala Muellieri.—A comparatively new Australian Palm that seems likely to be valuable for the greenhouse. The roundish fronds are in a young state at least split up into several segments. The colour is a bright green, veined with a deeper tint.

Phoenix.—Considerable interest is centred around the Date Palm (*Phoenix dactylifera*), but it is not worth consideration for decorations. One of the hardiest and most useful of all is *P. canariensis*, which for conservatory decoration or for placing outside during the summer is unsurpassed. *P. reclinata* from South-East Africa is also very useful,

while perhaps the most handsome of all is *P. rupicola*, but for this stove or at least intermediate house treatment is necessary.

Rhapis flabelliformis.—This Palm pushes up numerous suckers, so that in time it will form a mass of stems. It is handsome either in this way or with a single shoot, for the leaves are always very graceful. A greenhouse temperature meets its requirements. A miniature form known as *R. humilis* is a charming plant, but rare.

Seaforthia elegans.—Before the *Kentias* were introduced this was much grown, but, except as large specimens (trees in fact), the *Seaforthia* now occupies second position.

The nomenclature of Palms has undergone such a change of late that I have herewith referred to them under the names by which they are generally known.

(To be continued.)

NURSERY GARDENS.

MR. ANTHONY WATERER,
KNAP HILL, WOKING.

KNAP HILL NURSERY is widely famous for its Rhododendrons, and a visit here in Rhododendron time is full of interest. The long drive, bordered on either side by huge masses of Rhododendrons in flower is a wonderful sight. It may safely be said that in its way it is unique in this country. The profusion of the plants at Knap Hill is remarkable, and after seeing how vigorously the Rhododendrons grow and how finely they bloom, one wonders no longer at the reputation of the Knap Hill Nursery for these plants. Not only are the plants good, however, but Mr. Anthony Waterer is especially careful to grow only the best varieties. Those that receive Mr. Waterer's commendation may be relied upon to give satisfaction in the garden, they are good garden plants. Mr. Waterer's standard of a good Rhododendron is very high, not only must the growth and hardiness of plant, size, form, and colour of flower be satisfactory, but the trusses of bloom must be erect, must look one in the face as it were, and this is what he strives to obtain in all the varieties originated at Knap Hill. A Rhododendron loses its value as a garden plant when the flowers droop so that one is unable to see them without holding them up.

There are numerous beautiful varieties at the Knap Hill Nursery that Mr. Waterer will not send out simply for the reason that the trusses of bloom are loose and the flowers droop. There are also many more that do come up to Mr. Waterer's standard and these are largely grown. Rhododendrons are everywhere. On either side of the long drive previously mentioned there are acres of them, bush plants in various sizes chiefly, with standards here and there. The standard Rhododendron is much more handsome than most plants in standard form, especially when they attain some size. In the centre of beds in the shrubbery, and even as a specimen lawn plant, they are most effective. We saw many plants of seedling Rhododendrons still unnamed, that were the results of years of careful hybridisation, and some of them, doubtless, will make a name for themselves before long, for they have all the characteristics that distinguish a good variety.

It would serve no good purpose to mention numerous varieties, and although it is difficult to individualise, we would particularly note Mrs. Samuel Simpson, rich orange and purple, a lovely flower; Mrs. Anthony Waterer, probably the best white, the beauty of the white flowers is accentuated by the rich yellow blotches on the petals; and Michael Waterer, a very fine crimson. The original plant of Rhododendron catawbiense, about 12 feet high and 15 feet through, as in the Knap Hill Nursery, this, and a huge bank of the variety *Album elegans*, some 15 feet high, are perhaps, the most remarkable among many grand Rhododendrons. Azaleas, too, are largely grown at Knap

Hill, and at the time of our visit some traces of their gorgeous colouring still remained. They, however, have not been so good this year on account of the cold ungenial spring. The Knap Hill Azaleas are famous the world over for the wonderful colouring and shape of the flowers. Equally as remarkable as the Rhododendrons, however, are the trees and shrubs. The Nursery contains some grand old specimens of, for instance, *Fagus antarctica* (the evergreen Beech), *Vitis Thunbergii*, *V. parviflora* (20 feet high), golden Spanish Chestnut, Fern-leaved Beech, variegated Beech, and Willow-leaved Oak.

Never have we seen such a splendid lot of golden Yews, plants varying in height from 4 feet to 10 feet were perfect in form, density of foliage, and rich colouring. Several acres are planted with golden and variegated conifers alone, and all are of the richest colouring. The golden Yews were especially fine, we have never seen them better coloured. Other conifers noticeable were the Knap Hill Savin, a handsome variety of *Juniperus Sabina*, *Abies Douglasii*, Colorado variety, with rich green foliage and of compact habit of growth; *Cedrus atlantica glauca*, there are two forms of this, one of which is much superior in colour and habit of growth, and the weeping varieties of *Cedrus atlantica*. The Hollies, too, are another feature in the Knap Hill Nursery, and especially fine is Perry's Weeping Holly. These, of course, are just a few of the most select as will be understood when we say that the Nursery covers between 300 acres and 400 acres.

THE FRUIT GARDEN.

A COMMON APPLE PLAGUE.

APPLES are very scarce this year; there is not a tree bearing anything like a crop but what casts some of its fruits before they are ripe through the latter being bored by that common base of Apple growers, the caterpillar of the codlin moth. It matters not whether Apples are plentiful or scarce, this pest is always on the war-path, but it is in a season like this that its ravages are most evident, because we can ill afford to waste a fruit, especially of varieties possessing any qualities for keeping. "Windfalls" is the name commonly applied to Apples that drop early from the trees, but when they are picked up it may be observed that the majority of the fruits have the tell-tale hole at the side which denotes the passage of the grub. It is rumoured that a new remedy for codlin moth caterpillar is forthcoming from a well-known source, and if it turns out to be really effective the introducer will earn for himself the blessings of Apple growers in general. H.

EARLY PEARS.

THE season in which English-grown Pears are available for dessert covers a long period of the year, beginning in July and ending in April or May. The value of this fruit in the household has been long recognised, and yet its culture, especially in small and moderate-sized gardens in England, is on a very small scale. This is regrettable, for the tree, if suitable varieties are selected, is as free in growth as the Apple or the Plum, and quite as much at home, whether in the garden, the orchard, or even the shrubbery or pleasure ground. As a garden and orchard fruit the Pear is not sufficiently grown, and for the shrubbery and pleasure grounds it is practically ignored. Its foliage in the autumn assumes a richness and variety of colouring possessed by few other trees. So beautiful is the foliage of some of the varieties in autumn that I have on many occasions used them effectively for wreathing and dressing the dining-table, the combinations of the various shades of green, gold, and crimson being very beautiful when lighted up at night. I mention this in order to advocate its more extensive use as an ornamental tree for the shrubbery and pleasure ground. It is far and

away better than such things as common and Portugal Laurels, green Holly, Yew, Privet, and other such ordinary subjects as the majority of shrubberies are planted with, to say nothing of the value and beauty of its fruit in summer, autumn, and winter.

As the best season of the year is now approaching for the planting of these trees—late October, November, and December—let me advise those possessed of gardens to have a look round and note how they stand as regards the number of trees of this valuable fruit they may be possessed of, and whether it is not desirable to add them to the garden and orchard, but more especially for the embellishment of the shrubbery and pleasure ground. Tall standard trees should be planted in shrubberies, where they can be seen to advantage above shrubs of lower growth; but trees of pyramidal growth may be introduced with advantage as single specimens for the lawn.

The following twelve early varieties are amongst the best, and are named according to earliness of ripening: Doyenné d'Été, a free-bearing sort. The fruit is small, but very sweet; ripe in July. It must be gathered immediately it begins to turn yellow, and if grown for the purpose of sale should be disposed of as gathered from the tree. This remark holds good as regards all the early varieties, as once they are quite ripe they soon decay, and of course are of no value when over ripe; Beurré Giffard, Jargonelle, Clapp's Favourite, Souvenir du Congrès, Citron des Carmes, Williams' Bon Chrétien, of which we give an illustration.

This old and well-known variety, for use at the end of August and early in September, is undoubtedly still the best sort to grow in quantity, whether for home consumption or for sale. The varieties here enumerated will succeed well in the open ground as dwarf bushes, pyramids, or standards.

Fondante d'Automne, Mme. Treve, splendid quality, fine appearance, and large size; one of the best of late introductions; Beurre d'Amanlis, Souvenir du Congrès, a handsome highly coloured Pear; Triomphe de Vienne, a Pear of recent introduction, and for quality, size, appearance, and productiveness deserving first place among September Pears. The above are in season from July to the end of September. A further list will be given in an early number of Pears in season from the end of September to Christmas. OWEN THOMAS.

worth room in all gardens, as it is so distinct from other vegetables, and when cooked in a young state is delicious.

PEA SUTTON'S MATCHLESS MARROWFAT.

This splendid Marrow Pea was one of a very limited number that received a first-class certificate for its cropping and eating qualities when grown for trial at Chiswick with a large number of other sorts. I am sure that any Pea that passes this severe test when grown under somewhat adverse conditions as regards soil and position will in well-tilled gardens be a splendid acquisition. For general use Matchless Marrowfat is well named. It is not unlike in size other large Marrows, but the pods are better filled, often containing ten to twelve Peas. These are large and of a splendid colour when cooked. All Marrow Peas lack the quality of this one, and it is well named Matchless on this account. The haulm also resists mildew splendidly, even in the north, where the rainfall is usually very great. The growth is robust, a great gain in poor soils or exposed positions. The Matchless grows freely when given

PEAR WILLIAMS' BON CHRETIEN.

plenty of room, and being dwarf (only 4 feet) it is more valuable, as it crops low down on the haulm. It is excellent for August or September.

A NEW RUNNER BEAN, HACKWOOD SUCCESS.

At a recent meeting of the Royal Horticultural Society the fruit committee unanimously gave the above Bean an award of merit without trial at Chiswick, which is the usual procedure unless the exhibit is quite above the average. There can be no question whatever but that the Bean staged by Mr. Bowerman of Hackwood Park Gardens, Basingstoke, was certainly a most valuable addition to this class, and I have never seen a better cropper or a better shaped pod, considering the quantity of pods in a cluster. It crops enormously.

The committee had no opportunity of testing the flavour, which many will say is a most important detail, but in cases of this kind it is readily seen that a pod of the texture of the Hackwood Success would be of first-rate quality. Many of the pods were quite 12 inches long and remarkably fleshy; the seeds were not large or prominent. There can be no doubt that such an excellent cultivator as Mr. Bowerman will have found this new Bean most valuable. It will soon become a great favourite owing to its cropping and splendid shape. There are few small pods, and the colour is a deep green. G. WYTHES.

A GLOOMY OUTLOOK FOR POTATOES.

DISASTER seems to have followed disaster throughout the present season, which possesses the unenviable reputation of being amongst the worst on record for farmers, gardeners, and fruit growers, and now it is a cheerless duty I have to perform in writing gloomily of the Potato crop. At one time we were very hopeful about the Potatoes, for in spite of the fact that a few varieties produced spindling growth and did not look promising, the majority presented that healthy, vigorous appearance which indicates an abundance of tubers.

Gloomy skies and wet sunless days, however, have brought on the disease. Some thoughtful growers sprayed their Potatoes with Bordeaux mixture as a means of prevention, and are hopeful that the operation did some good, but the rain which fell every day washed off the mixture, and sprayed plots are by no means free from the disease. In the south of England I never saw Potato haulm go off more quickly than during this year. At the beginning of August, with the exception of early varieties, the growth was green and vigorous, and then the tell-tale blotches appeared, the foliage gave off an obnoxious odour, and a week or two later nothing remained of the tops but black and withered stems.

Opinions differ as to the best course to pursue when Potato haulm is badly struck with disease. Some advise cutting it off as a means of checking the spread of the plague, and if this course does no good it cannot do much harm, considering that the disease causes the tops to die away of their own accord. Others advise digging up the tubers, which is all very well in the case of varieties that are ripe and provided the weather is suitable, but Potato lifting is out of the question when it rains every day and the garden is a quagmire. Even if conditions were favourable I fail to see much wisdom in digging main crop Potatoes several weeks before they are ripe as a means of preventing disease, and experience has taught me that in such cases the disease is apt to spread amongst the tubers more rapidly after being lifted than if they were left in the ground till fully matured.

The fact of the matter is that we are largely victims of circumstances so far as Potato disease is concerned, and our only hope is that though the tops are gone the tubers may escape.

It is a forlorn hope I know, for amongst the Potatoes that are being dug for daily use diseased tubers are continually being unearthed, and this is anything but a good sign. Spraying with Bordeaux mixture is a partial remedy when used in time, but it is not a whole one as this year proves, and it is hard to see how it can be when the rain washes it off as fast as it is applied, and the sodden state of the ground prevents one getting on it to perform the operation with any degree of comfort.

Disease-proof varieties are fairly plentiful—in catalogues—but in gardens they do not exist; at any rate, not in such seasons as the present one, and the disease-proof Potato has yet to come. I am prepared to admit that some varieties are more liable to disease than others, and it is wise of growers to discard those which suffer the most. Not being disposed to pay the absurd price asked for seed tubers of the sensational Northern Star in the spring, I am not growing it, but should be interested to learn how it is standing the strain in regard to disease. If I am not very much mistaken it is the watchful men who will make the most of their Potatoes this year, and by watchful men I mean those who seize rare opportunities when the soil is dry for lifting the crop, and being careful to pick out every tuber that is at all affected with disease. There must be none of that packing away in clamp or store, and dismissing the Potatoes from the mind, such as is possible in

THE KITCHEN GARDEN. IMPORTANT VEGETABLES.

THE CUSTARD MARROWS.

CUSTARD MARROWS of the older varieties are not so much grown as the common long or oval type, and this is not surprising, as it does not crop so freely and is later in bearing. It will be interesting to note the different forms of Marrows now on trial at the Royal Horticultural Society's gardens at Chiswick. I think from close observation that the best results are obtained from plants of trailing growth. The bush variety makes a better garden plant in a small state, but it does not give so good a crop as the trailing variety, and this is important.

With regard to the cooking of both the Custard and the ordinary sort, the fruits are often left too long before they are cut, and this is more important with the Custard than others, as these age quickly. When old they are dry and mealy. The Improved Custard Marrow is

some seasons, but the tubers must be looked over periodically after they are lifted, and diseased specimens be removed or they will be sure to contaminate the whole. No stretch of exaggeration could say that the Potato outlook is promising, but it seems to be in keeping with most other things this year, and being victims of circumstances the limited means at command must be used to prevent the spread of disease. G. H. H.

SOCIETIES.

CROYDON HORTICULTURAL SOCIETY.

THE members of this society were entertained at their rooms, George Street, on Tuesday, the 18th ult., with a highly interesting and instructive paper on "Orchard and Bush Fruit Pests, and How to Destroy Them."

The lecturer was Mr. A. Maalen, Bramley Hill House Gardens, who has on several previous occasions read papers on various subjects at this society's meetings, and he fully maintained his reputation as an exponent of good practical knowledge and advice. In opening his subject he dwelt at some length on the ravages of insect pests, which cause so much worry and anxiety to the gardener and his employer, and the first thing to consider in preventing or eradicating them was to find out which species of the many enemies the attacks were from and so apply the remedies at the proper time. As the old saying is "Prevention is better than cure," so he advised taking the necessary precautions in the late autumn by removing all loose bark on the trees and applying a good insecticide, which would materially benefit the grower in the later seasons when the blossom appears and the hoped-for satisfactory crop of fruit is expected. Another spraying of insecticide should be given before the blossom opens and again after the fruit has set. The use of a fine spray he recommended, as this was conducive to better results than deluging the trees and foliage. He mentioned the number of insecticides on the market, but a few home-made remedies, which he had used with great success, he thought would be more appreciated. Half a pound of emerald green stirred well in 100 gallons of water, adding 1 lb. of lime, is one good remedy. Another is 6 oz. of arsenite of soda dissolved in a little water. Pour this solution into 100 gallons of water, also adding 18 oz. of sugar of lead dissolved in water, and a small portion of soft soap; mix well together during use. This is poisonous, and care should be taken not to leave it carelessly about nor to spray the trees within six weeks of gathering the fruit. A useful wash for winter use is obtained by dissolving separately in water 1 lb. of caustic soda, 1 lb. of crude potash, 1 lb. of soft soap, adding enough water to make 10 gallons of wash; mix well together and apply in the middle of February to the trunks and branches. The varieties of insects he dwelt upon were the winter moth, Apple blossom weevil, codling moth, Apple sawfly, American blight, magpie moth, Gooseberry and Currant sawfly, Currant clear winged moth, and Black Currant gall mite; for the latter, he regretted to say, there was no effectual cure known.

The paper raised a very appreciative discussion by the members, and at its conclusion a hearty vote of thanks was accorded Mr. Maalen.

Several exhibits of flowers were staged, and the thanks of the meeting were given to Messrs. Bunyard, Gregory, and Kromer for bringing them. One new member was elected.

The chairman, Mr. W. J. Simpson, announced the next meeting to take place on September 1, when "Discussions on Floral Decorations with Demonstrations" would constitute the programme.

COMMONS AND FOOTPATHS PRESERVATION SOCIETY.

ENCLOSURE OF STONEHENGE.

THE following letter has been addressed by the Right Hon. G. Shaw Lefevre, chairman of the Commons and Footpaths Preservation Society, to Lord Edmond Fitzmaurice, chairman of the Wilts County Council, with reference to the proceedings proposed to be instituted on behalf of the society to secure a legal decision upon the position of the alleged public rights prejudiced by the enclosure of Stonehenge:—

"August 15th, 1903.

"Dear Fitzmaurice,—I learn from the reports in the local papers that the Wilts County Council, of which you are chairman, at its meeting last week, arrived at two decisions with regard to Stonehenge: (1) It declined to accede to the application of the Commons and Footpaths Preservation Society for a contribution to the costs of legal proceedings, to be undertaken by them for vindicating the right of public access to the monument, by well defined and long used carriage ways, free of charge, and for removing the fences which have been erected across these roads, and which so cruelly disfigure Stonehenge. (2) It agreed to forward to the Government, but apparently without comment or approval as to terms, the offer made to you as chairman of the council, by the owner of the land on which the monument stands, to sell his interest in it and eight acres of land for the sum of £50,000.

"With respect to (1) I may remind you that the application was made by the society many months ago under the impression that there would be difficulty in obtaining either from the County Council or the general public full pecuniary support for the necessary legal proceedings. Later, however, when the County Council, a few weeks ago, decided not itself to undertake these proceedings, on the ground, mainly, that the cost of them ought to be borne by the general public rather than by the District Council, on whom they would fall, if litigation were set in motion by the County Council, the society decided to make an appeal to the public

for the whole of the necessary funds. This appeal met with such general support, testifying the great public interest taken in the question, that the society found themselves in a position to undertake whatever steps are necessary for determining the question of right, and they accordingly instructed their solicitors to commence without further delay (of which there has been too much in the past), the necessary legal proceedings.

"As, however, it is not likely that any material progress will be made in such proceedings until after the long vacation, there will be ample time afforded for negotiation between the Government, yourself, and the landowner concerned, for the transfer of the interest of the latter in the monument. This will be a solution eminently satisfactory to the society, relieving them from an invidious task, provided it is clearly understood, that the fence which so disfigures the monument will be removed, and that the terms of purchase are reasonable.

"The society thinks it necessary to make these reservations, for it has been suggested in some quarters that the fence should be maintained even after purchase of the monument by a public authority. They feel strongly that the existing fence should be removed in any case, whatever other means of protection may hereafter be deemed advisable.

"They are also of opinion, in view of the great importance of the legal issues involved in this case, and the bearing which a decision on them may have on many cases of the same kind in other parts of the country, that unless the terms of purchase are much more reasonable than those now offered, it would be more to the interest of the public that the question of the right of access to the monument should be determined in the first instance.

"Believe me, yours very truly,

"(Signed) G. SHAW LEFEVRE, Chairman.

"The Lord Edmond Fitzmaurice, M.P."

NATIONAL AMATEUR GARDENERS' ASSOCIATION.

CONTRARY to the usual custom the monthly meeting of this association was held on the second Tuesday in the month, and for this reason the president, Mr. T. W. Sanders, F.L.S., took the chair at the meeting held on the 11th inst. at Winchester House, Old Broad Street, London, E.C., at seven o'clock in the evening. Considering the exceedingly heavy rain, the muster was a very satisfactory one. On this occasion Mr. G. M. Grose read a paper entitled "The Influence of Air on the Roots of Plants." Among the practical points touched upon Mr. Grose said he had made many experiments, and the results of his efforts in this direction were given in a simple and concise manner. He spoke of the great advantage of deep culture, as well as of the constant aeration of the surface soil. Regarding the question of plants grown in pots, he referred to the fact that they immediately send their roots to the side of the pots, and not until the roots well fill the pots are flowers of any consequence forthcoming. Mr. Grose gave the result of the following experiment: He planted three Cannas outdoors, 6 feet apart. Around the first he made six holes about 18 inches deep, around the second he bored three holes, and the third plant was left to develop in just an ordinary manner after planting. The holes were immediately filled in with ashes, and the results were as follows: The first plant grew vigorously, and flowered freely for a long time; the second also did well, but not nearly so well as the first plant; and the third plant was more or less a failure. He also spoke of the value of worms in the aeration of the soil, of deep trenching, and the frequent stirring of the soil. Mr. Grose gave his testimony to their advantage. In soils devoid of nitrogen this treatment was invaluable. He also referred to the value of experiments and the careful noting of the results. The paper, though rather shorter than usual, was most interesting, and full of information. The discussion which followed was one of the best which the members have participated in, and was taken up from both scientific and practical aspects. A vote of thanks was accorded the lecturer at the close of a very pleasant evening. The exhibition was held, as usual, in the great hall, and was another of this society's best efforts. Table decorations, by lady members, were admirably shown, Miss Welch, Mr. D. Olliver, and Miss Levi making charming displays. Hardy flowers were superbly exhibited and in pleasing variety. Mr. D. B. Crane was an easy first for six bunches distinct. This exhibit also gained a cultural certificate. Mr. F. M. Vokes, Southampton, was second, and Mr. Levi, Weybridge, third. In a class for a collection of cut flowers there was a remarkable competition, a grand lot of Gloxinias gaining first prize and a certificate for Mr. Bland G. Sinclair, Highgate Road, N.W. A splendid lot of tufted Panseas were shown in this class, as were hardy flowers and Orchids. Taken as a whole the exhibition was a testimony to the cultural skill of the members, and it was easy to see that the different subjects were taken up most enthusiastically. Mr. George Hobday, a Romford amateur, staged Black Hamburgh Grapes, Apples, Tomatoes, as well as vegetables in variety, and each subject in a high state of development.

BRIGHTON HORTICULTURAL SOCIETY.

THE usual summer exhibition of the above society was held on the 25th ult. in the Dome and the Pavilion, and also in the grounds of the Pavilion under a tent, in which the principal plant classes were placed. There was a large increase in the entries and in the number of exhibitors, and a very fine show resulted. The weather was quite fine, though showers threatened, and there was a large attendance. At the luncheon to the judges, presided over by the president, Jeremiah Colman, Esq., a very satisfactory account was given of the progress of the society, there having been a substantial addition to the number of members.

Of plants there were charming groups arranged for effect; Mr. George Miles, nurseryman, Hove, was first with an arrangement of a very artistic character; Lilies were a prominent feature, among them being fine examples of Lillium

auratum rubro-vittatum; Mr. J. Harper, gardener to E. G. Tucker, Esq., Preston Park, was second; he had Lillium Crotone, &c., in good character. In the class for a group of Ferns, Mr. Adams, gardener to Sir G. Shiffner, Bart., Lewes, came first; his arrangement was perfect, especially two cases of finely-coloured Adiantum farleyense; Messrs. W. Miles and Co., nurserymen, Hove, were second.

Tables of foliage and flowering plants, arranged under the Dome, made a very effective feature. Mr. H. Head, Drive Nursery, Hove, came first, and Mr. George Miles was second; both with pretty tables. Begonias, shown in twelves, were fairly good; the best came from Mr. J. Bucknall, gardener to J. Lawson, Esq., Hassocks; the second prize fell to Mr. G. Norman, gardener to P. H. Bayer, Esq., Withdean. Some medium-sized well-coloured Crotons were shown by Messrs. W. Miles and Co., who was placed first; and Mr. H. Garnett, gardener to R. G. Fletcher, Esq., Preston Park, was second. Some bright-coloured Dracenas were shown by Mr. W. E. Anderson, gardener to B. Parish, Esq., Preston. There were some good specimen Palms, and there was a class for a single Palm also, fine examples being staged. Messrs. W. Miles and Co. were first with six good specimen Ferns; Mr. George Stratford, gardener to Dr. Hart, Brighton, was second. One collection of six medium-sized Fuchsias was staged. Zonal Pelargoniums shown in sixes were both well grown and bloomed, and made striking patches of colour. Coleuses were in the form of well-grown and brightly-coloured specimens. There were pretty table plants, and well-coloured Caladiums, though not of large size. The best four pots of Lillium speciosum came from Mr. G. Eastwood, gardener to Mrs. Gould, Hassocks.

Groups of plants were also shown by gentlemen's gardeners and amateurs; the best was set up by Mr. W. E. Anderson. Tables of flowering plants were also shown in this division, and also table plants.

CUT FLOWERS.

At this period of the year these would be plentifully shown. A very interesting class was that for a table of Carnations, the flowers on long stems and arranged with suitable foliaged plants; two very pretty tables appeared: the first prize went to Mrs. Shiffner, Lewes; Mr. H. Elliott, nurseryman, Hurstpierpoint, was second. Roses were little underlined, but fresh and bright; Mr. H. Harris, gardener to E. M. Everard, Esq., was first with twelve blooms, and also with twelve Tea-scented varieties; Mr. J. Davis, gardener to Major Thurlow, Uckfield, was second in both classes. The best twelve spikes of Gladioli were shown by Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, and they had the best twenty-four show Dahlias, showing good blooms for the season; Mr. J. Brown, Worthing, was second; the Crawley firm were also first with twelve very pretty bunches of single Dahlias, which contained two or three new varieties; the best sorts were Aurora, William Parrot, Leslie Seal, Columbine, and Snowdrop; Messrs. Cheal and Sons were also first with twelve excellent bunches of Pompon Dahlias—Cyril, Jessica, Elia, and Darkest of All were perfect. In the twelve bunches of Cactus Dahlias, Messrs. J. Stredwick and Son, Silverhill, St. Leonards, were first with a very fine lot, nearly everyone of which were new varieties.

Certificates of merit were awarded to Ella Krummer, Comet, Osprey, Falcon, Ivanhoe, Florence, George Gordon, and Miss Florence M. Stredwick.

In the amateur's division Mr. P. W. Tulloch, Hove, the secretary of the National Dahlia Society, was first with six excellent bunches; and he also took Messrs. Cheal and Sons' special prize for six vases of Cactus Dahlias, setting up admirable blooms in both cases. Mr. J. Harper had the best six bunches of Pompon Dahlias.

The class for twenty-four bunches of perennials and bulbous plants brought a very fine collection from Mr. J. Davis, who was placed first; Mr. W. Manton, gardener to the Rev. E. Mashtier, Hurstpierpoint, was a good second. Mr. Davis also came first with twelve distinct kinds of annuals; and Mr. F. Bapley, gardener to Miss Visick, Withdean, was second; both being in good form. With six bunches of Sweet Peas Mr. H. Harris was first, and Mr. F. Webster, nurseryman, Tonbridge, second. Asters were fairly good. Some good collections of cut stove and greenhouse plants were shown. The name of the winner of the first prize was not appended. Hardy perennials, in collections of twelve bunches, were very good.

FLORAL DECORATIONS.

The best bridal bouquet, and also that for a ballroom, were staged by Mr. A. W. Trossell, Tonbridge. The best device was a harp in white flowers; and a good wreath took the second prize. There were some very pretty dinner tables. The first prize was awarded to Mrs. G. Lindsay, Hailsham. There were also pretty baskets of cut flowers.

FRUIT.

The display of fruit was extensive and very fine. The best collection of eight dishes was set up by Mr. J. Gore, fruit grower, Polegate. He had Gros Maroc and Muscat of Alexandria Grapes, Dr. Hogg Peach, Milton Nectarine, Figs, Bon Chrétien Pears, very fine Lady Sudeley Apple, &c. Mr. E. Neal, gardener to Mrs. Nix, Tilgate, was a good second. Mr. Gore also had the best collection of three bunches each of three varieties of Grapes, staging in fine character Gros Maroc, Muscat of Alexandria, and Gradenka, a pale amber variety, appearing as if intermediate between Buckland Sweetwater and Foster's Seedling. Mr. W. Taylor, gardener to C. Bayer, Esq., Forest Hill, was a good second. He had Gros Maroc, Chasselas, Napoleon (very good), and Madresfield Court. Mr. J. Seymour, gardener to T. W. Crook, Esq., Worthing, had the best two bunches of Muscat of Alexandria, fine bunches, fairly well coloured; Mr. C. H. Jones, gardener to H. W. Woodley, Wivelsford, was second. Mr. C. Earl, The Gardens, Somershill, Tonbridge, had the best two bunches of Black Hamburgh, finely coloured; and Mr. E. Neal was second. The best two bunches were Muscat of Alexandria from Mr. Neal. Mr. Earl being second with the same sort. The best two dishes of Peaches were Mr. Gladstone and Sea Eagle from Mr. G. Fairs (Messrs. Young and Co.), Hassocks; Mr. Eastwood was second. Mr. Gore had

the best two bunches of Nectarines, having very fine fruit of Milton and Stanwick Elrags, Mr. Fairs coming second with Pine Apple and Spencer. Peaches and Nectarines were also shown in single dishes. The best dish of Pears was Bon Chrétien. Mr. F. W. Thomas, Polegate, had the best four dishes of dessert Apples, viz., Lady Sadeley, Beauty of Bath, Worcester Pearmain, and Kerry Pippin. Mr. A. H. Parsons, Lewes, was second; his best two dishes were White Melrose and Irish Peach. Lady Sadeley was the best single dish. Calinary Apples were very good, the best among them being Peasegood's, Lord Salford, Ecklinville, and the Queen. The best single dish was Ecklinville. Plums were good. Mr. J. Redman, Lewes, had the best four dishes in Diamond, Washington, Victoria, and Purple Gage.

Vegetables filled a large room. There were many collections competing in various classes. Potatoes in collections of six dishes were a fine feature.

There were several very fine miscellaneous exhibits, among them a magnificent collection of foliage and flowering plants, arranged with great skill and taste, from Messrs. Balchin and Sons, nurserymen, Brighton and Hassocks, who also had a representative collection of shrubs; Mr. T. S. Ware, Limited, Feltham, had a large bank of hardy flowers; Messrs. J. Cheal and Sons, Crawley, filled a large table with fruit trees, various plants, cut flowers, &c.; Messrs. J. Peed and Sons, nurserymen, West Norwood, had fine plants, cut flowers, &c.; Mr. G. W. Piper, Uckfield, charming Roses; and Mrs. Banger, alpine, &c.

A COTTAGE SHOW.

LADYWELL, LEWISHAM, AND DISTRICT COTTAGERS' HORTICULTURAL SOCIETY.

The twenty-second annual exhibition of this society was held in the grounds of Riverdale on the 19th and 20th ult., and, though the weather was unfavourable, it proved a great success and attracted a large number of visitors. At the opening ceremony, the president (Mr. H. J. Jones) explained that the society originated through some dispute as to who could grow the best Vegetable Marrows, the result being a competition, which attracted so much interest that the following year it was continued and other vegetables added to the list for competition. Eventually flowers and plants were also added. The society has continued to prosper until now it has become one of the most important of the suburban societies. The most important work of the society is that the allotment ground, which consists of some 160 plots, is under the control of the committee, and the vegetables grown by the cottagers would compare favourably with those grown by more experienced cultivators and under more favourable conditions. One of the rules is that a member holding a plot is liable to have it taken away at a week's notice if it is not properly cultivated, but it is rarely that this rule has to be enforced. All vie with each other in trying to secure the prizes offered annually for the best kept gardens, and also for the prizes offered for flowers and vegetables at the show, the number of entries for which were upwards of 600. The vegetable classes are, perhaps, the most interesting. In the flower tent some capital groups were set up. Messrs. J. Laing and Sons contributed a fine group of Begonias, also a collection of herbaceous plants. Mr. H. J. Jones had a miscellaneous group, in which Cannas, Begonias, and Celosias were arranged among Palms, Bamboos, Eulalias, and other light-follied plants.

SANDY HORTICULTURAL SOCIETY.

FOR thirty-five consecutive years a flower show has been held at Sandy, and for a considerable portion of the time on the last Thursday in August, and in the grounds of Sandy Place, which is very near the railway station. The show comprises almost every feature that can interest country people: plants, flowers, fruits and vegetables; farm produce, including cereals; market garden produce, for Sandy is the centre of a huge market gardening industry; needlework, knitting, dressed dolls, machine and hand work; stuffed animals, photography, honey, butter, eggs, trussed fowls, &c., in all some 255 classes; in addition, dogs, rabbits, cage birds, and pigeons are extensively shown, a large number of tents being required, and quite an army of judges. The society has a remarkable organisation; it has a good working committee of thirty-three members, in addition to the officers, and in all the leading villages in Bedfordshire and the adjacent counties there is a district committee looking after subscriptions and exhibitors, and organising travelling conveniences. Sandy is generally favoured with fine weather, and there was an enormous attendance, excursion trains coming from all parts.

PLANTS.

Sandy must have fine specimen plants, and offers a first prize of ten pounds. This draws Mr. Jas. Cypher, of Cheltenham, to the Bedfordshire village, and on this occasion he took the first prize with fine examples of Bougainvillea Cypheri, glabra, and andersonia, Statice intermedia, and profusa, Erica eweriana and marnockiana, Ixora macrostylis (Duffill), Stephanotis floribunda, and Alamanda nobilis. Mr. W. Vause, nurseryman, Leamington, came second; he had fine examples of Erica acroniata, E. emula and E. exquibite, Erica Pilgrimii, Alamanda nobilis, A. Hendersoni, &c. Mr. W. Finch, nurseryman, Coventry, was third; so Sandy can attract our three leading exhibitors of specimen plants. It is something for a country horticultural society to offer £30 in prizes in this one class. In the class for a group, two pretty ones were arranged: Mr. W. Finch was first and Mr. Vause second. Some pretty table plants were also staged.

In the amateur's division for six foliage plants, Mrs. Astall, Woodbury Hall, Sandy, was first with well developed subjects, and Mr. Humphreys, gardener to Sir A. W. Marshall, Buckland Tower, was second. The best six Fuchsias came from Mr. E. Leeds-Smith, Sandy. Stove and greenhouse plants were also shown in sixes; also Coleus, hardy Ferns, Balsams, Cockscumbs, always very fine, specimen plants in several classes, and zonal Ivy-leaved

and tricolor Pelargoniums. It was pleasant to see that Sandy encourages the last-named handsome leaved plants, and they were remarkably well grown. Very creditable window plants were also shown by cottagers.

The leading feature of the Sandy show is the cut flower classes; one very large tent and a portion of another were required to give accommodation to these classes. With twenty-four Roses, Messrs. G. and W. Barch, nurseryman, Peterborough, were placed first with some excellent blooms; the deep coloured Hybrid Perpetuals were particularly fine, Horace Verney in particular being in its best character; the leading blooms were Caroline Testout, Killarney, Duke of Teck, Beesde Brown, Mme. Eugene Verdier, Frau Karl Druschki, Mrs. J. Laing, Marie Baumann, Star of Waltham, Comte Raimbault, Dr. Andry, Mrs. E. Mawley, and Xavier Olibo, a fine lot of flowers for this late period of the year. Messrs. E. Harkness and Co., Hitchin, were second also with good blooms, chief among them being Her Majesty, Marchioness of Londonderry, Tom Wood, F. Karl Druschki, Niphetos, Horace Verney, Comte Raimbault, Mme. Wagram, &c.; Messrs. Harkness and Son, Bedale, were third. With eighteen Tea-scented, Messrs. Harkness and Co., Hitchin, were first; they had in good character Rubens, Mme. Wagram, Mrs. E. Mawley, Ernest Metz, Jean Ducher, Marie van Houtte, Souvenir de S. A. Prince, White Maman Cochet, &c.; Messrs. Harkness and Son, Bedale, were second. Messrs. Harkness and Co., Hitchin, were first with twenty-four spikes of Gladioli; and Mr. C. Bright, Cambridge, was second, both showing in admirable character.

Dahlias are always a strong feature at Sandy. With thirty-six blooms of show varieties Mr. S. Mortimer, Swiss Nursery, Farnham, was first, and Messrs. Keynes and Co., nurserymen, Salisbury, were second. With twenty-four varieties Mr. G. Humphries, florist, Chippenham, was first, and Mr. J. R. Tranter, Henley-on-Thames, second. With twenty-four blooms of Cactus Dahlias, shown on boards, Messrs. Keynes and Co. were first. There were excellent examples of Maid of Honour, Imperator, Ajax, Mary Farnworth, J. W. Wilkinson, Albion, Etina, J. H. Jackson, Clarence Webb, Princess, Mrs. H. J. Jones, Mrs. J. J. Crowe, &c. Mr. S. Mortimer was second, and Mr. G. Humphries third. Cactus Dahlias in twelve bunches, six blooms in each bunch, made a most attractive display. Messrs. Keynes and Co. were first with very fine blooms of Reliance, Sceptre, and Pink Pearl (three new varieties), also Winsome, Mabel Tulloch, J. W. Wilkinson, Etina, &c. Mr. S. Mortimer was a close second. He had in fine character Gabriel, Lyric, Brilliant (new), Mrs. E. Mawley, Brightness, &c. With twelve bunches of Pompon Dahlias Mr. H. Brown, Luton, came first, and Messrs. Keynes and Co. were second.

The class for twenty-four bunches of hardy herbaceous and bulbous flowers brought a splendid collection from Messrs. Laxton Brothers, Bedford, who had Lilliums, Phloxes, Helianthus, Pyrethrum, Gladioli, Scabiosa caucasica (very fine), &c.; Messrs. Harkness and Co., Hitchin, were second; and Mr. A. R. Searle, Castle Ashby, third. Sweet Peas were also numerous shown in bunches.

In the amateurs' division there were classes for Dahlias, Roses, Gladioli, Marigolds, &c., and they were all well filled.

Fruit was well represented also. Mr. J. Barson, the Gardens, Hitchinbrook, Huntingdon, was placed first with eight dishes. He had Alicante and Muscat of Alexandria Grapes, Peaches and Nectarines (both very fine), Figs, Melons, &c.; Mr. H. Folkes, the Gardens, Gaddesden, was a good second. Mr. A. R. Searle, Castle Ashby, had the best six dishes, and Mr. T. Lockie, the Gardens, Diddington Hall, was second. Mr. W. C. Medral, the Gardens, Old Warden Park, was first with two bunches of Black Hamburg Grapes. Mr. C. J. Gribble, Biggleswade, had the best two bunches of Alicante. Mr. Barson came first with Muscat of Alexandria. Peaches, Nectarines, Melons, Figs, and Plums were well shown; red Plums were more numerous than the pale ones; culinary and dessert Apples were somewhat poor.

Vegetables were finely shown in competition for the special prizes offered by Messrs. Sutton and Sons, E. Webb and Sons, and others, but the crowded state of the tents prevented any particulars being gathered. There were some pretty table decorations, &c.

Large silver-gilt medals were awarded to Messrs. Dobbie and Co., Rothsay, for Dahlias, Roses, Pentstemons, &c., a very fine display, and a certificate of merit was awarded to fancy Dahlia William Sheldon; to Messrs. Hobbles and Co. (John Green), Dereham, for a most elaborate display of Dahlias, Roses, &c., and they were awarded certificates of merit for climbing Rose Dorothy Perkins, and for two charming Cactus Dahlias, viz., Effective and Dainty; and to Mr. W. B. Child, nurseryman, Acoc's Green, for cut flowers. Silver medals were awarded to Mr. F. M. Bradley, Peterborough, for Carnations, &c., and to Messrs. W. and J. Brown, Stamford, for plants and cut flowers. A certificate of merit was also awarded to Dahlia (show) Rothsay, from Mr. S. Mortimer. A collection of cut flowers, Clematis, &c., was also staged by Messrs. Wood and Ingram, nurserymen, Huntingdon.

ROYAL HORTICULTURAL SOCIETY.

ON Tuesday last the Drill Hall was almost filled with Dahlias, the occasion being the National Dahlia Society's annual show. Very little fruit, few Orchids, or other plants were exhibited.

ORCHID COMMITTEE.

Present: Messrs. Harry J. Veitch (chairman), James O'Brien, W. H. White, W. Boxall, J. Wilson Potter, E. Hill, J. W. Odell, F. Sander, Walter Cobb, and de B. Crawshaw.

Messrs. Charlesworth and Co., Heaton, Bradford, Yorks, showed some handsome Orchids—for instance, Cattleya Lord Rothschild (C. gaskelliana x C. aurea), C. Germania (C. schofieldiana x hardyana), C. Mrs. Pitt (C. Harrisoni x C. aurea), Brasso-Cattleya gigas-digbyana, Cattleya suavis superba (C. intermedia x Mendellii), Sophro-Lelia Gratrix magnifica, Cypripedium Mme. G. Truffaut (C. Stonei x C. ciliolare), and others.

Messrs. B. S. Williams and Son, Holloway, N., showed a small group of Orchids that contained several Cypripediums, Cologynema massangeana, Vanda tricolor The Glen var., and Cattleya crispata.

Messrs. Sander and Sons, St. Albans, exhibited several hybrid Orchids, notably Lallo-Cattleya blancheyensis (L. tenebrosa x C. gigas), L.-C. Martinetti (C. Mossie x L. tenebrosa), Cypripedium Transvaal (C. chamberlainianum x C. rothschildianum), Phalaenopsis Esmeralda, &c.

NEW ORCHIDS.

A first-class certificate was awarded to Cattleya X pittiana Wilson Potter's variety. — A large flower, with rosy buff drooping sepals and petals and broad handsome purple lip, fringed with white. The upper part of the lip is suffused with red-brown. Cattleya aurea and C. granulosa schofieldiana are the parents. Shown by J. Wilson Potter, Esq., Elmwood, Croydon (gardener, Mr. W. H. Young).

Awards of merit were given to Cattleya Esquiritia.—C. Holfordii x C. Parthenia var. Prince of Wales are the parents of this new Cattleya. The flowers are small, with white sepals and petals, and purple-tipped lip with yellow throat. Altogether a dainty flower. From Messrs. Sander and Sons, St. Albans.

Cattleya Tankerville.—A hybrid between Cattleya bicolor and Cattleya Rex. The sepals and petals are buff-coloured towards the margins, paling towards the centre. The lip is rich purple, and shows remarkably well against the light sepals and petals. From Messrs. Stanley, Ashton, and Co., Southgate, N.

FRUIT COMMITTEE.

Present: Messrs. George Bunyard (chairman), H. Balderston, Henry Esling, Owen Thomas, F. L. Lane, G. Reynolds, J. Willard, Horace J. Wright, James Gibson, Alex. Dean, William Fyfe, George Kell, John Jacques, H. Markham, W. Poupert, S. Mortimer, J. Cheal, and the Rev. W. Wilks.

There were several new Melons, a new Grape, a new Tomato, a new Apple, and a new Marrow before the fruit committee, but no awards were made.

Lady Plowden, Aston Rowant House, Oxon (gardener, Mr. Clarke), showed a collection of fruit that comprised very good Humboldt, Pine-apple, Newton, Lord Napier, and Stanwick Elrags Nectarines, Dymond Peach, Reine Claude de Bayay Plum, and Citrons. Silver Banksian medal.

FLORAL COMMITTEE.

Present: Mr. H. B. May (chairman), Messrs. W. Marshall, Richard Dean, C. T. Drury, J. F. McLeod, W. Howe, G. Reuthe, W. Bain, H. Turner, C. E. Pearson, C. Jefferies, B. Wallace, R. C. Notcutt, E. H. Jenkins, W. J. James, G. Paul, J. Walker, J. Fraser, E. T. Cook, J. Hudson, and the Rev. F. Page Roberts.

There is little doubt that the new Vines from Central China, exhibited by Messrs. Veitch and Co., Chelsea, on Tuesday last, were the most interesting new plants on this occasion. There were some seven species, all distinct, and good serviceable garden plants. The names are Vitis megaphylla, with bipinnate leaves 15 inches long and 12 inches wide at base, slightly glaucous beneath, and the rachis red. V. Thomsoni has five-lobed leaves, reddish above and purple-violet beneath. A neat and attractive plant, and one that clings well. V. acutifolia is almost self-descriptive, the five-parted leaves are distinctly and deeply notched. V. armata is a broad-leaved plant, with entire ovate leaves, the leaf-stalks and stems of which are thickly studded with spines. V. sinensis is a near approach to V. Colnetiae, with broad, ovate, entire, as well as five-lobed leaves often on the same plant. V. flexuosa Wilsoni is a small glossy-leaved species, the leaves ovate-acuminate, dark green, and reddish below; most attractive. V. Romaneti is a broad-leaved species after V. sinensis, and promises to be valuable for pergolas and the like. Buddleia variabilis var. vetchiana was also well shown by Messrs. Veitch, and a small group of Calceolaria Burbridgei was also shown by this firm.

Messrs. W. Wells and Co., Limited, Redhill, set up their first display of early Chrysanthemums, of which Carrie, a rich gold; The Champion, gold, with broad forets; Gertie, salmon-buff, with deeper centre; Champ de Neige, pure white; Orange, reddish chestnut; and Pearlie, rosy lilac, were the best.

Messrs. Hobbles and Co., Dereham, showed Fuchsia President Gosell, a plant almost midway between F. fulgens and F. corymbiflora, and with very ample foliage; also Fuchsia H. Henkel, a variety with dark leafage and pendent coral-red flowers.

Mr. George Paul showed a fine spike of Gladiolus Princess, very vivid in colour and wide-expanding flowers. Mr. R. C. Notcutt, Woodbridge, Suffolk, showed good panicles of Phlox Lady Kinloch, a variety with salmony pink flowers; and Mr. Young, Southend, Essex, had plants of Pelargonium Southend Gem, a sport from Raspaal that in some respects is like West Brighton Gem. It is semi-double and free-flowering.

Messrs. T. S. Ware, Limited, Feltham, showed Lobelia Feltham Beauty, a scarlet and white form of L. cardinalis. The same firm also exhibited Lillium auratum Fashiori, a widely-expanded form.

Gladiolus Mrs. V. Lennell, a form of G. nanceus, with bluish-white petals and a rich crimson blotch on the lower petal, was shown by W. C. Bull, Esq., Ellington Road, Ramsgate. It is very showy, and a good spike would be most effective.

Sir Trevor Lawrence, Bart., Dorking, also showed Gladioli, chiefly, however, of the purplish and violet shades. Messrs. Jones and Sons, Shrewsbury, had a large vase of Carnation Noni, a salmon-red variety, with a good clove perfume, and the flowers on strong stems.

Messrs. R. Wallace and Co., Colchester, showed Gladiolus Baron J. Hulot, deep violet-purple; G. Mephistopheles, scarlet and yellow, with crimson flakes, and G. Van Dael, a lovely rose-salmon, with an enormous spike of handsome flowers. This last is certainly one of the finest we have seen this season.

NEW PLANTS.

Vitis Thomsoni.—A remarkable and attractive species. The leaves are five-lobed, of a reddish shade on the upper surface, and a distinct violet-purple on the reverse side. They are supported on short stalks about 5 inches long. By means of tendrils the stems and branches readily obtain support. From every point of view this is a valuable climber. First-class certificate.

V. armata.—This is as vigorous in growth as *V. Colnagtie*, and has broadly ovate entire leaves, the petioles and main stems being abundantly studded with clearly erect spines. A handsome and showy species. Award of merit.

V. megaphylla.—A species with more or less bipinnate leaves, the lobes, as also the divisions, widely separated. The leaves when fully developed are 15 inches long and 12 inches broad. At the base the rachis is pale red, the leaves dark green above and glaucous beneath. Award of merit.

V. flexuosa Wilsoni.—This species should be admirably suited to small gardens by reason of its neat habit of growth. The dark glossy green leaves are about 2 inches across, ovate acuminate, crenate, with a reddish tinge on the under surface. It is a good and compact grower, and one of the most beautiful of the set. Award of merit.

V. sinensis.—This vine has the peculiarity of producing simple cordate leaves and three or five parted leaves on the same plant. Thus it will be seen to be a variable species, yet not the less beautiful on this account. It is tall and vigorous, abundantly furnished with foliage. Award of merit.

All of the above were shown by Messrs. Veitch and Sons, Limited, Chelsea. The plants, together with others mentioned in our general report, were collected in Central China by Mr. Wilson, and certainly constitute an admirable series of these good climbing plants.

Chrysanthemum The Champion.—An early-flowering variety and quite distinct in the broad florets that slightly incurve at the ends. The colour is a deep rich gold. From Messrs. W. Wells and Co., Limited, Redhill. Award of merit.

Chrysanthemum maximum King Edward.—A very large pure white broad-petalled variety, possibly the largest of the many now in commerce. From Mr. W. Angus, Penicuik, N.B. Award of merit.

Tamarix hispida aestivalis.—A pleasing variety with erect graceful inflorescences of a red-pink hue. From Messrs. Robert Veitch and Son, Exeter. Award of merit.

Hidalgoa Wercklei.—A beautiful gathering of flowers of this capital climbing plant was shown, the brilliant orange-vermilion colour being most effective. It was also interesting to learn that the flowers had been cut from a plant growing in the open. Shown by Sir Trevor Lawrence, Bart., Burford, Dorset (gardener, Mr. W. Bain). Award of merit.

Gladiolus Van Dael (Gandavensis).—The spikes shown were handsome and well filled with beautiful flowers of a pretty shade of soft salmon with delicate rose-pink shading. The spikes, we were informed, were merely taken from the beds in the ordinary way, and with no preparation for the exhibition table. From Messrs. R. W. Wallace and Co., Colchester. Award of merit.

NATIONAL DAHLIA SOCIETY.

ON Tuesday last this society held its annual exhibition in the Drill Hall, Westminster, kindly lent by the Royal Horticultural Society for the occasion. The display made by the Dahlias was particularly bright and attractive; in fact, the show was considered to be one of the best ever held by the National Dahlia Society. Cactus varieties were strongly represented, and Pompon and single varieties were also well shown. The classes devoted to the large show blooms made a brilliant display in themselves. Several new Cactus and Pompons and one single were certificated, but no show varieties gained awards. The non-competitive exhibits of Dahlias by nurserymen added much to the interest of the exhibition. There was quite a large gathering of Dahlia enthusiasts from all parts of the country, among them Mr. E. Mawley, president of the society. Thanks to the efforts of the honorary secretary, Mr. P. W. Tulloch, who was assisted by Mr. F. J. Hudson, judges and exhibitors found that admirable arrangements had been made.

NURSERYMEN—SHOW AND FANCY DAHLIAS.

Forty-eight blooms, distinct: First, Messrs. Keynes, Williams and Co., Salisbury, with a bright display of medium-sized blooms of excellent form. Among the best were Richard Dean, maroon; Dr. Keynes, orange-buff; John Hickling, rich yellow; Henry Bond, rich rose-lilac; Warrior, glowing red; John Walker, white; Mr. Charles Turner, Royal Nurseries, Slough, was a good second—the blooms were of very good form and of brilliant colours; Mr. S. Mortimer, Farnham, was third.

Thirty-six blooms, distinct: First, Mr. William Treseder, Cardiff. Some fine blooms were included in this stand, notably John Walker, white; Mr. Saunders, rich yellow and white; Mrs. David Saunders, rose-purple; Mrs. G. E. Gifford, yellow; Duke of Fife, dark red; and Mrs. Gladstone, pink and white. Mr. S. Mortimer, Farnham, Surrey, was second; the colours in his exhibit were most distinct and good, but the blooms lacked the splendid form of the first prize lot. Mr. John Walker, Thame, Oxon, was third.

Twenty-four blooms, distinct: First, Mr. M. V. Seale, Sevenoaks, with handsome well-formed flowers. S. Mortimer, purple; Crimson King; William Powell, yellow; and Peacock, dark crimson, with white tipped petals, were of the best. Messrs. J. Cray and Sons, The Nurseries, Frome, were second with very bright, good blooms, and Mr. George Humphries, Kingston Langley, third.

Eighteen blooms, distinct: First, Mr. George Humphries, The Nurseries, Kingston Langley, Wilts. Arthur Rawlings, dark red; James Cocker, purple-crimson; Mrs. Gladstone, pink; and R. T. Rawlings, rich yellow, were the best of a good lot. Messrs. J. Cray and Sons, The Nurseries, Frome, were a good second, although one or two of their blooms lacked size; Mr. M. V. Seale, Vine Nurseries, Sevenoaks, was third.

Twelve blooms: First, Mr. J. E. Tranter, Hart Street, Henley-on-Thames, with some good blooms; second, Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley.

CACTUS DAHLIAS.

Eighteen varieties (in bunches): First, Messrs. J. Stredwick and Son, St. Leonards, with a very handsome exhibit. The pinks were especially good, for instance, Mrs. J. W. Wilkinson, Pearl, Diadem, Rainbow, Comet, and Ella Kraemer; Ivanhoe, old gold; Mrs. Winstanley, bright red; Oliver Twist, red; and Florence Stredwick were distinct and good. Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, were second. Mrs. Edward Mawley, yellow; Albatross, white; and J. H. Jackson, maroon, were very good in a collection of somewhat small blooms. Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, were third.

Twelve varieties, in bunches: First, Mr. John Walker, Thame, Oxon, with Mrs. Mawley, Eva, Crimson Gem, and Raymond Parkes as the best blooms. Mr. S. Mortimer was a very good second with finely-formed flowers. Queen Alexandra, rose buff, a new seedling, was noticeable. Mr. Charles Turner, Slough, was third.

Forty-eight blooms, distinct: First, Messrs. J. Burrell and Co., Cambridge, with a very bright display. There were some splendidly coloured flowers among them, and we may mention Roaine, rich rose; Gilbert, yellow; Maurice, rich crimson-purple; Blanche, white; Phineas, bright red; Olga, rich rose-lilac; Ida, pale yellow; H. Jackson, maroon. Of the varieties shown by Mr. Burrell forty of them were of his own raising. Messrs. Keynes, Williams and Co. were second, and their stand contained many good blooms. Messrs. J. Stredwick and Son were third.

Twenty-four varieties, distinct: First, Mr. W. Baxter, The Nurseries, Woking, with some bright and large blooms. A really good lot. Mr. S. Mortimer, Farnham, Surrey, was second, and his exhibit included some splendid blooms; third, Mr. W. Treseder, Cardiff.

Twelve varieties in vases: First, Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, who exhibited a meritorious display. Perhaps the best vaseful was Mrs. de Luca, rich yellow, the outer petals pale bronze. Mr. M. V. Seale, Sevenoaks, was second, and Messrs. Keynes, Williams and Co. third.

POMPON DAHLIAS.

Twenty-four varieties in bunches: First, Mr. Charles Turner, Slough, with a lovely lot. Mr. Turner grows and shows these pretty flowers most successfully, invariably coming out best for Pompons. Mignon, deep purple; Bacchus, bright red; Emily Hopper, yellow; San Toy, white, edged purple; and Cyril, dark red, were among the best. Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, were second with a very attractive collection; and Mr. M. V. Seale, Sevenoaks, was third.

Twelve varieties in bunches: First, Messrs. J. Cray and Sons, Frome, with Frome, Bacchus, red; Nerissa, rose-pink; Emily Hopper, yellow; E. Harper, red; and Nellie Broomhead, rich lilac, were best. Mr. John Walker, Thame, Oxon, was a good second, and Mr. George Humphries, Kingston Langley, third.

SINGLE DAHLIAS.

Twenty-four varieties: First, Messrs. J. Cheal and Sons, Crawley, with a beautiful display. There were some lovely things among them, for example, Eric, gold and pale purple; Miss Roberts, yellow; Serita, rich crimson; Snowdrop, white, yellow centre; Formosa, scarlet; Beauty's Eye, lilac-pink; Vesuvius, bright scarlet. Mr. M. V. Seale was second.

Twelve varieties: First, Mr. John Walker, Thame, with some good flowers. Miss Roberts and Beauty's Eye were of the best. Messrs. J. Cray and Sons, Frome, were second, and Mr. G. Humphries, Kingston Langley, third.

DECORATIVE CLASSES.

Shower bouquet of Cactus Dahlias: First, Mr. W. Treseder, Cardiff; second, Mr. Seale, Sevenoaks; third, Mr. Kimberley, Queen's Road Nursery, Kenilworth.

Vase of Pompon Dahlias: First, Mr. W. C. Pagram, Weybridge; second, Mr. M. V. Seale; third, Mr. Kimberley, Kenilworth.

Fancy single Dahlias, six blooms: First, Mr. J. F. Hudson, Gunnersbury House; second, Mr. John Walker, Thame; third, Mr. M. V. Seale, Sevenoaks.

AMATEURS' DIVISION.—SHOW AND FANCY DAHLIAS.

A considerable bulk of the membership of the National Dahlia Society is made up of amateurs, who grow plants in number according to their convenience for cultivation. They grow only the show varieties, caring little or nothing for the Cactus, Pompon, and single types. This class plants yearly a large number of Dahlias, and to them the show type represents the ideal of form and beauty. Readers of THE GARDEN would be greatly astonished could they realise anything like the quantities of cuttings and plants of show Dahlias annually distributed.

With twenty-four blooms, Mr. Thomas Anstias, Brill, Bucks, an old Dahlia grower, won the first prize in cash and a silver challenge cup. His leading blooms were William Powell, John Hickling, Duchess of Albany, John Walker, Dr. Keynes, Marjorie, R. T. Rawlings, Mrs. Gladstone, Mrs. Langtry, J. T. West, and Mrs. W. Slack. Mr. J. Pilling, Ges Cross, Hyde, was second with somewhat similar varieties; and Mr. W. Peters third.

With eighteen blooms, Mr. A. Parker, Ivy Hatch, Sevenoaks, was first, having as his leading flowers Duke of Fife, Dandy, Duchess of York, Mrs. Gladstone, Henry Eckford, Dr. Keynes, Florence Tranter, and Matthew Campbell. Mr. S. Cooper, Hamlet, Chippenham, took the second prize; and Mr. E. T. Matthews, Derby, the third.

With twelve blooms from which fancy varieties were excluded, Mr. John Newman, Bell Inn, Kingswood, Bristol, was placed first with some excellent flowers, chief among them being Mr. Glascock, Marjorie, R. T. Rawlings, Dr. Keynes, Duchess of York, Florence Tranter, the Rev. George Rawlings, and Richard Dean; Mr. J. Cousins, Greenway Lane, Cheltenham, was second.

With six varieties, a class in which there were several competitors, Mr. G. Hood, Langley Burrell, Cheltenham,

took the first prize. He had in excellent character Arthur Rawlings, John Walker, Ethel Britton, R. T. Rawlings, Shotesham Hero, and Mrs. Gladstone. Mr. F. Grinstead, Beaufort Park, Battle, came second, also with some good blooms; and Mr. J. Britton was third.

With twelve fancy Dahlias, Mr. S. Cooper came first. He had in tipped and striped flowers Rev. J. B. M. Camm, Mrs. Saunders, Dandy, Hercules, Sunset, Matthew Campbell, Watchman, &c.; Mr. Thomas A. Antles was a good second. With six fancies, Mr. J. Newman came to the fore. He had in good character Mrs. Saunders, Gaiety, Matthew Campbell, Hero, and two others; Mr. J. Cousins was second, and Mr. A. Parker third.

CACTUS DAHLIAS.

Next came a class for six bunches of Cactus varieties, six blooms in a bunch, shown in vases with appropriate foliage. There appeared to be but one exhibitor, the first prize going to Mr. E. Turner, Hippington, Sevenoaks, the varieties unnamed.

With nine bunches, three blooms in a bunch, Mr. P. W. Tulloch, Hove, the honorary secretary of the society, was well ahead with fine blooms of Mrs. H. J. Jones, J. H. Jackson, Mrs. E. Mawley (awarded a silver medal for the best bunch in this division); P. W. Tulloch, Florence, Miss F. M. Stredwick, a fine new white; H. T. Robertson, Mrs. Winstanley, Lucifer, a bright coloured flower, &c.; Mr. W. Peters was second; and Mr. G. Quinlan third.

With six vases, Mr. H. Brown, Luton, came first; he had good bunches of Ajax, J. W. Wilkinson, Lord Roberts, J. H. Jackson, Mrs. E. Mawley, and Up-to-date; Mr. F. Grinstead took the second prize.

The best twenty-four blooms of Cactus shown on boards were set up by Mr. H. A. Needa, Horsell, Woking. He had in fine character Alpha, Mrs. E. Mawley, Florida, Clara G. Stredwick, Uncle Tom, Lady Collin Campbell, J. W. Fife, Mabel Tulloch, Gaillard, Mrs. Clifton, Winnifred, Richard Dean, Ringdove, Lyric, &c. Mr. J. Bryant, St. Martin's Terrace, Salisbury, was second, also with excellent blooms; and Mr. J. Shoebridge, St. Margaret's, East Grinstead, was third.

With twelve blooms, Mr. H. Brown was again to the fore. He had in very good character Ajax, Charles Woolbridge, Mrs. E. Mawley, J. W. Wilkinson, Lord Roberts, Roaine, Exquisite, and Mrs. Carter Page. Mr. E. T. Matthews, 42, Almond Street, Derby, was second, and Mr. G. Quinlan third.

With six blooms there was, as in the former class, a keen competition. Mr. N. Lockyer, Greenhill Park, New Barnet, taking the first prize with capital examples of Alpha, Vesta, Mrs. H. J. Jones, Lord Roberts, Starfish, and Britannia.

POMPON DAHLIAS.

With twelve varieties in bunches of six blooms, Mr. H. Brown was first with charming blooms of Emily Hopper, Dr. Jim, Rosebud, Nerissa, Hypatia, and Distinction; Mr. J. F. Hudson, Gunnersbury House, Acton, came second; and Mr. W. C. Pagram, The Whin Gardens, Surbiton, third.

With six varieties Mr. A. Brown, of Luton, came first. His best blooms were Lorna Doone, Buttercup, Nerissa, and Bacchus. Mr. T. Grazeley, North Street, Luton, was second, and Mr. J. Britton, Brentwood, third.

SINGLE DAHLIAS.

With six varieties in bunches of ten blooms Mr. J. F. Hudson came first with Lealie Seale, William Farrot, Columbine, Polly Eccles, Eric, and one other. Mr. E. Mawley, the president of the society, Rosebank, Berkhamsstead, came second with good bunches of Victoria, Polly Eccles, Tommy, Aurora, &c.; Mr. W. Peters was third.

With six bunches, six blooms in each, the Rev. S. Spence Pearce, Woodstock, Oxon, was first. He had very good Beauty's Eye, Victoria, Columbine, and Polly Eccles.

With twelve varieties, three blooms of each, arranged for effect with foliage, Mr. E. Mawley was first and Mr. J. F. Hudson second, but this class was not a success from an artistic point of view.

DECORATIVE CLASSES.

The best basket of Dahlia blooms, arranged with any kind of foliage, came from Mr. H. A. Needa. He had pale coloured Cactus varieties, with bronzy and green foliage, an excellent piece of work. Mr. Richard Edwards, Sevenoaks, came second, also with a pretty basket of Cactus Dahlias, similarly arranged.

Mr. Needa also had the best vase of twelve Dahlia blooms, similarly arranged with foliage. He had a mixture of scarlet and crimson Cactus Dahlias, with bronze and variegated foliage. Mr. P. W. Tulloch was second; he had deep orange Cactus with bronze and green foliage. Mr. F. G. Oliver, Tollington Park, was third.

The best three vases of blooms of Cactus Dahlias, also arranged with foliage, were from Mr. Tulloch, who had in good character Mrs. E. Mawley, Lucifer, and Mrs. Carter Page. Mr. E. Mawley was second, also with good blooms, and Mr. R. Edwards third.

Next came three classes for those who had never won a prize at a show of the society. With six blooms of show and fancy varieties Mr. J. Newman, Kingswood, Bristol, was first.

NEW DAHLIAS.

First-class certificates were given to POMPON VARIETIES.—Edna, yellow, with faint bronze margin, and Queen of Whites, both from Mr. Charles Turner, Slough.

CACTUS VARIETIES.—H. W. Sillem, large, crimson-red, from Mr. H. Shoemith, Westfield, Woking; Sirius, splashed red and gold; Mrs. H. L. Brownson, fawn colour; Pearl, rich pink; Florence M. Stredwick, white, splendid form; and Mrs. J. W. Wilkinson, deep rose; all from Messrs. J. Stredwick and Son, Silverhill Park, St. Leonards.

SINGLE.—Princess of Wales, rose-pink. From Messrs. J. Cheal and Sons, Crawley.

Mr. C. G. Wyatt gave a lecture on "Judging Cactus Dahlias."

* Reports of the Dublin, Dumfries, and Stroud Flower Shows are unavoidably held over.

A Bank Manager
and
DR. TIBBLES' Vi-Cocoon

MR. WILLIAM STORES
CAPTAIN, Commander, and
Agent, 11, Whitehall, writes:—
"I am pleased
to add my testimony in
behalf of Dr. Tibbles' Vi-
Cocoon."
"My health is 100 quite
back down, being six months
as bed, compelling me after
eighty-four years, thanks to
remedy, Bank Managership
on the 15th of year."
"I take a 1s. 6d. tin every
week, and my health has been
far better through taking the
Vi-Cocoon than at any previous
time."

Safe, Quick, Lasting, Effectual, Economical, and Unsurpassed for Producing Fruits, Flowers, and Vegetables in the Highest Degree of Perfection.

Sold Everywhere in 6d. and 1/- Tins; and Sealed Bags, 7lb., 2/6; 14lb., 4/6; 28lb., 7/6; 56lb., 12/6; 112lb., 20/-; or direct from the Works, Carriage Paid in the United Kingdom for cash with order (except 6d. Tins).

Every Tin, Bag, and Seal bears the Trade Mark, the only Guarantee of Genuineness.

ANSWERS TO CORRESPONDENTS.

RULES FOR CORRESPONDENTS.

Questions and Answers.—The Editor intends to make THE GARDEN helpful to all readers who desire assistance no matter what the branch of gardening may be, and with that object will make a special feature of the "Answers to Correspondents" column. All communications should be clearly and concisely written on one side of the paper only, and addressed to the EDITOR OF THE GARDEN, 90, Tavistock Street, Covent Garden, London. Letters on business should be sent to the PUBLISHER. The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper.

Names of plants.—A. T. Maw.—1, *Acer Negundo*; 2, possibly an *Amelanchier*, but without flower, fruit, or description it is impossible to say positively; 3, *Berberis vulgaris* (common Barberry); 4 and 5, *Phillyrea media*; this varies considerably in the shape and serratures of the leaves; 6, *Acer Negundo variegata*; 7, *Mespilus Smithii*; 8, one of the cherries, but cannot name from such a specimen; 9, *Campanula carpatica*; 10, *Thujopsis dolabrata*.—Medway.—The Oak is *Quercus dentata*, a native of Japan; the other specimen was, unfortunately, too small for identification.—R. Hooper.—1, *Virginalis Foke* (*Phytolacca decandra*); 2, *Gentiana asclepiadea*.

Destroying ants (A.).—Try *Beetlecut* for ants. You can get it from Messrs. Burgoyne, Burdidge and Co., 16, Coleman Street, London, E.C. It has been strongly recommended to us.

W. M., Aylth.—This is probably due to the trees being in a poor wet soil or natural decay. Your first letter must have gone astray.

Ornithogalum nutans (A. M., Ambleside).—We are quite unable to account for the non-flowering of the above. Usually it is a troublesome plant in gardens, and we can only imagine that some peculiarity of your soil may account for it. In the soil you describe the plant should grow, increase, and flower quite well. It is rather late for the operation, but you may give it a trial, and at once lift some of the bulbs, provided the new roots are not yet emitted, place in a dry, airy shed or outhouse, and, after a month's rest, replant them in well dug ground and in a perfectly open position. In not a few instances we have in mind the plant succeeds well at the base of a sunny wall, and if you have such you could replant a portion of the bulbs in it. Four inches deep will be ample for the bulbs, and a little bone-meal or old mortar will do no harm mingled with the soil.

Phloxes falling (E. HUTCHINSON).—We can find no apparent cause in the example submitted why the Phloxes should have failed. Yet we surmise the actual cause to be either general deterioration of the plant or clump from long occupying the same position, or to wireworm, or other mite-boring insect having early attacked the stem near the ground. We note the stem sent is much underized, as though attacked quite early in the season. You give no idea as to whether the falling stems are near the centre of the clump, or if, indeed, they occupy any special position at all. And you do not state the length of time the plants have been in position. These herbaceous Phloxes are not likely to suffer in such a soil as you describe if generously treated. What these things prefer is replanting now and then, coupling the operation with deep digging and heavy manuring. In these particulars you can hardly err on the side of generosity. If, however, the soil is heavy and of a close, tenacious character, a good dressing of road grit or fine mortar rubbish would assist to better its condition. We advise you to replant the Phloxes, discarding all the woody internal portions of the clumps, and selecting the outer and more vigorous stems. Plant these singly to the extent of five or so over a ground area of 18 inches. Such work may be done in September or October, and in this way a good flowering may be ensured next year.

Clove Carnation (SPEEDWELL).—The old Clove is merely a garden form of the border Carnation, a group that has been brought to its present perfection through generations of cross-breeding and selection from seedlings. The above, in point of fact, possesses no Latin name, but the progenitors of this now famous race is known botanically as *Dianthus caryophyllus*, a species in the wild form, which is quite single-flowered. Therefore, the entire race of Carnations is technically *Dianthus*. The name has fallen into disuse, and the more popular names, as *Clove Carnation*, *border Carnation*, *tree Carnation*, *Plottee*, &c., serve to both classify and indicate the types to which the names refer. You will obtain what you require by using the term old crimson *Clove Carnation*, as no plant is more popular or better known. The best way to secure a bed of this plant in flower next year is to obtain freshly-rooted layers in September or October, and if the Carnation is quite hardy in your district, and will stand the winter, plant in a well-prepared bed at once. If you have doubts about the complete hardiness of the plants, we then advise that you pot the plants in pots of 4½ inches diameter, and place them in a frame for the winter season, or, instead of planting in pots, you may plant them in the frame in prepared soil. In March or April, 1904, you could then lift them, each with a large ball of earth and roots, and arrange them in the flower bed previously prepared for their reception. In this way you would be sure of good plants. The soil of the bed should be 18 inches deep at least, and best if of good loamy soil and much fibre with it. Well rotted manure from the stable may be dug in and so placed that it will be 9 inches from the surface of the bed. This work should be done in the autumn. Just before planting time you may give a liberal dressing of bone-meal on the surface, and lightly dig it in when putting in the plants. These should be planted quite firmly, and given a good watering if the weather is dry

at the time. By following this method you should secure a good display of flowers. Other good sorts are:—*Alice Ayres*, *Ketton Rose*, *H. J. Cutbush* (scarlet), *Pride of the Garden* (rose), *Lady Waidie Griffith* (crimson-claret, *Clove* scented), *Hon. Harry Escumbe* (yellow), *Lady Tweedmouth* (terracotta), *Miss A. Campbell* (soft yellow), *Hon. Adele Hamilton* (rose-pink), *Mrs. E. W. Mather* (yellow and pink), *Uriah Pike* (crimson, *Clove* scented), *Dundas* (scarlet, very free), *Countess of Paris* (very fine), *Glory de Nancy* (pure white, *Clove* scented), &c. A beautiful white is *George Maquay*.

Filbert trees falling (R. F. B.).—As regards the tree which appears to be dead, we think it futile to try and restore so old a specimen, and would prefer to clothe its trunk by planting climbing flowering plants and *Virginia* creepers at its base. Some of the best subjects for this purpose are the early and late Dutch *Honeysuckle*, *Clematis* *Jackmanii*, and *Montana*; some of the strongest-growing *Roses*, such as the *Crimson Rambler*, *Almée*, *Virbelt*, or *Reine Olga de Wurtemberg*. Should you prefer to try and restore the old tree, the best way to set about it will be to cut away some of the dead wood, including the decayed part of the limb spoken of, putting on this a patch of thin lead to prevent water penetrating the trunk of the tree. Take 6 inches of the surface soil off for a distance of 5 feet round the stem. Give the tree a good soaking of liquid manure from the stable-yard if available; if not, dilute the water with *Peruvian guano*. A good soaking should be applied every other day for a week to make sure that the roots have been reached. Afterwards, top dress the roots to the depth of 5 inches with ordinary garden soil, to which has been added its own bulk of rich, well-rotted manure. The other two trees should have all the dead wood cut out, and where branches have been removed the cut part should be covered with thin lead sheeting, fastened into the trunk with brass nails. This will prevent the ingress of water, and arrest the further decay of the trees. Serve these the same, as regards watering and top dressing, as advised for the sickly or dying tree.

American blight (AMATEUR).—Point No. 1: It will be sufficient to paint the diseased spots with the emulsion in winter only, keeping a sharp look-out in spring for the reappearance of the blight before it can communicate itself to the young growth. Apply the emulsion on its first appearance. If this is continued with persistence during the summer freedom from its future ravages will be obtained. Should it happen that neighbours have trees similarly affected, it is a hopeless task to quite get rid of this pest, as by means of high winds it may be communicated from one garden to another, though they may be situated a quarter of a mile apart. In Germany and some other parts of the Continent, where the fruit crops of the country are considered of great importance by the Government, laws are enacted compelling owners of orchards and gardens, under a heavy penalty, to keep their trees free from this and other pests. An agitation has been recently set on foot in England favouring a similar enactment, and until this is enforced immunity from this troublesome pest will never be effected. Point No. 2: The turf need not be burnt. This blight, as far as is known, winters in the bark and crevices of the trees, and does not injuriously affect the turf. After taking up this should be heaped up into a stack, and in the course of four or five months, when the grass has perished, it will be found a useful and valuable mould for planting trees in or for potting. The ground round the trees after the turf has been taken off should receive a good soaking of manure water from the stable or cowyard. Afterwards, when the ground is comparatively dry, the surface should be forked over to the depth of 2 inches or 3 inches, and the top-dressing previously recommended should be applied. Spraying is effective against the ravages of green or black fly and against mildew, but not so effective against this blight.

Herbaceous borders (J. PRICE).—In the first place, the entire area to be devoted to the above should be deeply trenched and heavily manured. September and October are good months for the work, especially if the more showy things are desired. At the same time, the above season permits of the inclusion of bulbous plants as well as the usual hardy flowers in variety. As you appear to have ample space you should be able to accommodate the bolder things, which in other circumstances would have to be excluded. Of these we may mention *Bocconia cordata*, *Hollyhocks*, *Helenium nudiflorum*, *Helianthus orgyalis*, &c. These, when established, save the *Hollyhock*, would be 5 feet or 6 feet high. We think the best way of advising you will be to give a section of the border arranged with the plants in position. We note the borders are in parallel lines. This need not prevent you from placing the groups of plants irregularly if you prefer it to the straight lines. To group it in any less formal way a good knowledge of the established plants is necessary. Assuming the 5 yards is wholly at disposal, we suggest the following as a sectional portion arranged: In the back line, take *Helenium nudiflorum* (crimson and yellow), *Bocconia cordata* (creamy buff), and *Hollyhock* of a rose shade. These are bold subjects, and should not be closer than 3 feet asunder. Alternating with these in the next row, which should be at least 3 feet from the above, taking the centre of plant as the line, should appear *Aster cordifolius elegans*, *Helianthus multiflorus* var., *Aster arcturus*, and *Lathyrus latifolius roseus*. Again, in the same way in the third row, *Lilium testaceum*, *Harpalium rigidum*, *Anemone japonica alba*, *Aster turbinellus*, and *Lilium candidum*. In the fourth line, *Aster horizontalis*, *Doronicum Harpur Crewe*, *Galearia candelabra*, and *Achillea Ptarmica flore-pleno*. In the front line, *Geum coccineum*, *Heuchera sanguinea*, *Aster alpinus*, *Tiarella cordifolia*, and *Iris nudicaulis*. Then by carpeting the foreground and permitting the plants to spread towards the front row with *Sedum*, *Saxifrage*, *Aubretia*, *Pinks*, &c., you may secure a border showy and good, and with a considerable profusion of bloom. We will now give you a list of plants with their approximate height, although it seems necessary that you should have expert advice either on the spot or a plan to work by to obtain a good effect on so large a scale. The following are plants of 5 feet high or more:—*Aster Novi Belgii*, in variety, *A. N. Angliæ* in variety, *A. cordifolius*

var., *Helenium nudiflorum*, *Bocconia Hollyhock*, *Campanula pyramidalis*, *Delphinium*, *Helianthus multiflorus* (various), *Polygonum* (tall kinds), *Kniphofia* (various), *Helianthus orgyalis*, *Pyrethrum serotinum*, *Eremurus robustus*, *Iris ochroleuca*, *Aconitum Flaberi*, *Cimicifuga*, &c. The following are 3½ to 4½ feet:—*Achillea eupatorioides*, *Campanula lactiflora* and var., *Aquilegia chrysantha*, *Lilium testaceum*, *Asters* (perennial, various), *Acanthus*, *Eryngium*, in variety, *Eremurus himalaicus*, *Thalictrum* (tall kinds), *Galearia candelabra*, *Phloxes* (various), *Iris sibirica*, *perennial* *Pea* in three kinds, *Helenium*, *Aconitum*, *Astilbe rivalaris*, *Lupinus*, *Verbascum*, *Sidalea*, *Spiraea Aruncus*, *Veratrum*, *Echinops*, *Lilium candidum*, *L. croceum*, *L. speciosum* in many beautiful kinds, *L. Martagon*, and *L. tigrinum* in three vars. The following are from 2½ feet to 3 feet high:—*Phloxes*, *Gladiolus Lemoinei*, *Agrostemma*, *Achillea*, *herbaceous* *Peonies* in variety, *Lychnis chalcedonica*, *L. vespertina plena*, *Incarvillea*, *Montbretia*, *Columbines*, *Campanula grandis*, *C. persicifolia* var., *Doronicum*, *Stenactis speciosa*, *Trollius*, *Veronica subaequalis*, *Oriental Poppies*, *Chrysanthemum maximum* of sorts, *Rudbeckia purpurea*, the taller varieties of *Iris germanica*, *Gaillardia*, &c. Of still smaller things are the dwarf *Iris*, also the bulbous *Iris*, *Alstromeria*, *Fritillaria*, *Anemone sylvestris*, *Pyrethrum* (various), *Potentilla*, *Polemonium*, *perennial* *Cornflowers*, *Lychnis Viscaria* var., *Lenten Roses*, *Geums* (various), dwarf *Columbines*, *Rudbeckia Newmanii*, many *Narcissi*, *Anthericum*, *Inula glandulosa*, *Campanula carpatia*, *Coreopsis*, *Heuchera*, *Hemerocallis* of sorts, *Carnations* in variety, *Physalis capensis*, *Statice latifolia*, *Doronicum caucasicum*, &c. While of still dwarfier things in the front line are *Adonis*, *Hepatica*, *Primulas*, dwarf *Phloxes*, *Arnebia*, *Asters*, *Scilla*, *Christmas Rose*, *Muscarias* of sorts, *Narcissi* (various), *Chionodoxa*, and many more, apart from the carpeting of quite dwarf things already given. You must quite understand how difficult it is to advise without seeing the garden, but we have done the best we can. You might introduce *Roses* into the border—*Marie van Houtte*, *Edith Gifford*, and the scarlet *Princesse de Sagan*.

TRADE NOTES.

INTERESTING INVESTIGATION.

MR. JAMES L. WOOD (of William Wood and Son, Limited, specialists to His Majesty the King) is about to visit some of the principal places in the North on his way to Scotland, where he will investigate the results of fungoid and other diseases on the various crops this season, and the effect that "Velthe" has had upon them. For this purpose it is his intention to traverse the country as far north as Inverness, and afterwards proceed to Ireland. During his journey Mr. Wood will be pleased to make special calls. Consultations may be arranged for by letter addressed to William Wood and Son, Limited, Wood Green, London. A very concise pamphlet has been published by the firm, entitled "The Rational Method of Treating Fungoid Disease." The book is sent post-free on application.

NEW DAFFODILS.

THE beautiful new hybrid *Daffodils* described in Messrs. Barr and Sons' catalogue are the result of many years of labour in cross hybridising. Among them we notice *Peter Barr*, the largest and purest white trumpet *Daffodil* yet raised. Messrs. Barr and Sons' catalogue also contains some valuable practical hints to amateurs on the cultivation of the *Daffodil*, which should be read by all growers of this spring flower.

GARDENING APPOINTMENTS.

MR. W. HARP, gardener at Shirley House, Shirley, Croydon, succeeds Mr. George Sage as head gardener to Marquis Camden, Bayham Abbey, Lamberhurst. He enters upon his duties early in October.

MR. E. GUILF, for the past six years foreman at Ascott, Bucks, under Mr. Jennings, and formerly at Iwerne Minster Gardens, as head gardener to Carl Meyer, Esq., Short Grove, Newport, Essex.

PUBLICATIONS AND BOOKS RECEIVED.

Journal of the Portuguese National Horticultural Society (May and June), Agricultural Experiment Station, Kingston, U.S.A.; Fifteenth Annual Report, Michigan State Agricultural Society Experiment Station; Fertiliser Bulletin, by Floyd W. Robinson; The Living Plant: A Popular Book on Botany, by A. E. Knight and Edward Step, F.L.S., Part I, price 7d. nett, Hutchinson and Co., Paternoster Row.

We have received from Messrs. George Newnes the *Wide World Magazine*, *The Captain*, *The Strand* and *Sunday Strand Magazine*, and the nineteenth part of the *Century Book of Gardening*.

The September number of *The Studio* will contain two articles upon the subject of the late Mr. Whistler, and a number of important illustrations of his works, including three reproductions in colours and other supplemental plates.

CATALOGUES RECEIVED.

Bulbs.—Messrs. Fisher, Son, and Sibray, Handsworth Nurseries, Sheffield.

Bulb Catalogue for 1903.—Messrs. J. Veitch and Sons, Limited, King's Road, Chelsea, London.

Bulbs and Strawberries.—Messrs. Vilmorin and Co., 4, Quai de la Mégisserie, Paris.

Carnations and Bulbs.—Messrs. Cutbush and Son, Highgate, N.

Flower Roots.—Messrs. Dicksons, 1, Waterloo Place, Edinburgh.

Tulips and Daffodils.—Messrs. William Baylor Hartland and Sons, Patrick Street, Cork, Ireland.

Carnations and Plottees.—Mr. Joseph Lambert, Dalmeny, Westmoreland Road, Southport, Lancs.

*. The Yearly Subscription to THE GARDEN is: In 15s.; Foreign, 17s. 6d.

THE GARDEN

No. 1660.—VOL. LXIV.]

[SEPTEMBER 12, 1903.]

THE RIGHTS OF THE RICH.

LATELY the daily papers have been calling attention to many acts of vandalism committed by tourist visitors to Welbeck, Clumber, and St. Michael's Mount, showing that there has been abundant provocation for the restrictions now placed upon the privileges hitherto enjoyed.

Much thought is expended in the present day upon the sorrows of the poor and needy—and justly. It is time to look at the reverse side of the picture as well and consider for a moment the rights of the rich and noble.

Amongst savage peoples that tribe is barbarous indeed which does not honour a "covenant of salt." The traveller who is admitted to the hospitality of the tent fears no danger, yet he is at the same time aware that pains and penalties await the breaker of the pact. It remains, it seems, for modern civilisation to set at nought an unwritten law held sacred throughout the ages. No country is richer than our own in venerable historic homes, and, as a rule, all of these which possess any claim to public interest are most courteously and liberally lent on occasions for the enjoyment of all and any who may wish to become acquainted with their world-famed precincts. A feast of the eye is offered, and to enter the hospitable gates is to taste of the salt of the covenant. At least, therefore, the guest is pledged to good manners.

There is hardly a word strong enough to indicate the man who abuses the privileges placed at his disposal by the kindness of his betters, but therein, unhappily, lies the rub. A false morality has taught that in the genus Homo there should be no "betters," and clamours that the inherited possessions of the privileged few should belong of right to the many. The fallacy of such reasoning is shown plainly enough by everyday experience. We have but to recall the new-made grave at Hatfield to confess that by race and by position, by attainments and by character, there are men who stand head and shoulders above their fellows. So it always will be, and probably the most gifted are the foremost of all to acknowledge their own limitations.

An Englishman's home is his castle. The old adage is forcible, and we can hardly expect the lord of the castle to strip himself of every right which it is the glory of the lowliest English cottager to call his own.

Public gardens and parks are to a certain extent held inviolate by the disciple of so-called Liberty, Fraternity, and Equality. By a fine stretch of imagination he claims a sense of private ownership therein on account of an infinitesimal fraction of rates or taxes which may—or may not, as the case happens to be—pass from his pocket into the Government treasury, and woe be to the heedless lad whom he catches infringing in the smallest degree on his "rights." The same person, when allowed by the courtesy of its owner to visit a beautifully laid out garden or park, will forget all about rights, and, when the back of the custodian is turned, will help himself to flowers or stealthily pilfer fruit which he takes good care to secrete, or in other senseless and ill-bred ways oversteps the limits of his invitation. So he and his brotherhood by continual reiteration of such petty annoyances, at length weary out the kindness which—often at considerable self-sacrifice—has thrown open private gates, and they are closed upon the decent public, who are thus debarred from much pleasure and profit.

We would fain believe that only a very small proportion of English men and women come under such a category. It is, however, undoubtedly the case that holiday makers—and not always those alone who belong to the "tripper" class—do seem, for some occult reason, to lose their heads and their good manners completely, and often conduct themselves in a fashion of which they themselves would be ashamed under everyday conditions. Sheer exuberance of spirits may account in a measure for such thoughtlessness, but, unfortunately, it is too late to repent when the mischief is done. Hospitable gates once closed by reason of trespass do not easily reopen.

It has been suggested that more stringent rules should be made compulsory, but though the power of legislation is mighty, it is not almighty, as we are very apt nowadays to think. Reformation must come from within, in most cases, rather than from without. There is, however, too much sound common-sense, not to say good feeling, amongst us as a nation not to bring strong public opinion to bear upon and put an end to such wanton misdoings as have been reported from Welbeck and Clumber. The vast majority of good citizens understand perfectly that traditional mansions and grounds are opened to them not of right but of the kindly feeling and courtesy of their owners, and repay it by the measure of their self-controlled enjoyment and appre-

ciation. Against sightseers of this worthy type we feel sure that the historic gates of Great Britain will never be closed.

SHREWSBURY FLORAL FETE.

AN APPRECIATION.

THIS great exhibition combines many examples of the best gardening in Great Britain, not in isolated sections, but it includes almost every plant the gardener can grow, and offers liberal and tempting prizes for their production. Thus is annually brought together, at enormous cost of money and labour, a horticultural exhibition of such magnitude, interest, variety, and beauty of garden produce as can hardly be seen anywhere else. I think it may with justice be said that a great exhibition such as this undoubtedly is is well deserving of the term "national," and nothing would rejoice the hearts of British horticulturists more than to hear of the great service it has rendered to the national industry of horticulture being recognised by the bestowal of a Royal Charter. Some who are unacquainted with the value of the work so unostentatiously but successfully carried on for the past twenty-nine years may be inclined to ask what entitles it to this great honour. The best answer to this question I think can be given by briefly drawing attention to some of the more prominent features of the exhibition held on the 19th and 20th ult., in many respects the best of a long series.

Taking the plant section first, in the class for large specimen plants there are brought together such examples of British skill in the art of plant growing as are never seen at any other exhibition. Take again the art of grouping plants for artistic effect, at no other show is this important aspect of gardening more encouraged or a better exposition given of plant arrangement. It was the general opinion of those well able to judge that in the tent in which these plant exhibits were arranged a richer or more diversified collection had never been seen before in one tent at this time of the year.

It would take too long and occupy too much of your valuable space to place before your readers in anything like detail the many interesting and varied aspects of this show, and I will only refer briefly to its more important features. The remarks I have made as regards plants refer only to the great open class; there are other classes provided for all manner of plants in season, and every one was well filled. The cut flower section embraces every flower which may be had in bloom at the season, from the rarest Orchid to the commonest hardy flower. We often hear of the great stride which has taken place of late years in the improvement of hardy herbaceous plants. Hearing is one thing, and seeing is another. At Shrewsbury this is forcibly demonstrated in the rich, varied, and extensive collections brought together. It is not only high quality and variety that are encouraged, but what is of equal, if not greater importance, the art of putting them together in the most natural and artistic way. To this end handsome and valuable money prizes are offered. In respect to bouquets, epergnes, baskets, wreaths, and flower designs such as harps and anchors, &c., perfection has almost been attained.
